WON

This year's

TOURIST TROPHY

IN INDIA

Mr. J. Corder, the winner, writes: I have much pleasure in informing you that I have just won the Indian T.T. race, 270 miles with my gallant Model R. I have had my machine just over 10 months and have done little short of 4,000 miles without a single replacement. Another Douglas ridden by Mr. Conyers was Second.

DAVISON'S CATALOG.

THE BOOK YOU WANT IN TROUBLE

IS SENT FREE AND POST FREE TO ALL WHO ASK.

Full of well-proved absolutely reliable Inventions that economise oil and petrol and enhance Motor Cycling pleasure by doing away with trouble and by improving efficiency. Inventions wanted by all, and should be fitted to all Motor Cycles, new or old. Write to day for a copy of this useful book.

The 2-STROKE OIL DISPLACER.
Provides exact perfect lubrication for 2-stroke engines, Triumphs and all makes.

THE DAVISON OIL & PETROL GAUGES.
First and only perfect Gauges enabling contents of Tank to be seen while riding.

THE DAVISON TANK.
First perfect Tank invented. Full of best up-to-date improvements.

SHUT OFF DRIP FEED OILER.
Allows lubricant to be shut off without disturbing needle valve.

THE DAVISON OILER.
Gives continuous visible drip feed lubrication which can be regulated at will while riding.

SPARE PETROL TANKS.
In stock ready for delivery for all leading makes of Motor Cycles.

WARNING TAP WITH BYEPASS.
Warns rider when stock of petrol is getting low.

PETROL FILTER.
Fits in petrol pipe and prevents water or any impurities from entering carburetter.

Transparent Unbreakable Stopper.

The only Speed Ind... that is steady and acc...

Note the clear, open dial (actual size) which is attached to the handle-bar and can be read at a glance.

With so many speed limits in force a reliable indicator is a necessity.

Instruments built on Centrifugal or Magnetic principles cannot possibly give satisfaction on a motor bicycle, and only end in disappointment and failure.

The COWEY is positive throughout and is therefore reliable always. The hand is perfectly steady at all speeds, a feature which is absolutely impossible in any other indicator.

The Cowey Patent Speed Indicator

is BRITISH MADE and Guaranteed against Repair Charges for 12 months.
Can be fitted to any type of Spring Fork and to the right or left-hand side of wheel.

PRICE COMPLETE **£4 - 4s.** Registering from 5-40 or 10-60 m.p.h., with Mileage Recorder, as illustrated.

Or with Trip, **£5 - 5s.**

Registering from 10-80 m.p.h., **£5 - 5s.**

Or with Trip, **£6 - 6s.**

Maximum Speed Hand, **10/6** extra.

The Problem of the Noisy Engine.

FOR many a year now purchasers of cars, even of the cheapest variety, have obtained a considerable degree of silence and refinement in the running of the engines supplied. Indeed, it is doubtful if a car engine with really noisy valves or cams would find any purchasers at all. But, unfortunately, this is not generally the case with motor cycle engines—at any rate, those of the four-stroke type. Now the average motor cyclist is probably far more of an engine expert than is the average car user, and, as such, he ought to be a trifle more critical as regards refinement and not quite so insistent on mere power and vim. It may be retorted that most motor cycle engines are limited to a greater degree than car engines in the number of their cylinders, and are thus less likely to afford smooth and quiet running, while, of course, inside flywheels are not so conducive to quiet even turning as the larger diameter, though lighter, outside variety universal on car engines. In these days of high-priced sidecar outfits, which in some cases cost about as much as a small car, buyers have the right to expect engine and transmission silence for their money. Indeed, it should be possible for the driver and passenger of such an outfit to converse as easily and with as little raising of the voice as on a car, always allowing for the presence of a greater volume of air rushing by owing to the absence of a windscreen. But, alas, it is not often so. Probably the suppression of the exhaust noises by the Local Government Board has accentuated cam rattles to the ear of the rider, and now that the L.G.B. has overcome one noise, it is up to motor cycle manufacturers to produce engines devoid of valve clatter.

Protected Engines the Solution.

IT does not take any great mental effort to understand that it is perfectly possible to put the same high quality of material into a motor cycle engine equally well proportioned to its work and in every way as well fashioned as are similar parts in the most expensive car engine, and, therefore, on the face of things, a motor cycle engine should wear quite as well as its larger brother in the four-wheeler. We do not think that it is far to seek to discover the cause of this unfortunate state of affairs. We believe we are correct when we say that rapid wear in motor cycle engines is almost entirely due to external and not to internal causes. It is simply caused by the continuous dust and foreign matter thrown up from the road and settling on every moving part of the engine. Some effort is now made to exclude road dust from passing into the cylinder *via* the carburetter by the fitting of gauzes, but another entrance for foreign bodies, and perhaps the greatest offender of all, is *via* the valve tappets.

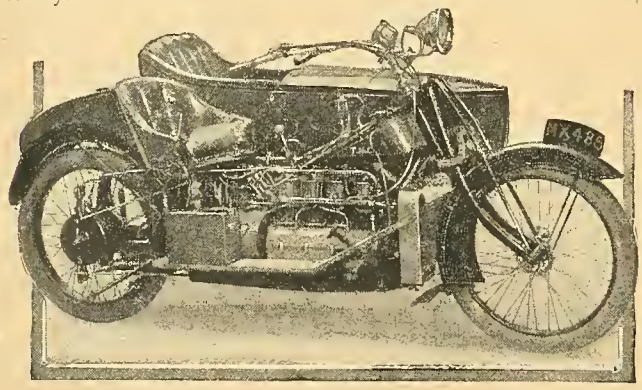
Naturally, continuous ingress of minute grit when constantly conveyed to moving parts of machinery will rapidly cause disintegration. It may be retorted that valves should be enclosed as on car engines, but unfortunately with an air-cooled motor it is highly undesirable to shut off any portion of the cylinder from the cooling air, and to obtain complete immunity from this vexatious cause of trouble it may possibly in the future be necessary to employ a different type of motor from that which now obtains. The success of the slide valve engine in the recent Isle of Man car races points unmistakably to the fact that this type of motor can be run at a very high rate of revolutions, and this would indicate that there is no radical reason why such types of engine should not be possible for motor cycles. Here we should have at once a complete exclusion of dust, dirt, and wet, and equally important a very large measure of silence.

We cannot believe that our manufacturers will remain dormant under the stimulating example set them in the Isle of Man, and we are so bold as to look forward with confidence to the ultimate triumph of the internal combustion engine for motor cycles with totally enclosed valve mechanism.

The T.M.C. nearing the top of a steep incline in a lane near Haslemere.

AT this time of the year a tour through country possessing wooded hills is always sure to please. With a comfortable, or, better still, a luxurious sidecar combination such as the T.M.C. to travel in, the ability to appreciate the beauties of nature is accentuated, for physical discomforts which arise through an unreliable mount divert the attention and very soon take the edge off one's appreciative faculties.

This machine is fitted with a four-cylinder water-cooled engine, three-bearing crankshaft, and large Ferodo cone clutch, three-speed gear box, which is provided with operating mechanism in the form of a quadrant, and shaft and bevel final drive, which in proper adjustment will wear well, run silently, as well as being positive in action. A point of luxury is the bucket seat, allowing long journeys to be taken without an aching back or feeling of soreness resulting. Even if the regulation type of saddle were utilised the machine would be comfortable, for the rear springing is excellent. The sidecar track is slightly in excess of what is usual, but this design leaves plenty of room for the positioning of the springs upon which the body is mounted. There is no doubt whatever that this attachment is as free from vibration as any other type it has been our pleasure to try.

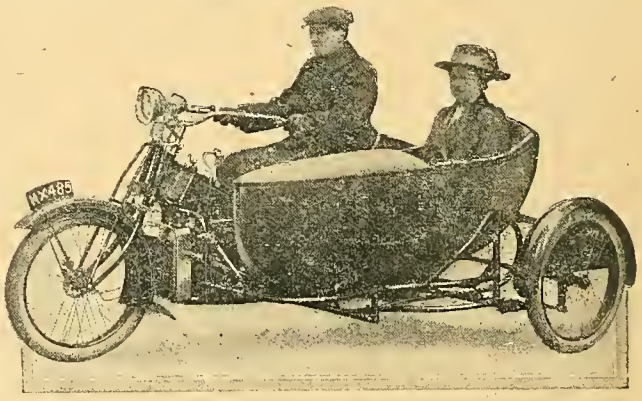


Offside of the T.M.C. sidecar outfit, showing footboards, radiator, bucket seat, and rear springing.

In selecting a course for a trial run, it was decided to take the outfit down into Surrey, where hills abound and roads are good. With this aim in view, the exit chosen from London was *via* Hammersmith Bridge, straight through Roehampton, and thence to Kingston.

On the Portsmouth Road.

Rumours of police activities at Cobham enforced a speed within the legal limit for some distance, for no one was quite certain as to the whereabouts of the trap, which was known to be working in this locality. Once through the danger zone, with the aid of a fully opened throttle, 40 m.p.h. was soon recorded on the speedometer, in spite of the heavy head wind. At this speed the running was very sweet, but even in accelerating up to this velocity no unpleasant periods of vibration were passed through, which speaks well for the way in which the various components of the engine are machined and balanced. Guildford and Godalming were passed through slowly. Taking the Haslemere Road at Milford, a series of long hills and sharp corners brought forth such salient features as power and smoothness of brakes, easy steering, together with marked capabilities of hill-climbing, which would prove to the most conservative of single cylinder experts that there is a future for the four-cylinder

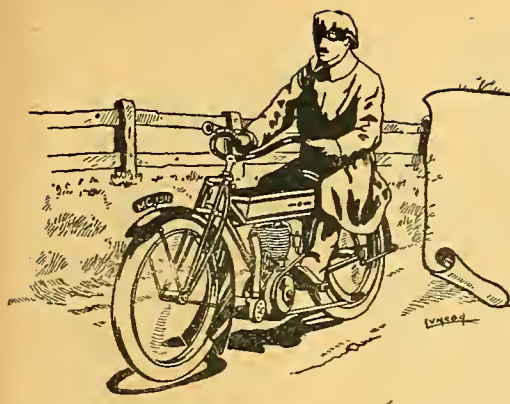


The four-cylinder T.M.C. sidecar outfit ready for the road. Note the efficient method of springing the sidecar.

motor cycle designed on correct principles, with a careful eye for the initial cost.

It was on the section from Haslemere to Midhurst that the steepest gradient was encountered, but this would not have been considered out of the way at all had not a stoppage taken place in order to scrape the Ferodo clutch lining, because, through lack of attention, its surface had worn hard and smooth at the expense of the necessary friction required to transmit the power without loss occasioned by slipping. But for this little interruption, every hill would have been climbed on top, although the highest gear ratio employed is perfectly normal.

A return was made through Cowdray Park, a beautiful estate which time would not permit us to explore, thence through Northchapel and Chiddingfold to Godalming. The journey back to town took a comparatively short time, even though a halt was made at the popular Wisley Hut for tea. It should be mentioned here that Guildford High Street was taken on top, quite a commendable performance when one considers the gradient and the compulsory slow speed limit at which it is necessary to negotiate it.



Round Scotland on a Borrowed Motor Cycle

Experiences, Instructive and Otherwise, which befell one of "The Motor Cycle" Representatives.

AT the last moment I was compelled to take a borrowed 3½ h.p. chain-driver as my means of locomotion to the Car T.T. in the Isle of Man, and in the Scottish Six Days. The machine was a somewhat aged sample, guaranteed by its owner to be in splendid tune, and equipped with enclosed chain drive and a 500 c.c. engine, kick starter, and three-speed counter-shaft gear. I had originally offered to escort a novice, who had just bought his first machine at second-hand, from the Midlands to Liverpool. We took half an hour to cover five miles, after which—in his interests—we ignominiously took the train. He was a fair sample of the handicaps under which the trade prospers. Some unscrupulous agent had sold him a 1913 mount in rotten condition; it could not exceed 25 m.p.h. on the flat, nor climb a long grade of 1 in 17 with any certainty; nor had he the least notion that the machine was seriously amiss. I waited fifteen minutes for him five miles out, and he told me he was "all out." I examined the machine, found it had no compression, and that the front chain of the two-step drive was actually so loose that it was jumping the teeth of its sprockets. I took him back home, lent him one of my machines, and we caught the train to Liverpool. Incidentally, his own engine seized up solid on his return journey.

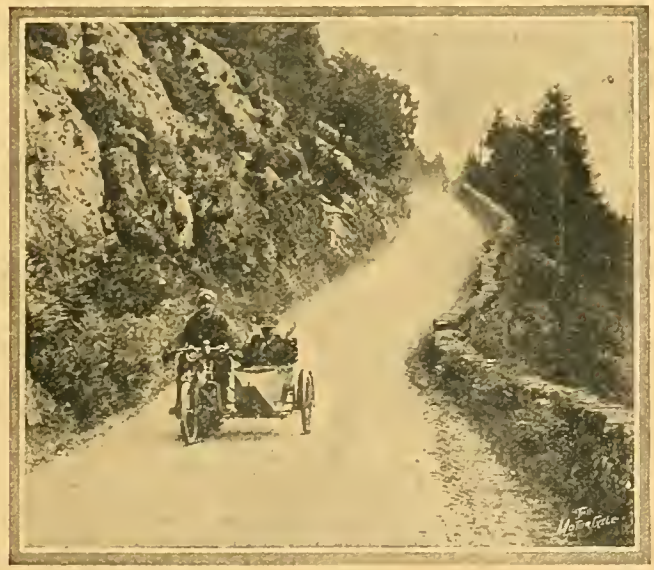
Trials other than Scotch.

In the Island my chain-driver proved all one could desire, giving no trouble of any sort or kind, and climbing the rough hairpinny ascent of Sulby Glen on second gear, which augured well for Scotland. On arrival in Edinburgh I was immediately stopped by the police for dangerous driving. As a wag says, the T.T. makes one oblivious of speed limits, and the Scottish Trials make one drive as if there could never be anything or anybody round a blind corner! I managed to see everything of interest on the Monday's run, though I had cartloads of trouble. *Inprimis*, my engine was lubricated by a drip feed operated by crank case suction through a non-return ball valve at the lower end of the pipe. This dodge is admirable in the level Midlands, but it floods the engine with oil during the descent of the long Scottish hills, for there was no tap to stop the drip. I had only one spare plug, and if carbonised plugs are cleanable, it is no easy matter to scrape burnt oil off the inside insulation. Furthermore, some wag had apparently put a teaspoonful of potting loam from an hotel flower pot into my carburetter. I cleared the jet several times, and finally dismantled the entire carburetter. Then I had a bad nail puncture, and finally the petrol union came away from the tank—one of the most awkward mishaps to "fake" imaginable. However, the machine took Amulree on less than quarter throttle, and as it was now pretty well tuned up, I looked forward to a comfortable week.

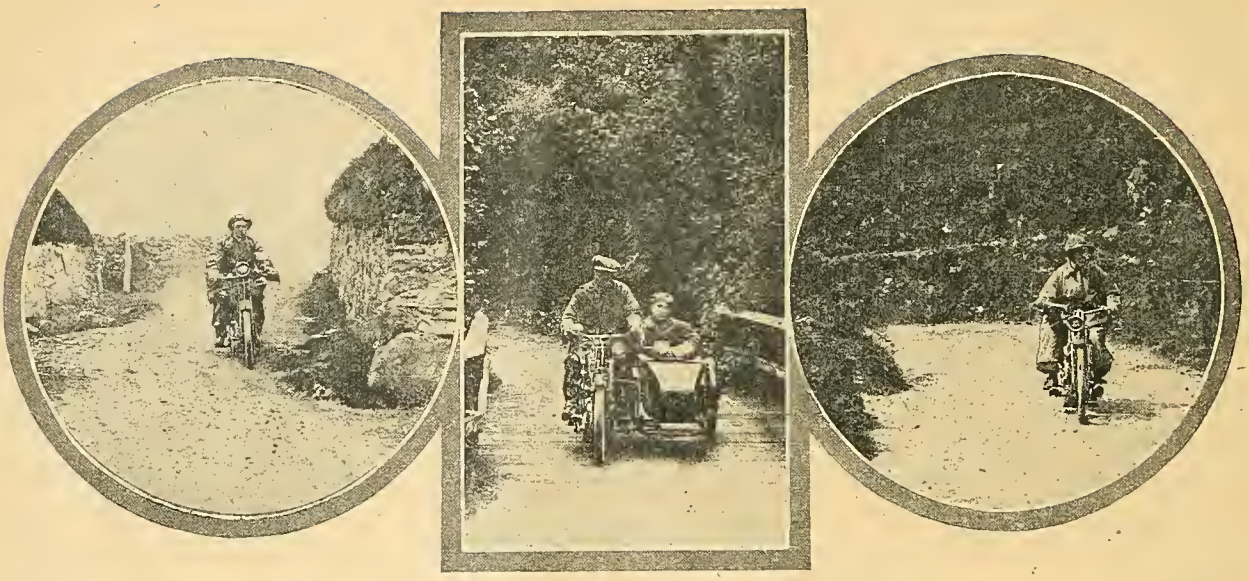
Hairpins Galore, and Poor Driving.

Tuesday was a very severe day, and the machine ran like a clock—absolute non-stop.

Wednesday ditto. I was the first man up Abriachan Hill, and thought nothing of it; but the subsequent ascents cut up the bad corner considerably—the first sidecar ploughed a rut several inches deep clean round the centre of the hairpin; and there was, perhaps, more excuse for the many failures than I was inclined to credit. Every Scottish Trial is the same in one respect. On the opening days the men who are sampling the Scottish hairpins for the first time bungle their speed and steering abominably. In previous trials the bad corners have generally been reserved till late in the week. This year the men had two hairpins on Amulree, one on Trinafour, two on Cairn-o'-Mount, eight on Cockbridge, two on Abriachan, and one on Gruinard, all in the first three days, not to mention countless others of minor severity; so there



A. F. Downie (5-6 h.p. Ariel sidecar) coming down the road to Drumnadrochit during Thursday's run in the Scottish Trials.



SCENES DURING THE SCOTTISH TRIALS

A Sunbeam rider passing old farmhouses on the moors.

W. E. Grange (6 h-p. Bradbury sidecar) coming down Abriachan Hill

Mrs. Hardee (3½ h.p. P. and M.) rounding one of the bends on Glendoe.

was some excuse for the initial failures. Many riders of repute were already near the danger line between gold and silver medals by Monday night.

Applecross, and Other Worries.

On Thursday I had a very trying day. I had been troubled by an intermittent leak in the back tyre, similar to one which worried other riders on the same make of tyres. The tyre deflated slowly. When in a hurry, one blew it up, and it lasted from ten to thirty miles. When one had a little leisure, one enquired into matters and found no sign of a leak, but the tube would not hold up half the day. On the Thursday morning the leak got worse, and out came the tube. One of the many patches which decorated it was "lifting." I pulled it off, cleaned and solutioned the tube, and got my patch ready. Returning to the tube, I saw a bead of ugly glutinous moisture oozing from the hole—evidently some patent puncture-sealing nostrum. The patch would not stick on the top of this mess; after some trouble, by holding the tube with the hole uppermost and draining the sticky mess round to the bottom, I got the patch to stick. When I blew the tube up, I found half a dozen other leaks, and the joint was also oozing the yellow sticky stuff. Out came the knife, and I slashed the tube in half, only to find that the spare tube was endless. Out came the wheel, a job which occupied no small time, as the axle nuts were rusted home on their spindle, so that it was very difficult to get both of them loose simultaneously; moreover, the hub-disc details of the rear chain case had been badly strained by the real owner and could not be induced to clear the sprocket all the way round. I now had a most fiendish "blind" to the summit of Tornapress, having lost over two hours on the riders. However, as the engine was a real "revver" and no more trouble cropped up, I got there just ahead of the riders, and cooled off lunchless in the thick blanket of white fog—lunchless, because as soon as the last men were over the hill, the first men were due back again, and it was not fair to descend in the fog whilst others were trying to ascend the rough tortuous track.

On the return journey, which was non-stop, I swopped machines for some miles with a retired competitor, who could not get up Tornapress at any price. I formed the impression that the works 'bus, which he was riding, had been tuned with an eye to Brooklands rather than Highland hairpins. The ignition was timed so fast that it conked like a shipyard of Sunderland riveters when it was picking up on the flat; very nice when it once got "revving," but how *could* such a mount be coaxed round the Applecross hairpins?

Transmission Troubles in the Wilds.

Friday was a terrible day. The machine ran like a Rolls-Royce to Glendoe. The last competitors to ascend had tailed out so badly that the trial was now miles ahead of me, and I resolved to take things easily on the way home, instead of scrapping madly after the main body. Gibson and Mundy came along on their withdrawn Morgans, together with two merry Scottish journalists on a plucky little Baby Peugeot, and we foregathered at the Whitebridge Inn a few miles over the summit of Glendoe for tea, little knowing what awaited some of us along the sixty-four miles which still lay between us and bed. Two miles further on my back chain broke; it did not jam and skid the wheel, as *confrère* "Ixion" is wont to allege in his more pessimistic moments—the machine simply freeled into a deathly silent stop uphill. I began with the plan of detaching the chain case to recover any fractured bits. Gibson, Mundy, and their passengers beguiled my labours with humorous remarks, mostly taking the form of prophecies that my frame or engine were on the point of dissolution, and that they would see me carbonised before giving me a friendly lift. The makers of the machine tell me that the chain cases on this mount had been badly strained; but at any rate the five of us reluctantly concluded that to dismount the rear chain case, we should have to take off the back wheel and both the front sprockets. So I waxed

Round Scotland on a Borrowed Motor Cycle.—

reckless; prising the top split of the case apart an inch or so, I fished out the broken ends of the chain with a bent wire, mended them, spun the wheel, heard no noises save such has had always characterised the rear chain case, and left the broken fragments of the chain to do their worst; what became of them is a mystery, for they never reappeared, though I drove for miles with a finger on the clutch control for fear of an almighty jam-up.

A Novel Method of Starting.

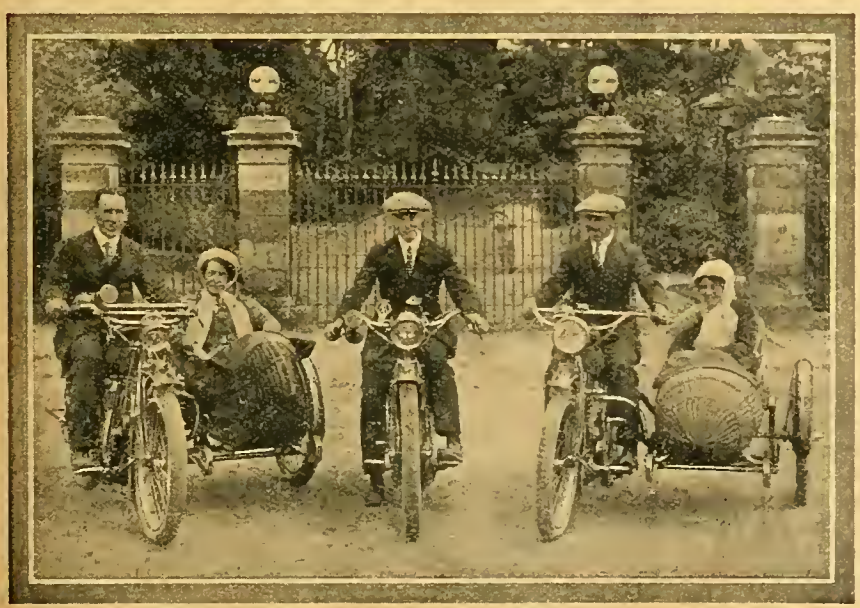
After this all went well till we hit the lovely speed straights near Cawdor, where I had the fright of my life. I heard a terrible uproar astern, and looking round saw the two Grand Prix Morgans coming up behind me, one on each side of the road at a level sixty; and Mundy, I knew, was running on the canvas of his back tyre. I wriggled hastily to one side and let them through. These two machines, by the way, were hunting in couples because one of them would not start on the handle, and so the other used to tow it off by a rope which the passenger held. The groans of the passenger if the engine did not start within fifty yards, and the rope half cut his palm through, were frightful to hear. I let their dust subside—this took about ten minutes, and then "blinded" off after them. Presently my engine began to get very hot, and glowed between my calves like a live coal. I oiled it up vigorously and slowed down. Clouds of blue smoke followed me, but it got hotter and hotter. I stopped and investigated to find the crank case drain plug missing. At a friendly smithy near by I got a huge rusty bolt, which I lashed into the orifice with wire and proceeded. At this point our photographer turned up. His own machine had broken its forks, and he was riding a borrowed twin, which would not look at Glendoe, and could only do 25 m.p.h. all out. He had been compelled to go round by Drumnadrochit and Inverness after snapping the men on Glendoe, and was looking a thought weary.

Rags and Patches.

We rode on together, and about 9.30 p.m.—fifteen miles from the night's destination on top of a lonely moor in the rain—he punctured! His stand had already collapsed, so we laid the machine with the belly of its engine on a bank, and one of us steadied it whilst the other repaired the tube, which, incidentally, showed an enormous blister just by the valve. While we were thus busy the Baby Peugeot arrived, and we noticed that the neck of the umbrella coat, which was its driver's chief pride in life, looked rather ragged. He explained that eleven punctures had exhausted their supply of patches, and he'd had recourse to his coat collar. We got going, and overtook them further on, with yet another puncture, and gave them patches. Dropping into Grantown, my engine developed the most frightful moans, presumably the results of the previous oil leaks from the crank case. A congregation of experts at Grantown dismally surmised either "con. rod" or "big ends," but after the 10 p.m. meal (the first since 7 a.m.) I fancied the noise came from the front chain case, and aided by the kindly P. W. Bischoff, we took the front chain case off, and found the chain sagging against a security stud, having stretched a whole link in the five days. As all the adjustments were at their limit, and the nuts rusted home, and the tools in the kit grossly inadequate, it took us nearly two hours to adjust the chain, and shortly after midnight a weary pressman retired to bed, only to be awakened by shrieks of merriment when the barman dropped a marble-topped table from the top of a huge tree outside, whither two or three merry spirits had conveyed it.

An Inglorious Finish.

Next morning it was proved in the first mile or so that the slack chain had *not* been solely responsible for all the moans of Friday, and miles from anywhere the engine suddenly seized up solid at speed, another motoring fatality being averted by the writer's cautious habit of keeping a finger near the clutch control when driving on rigid transmissions. I draw a veil over my progress to the station; I *ran* the machine thither, as the time-table showed that by catching the first train I could overtake the trial and get a lift on a car. The cross-country route to the station was far more truly Colonial than anything previously encountered, and in one place a small loch had overflowed it for 100 yards to a depth of 6in. or so. Next year I shall report the Scottish Six Days on my own machine. It is false economy to subject a borrowed mount to the gruelling such a week implies, and it is absolutely necessary to have a complete and intimate acquaintance with one's machine.



J. R. Alexander, E. A. Colliver, and E. Frasetti, who formed the winning Indian team in the Scottish Trials, all of them riding the 7-9h.p. models.

Occasional Comments by "IXION"

Broken Spokes.

From all I hear the old nuisance of broken spokes has been a little too common this year, especially on machines produced by firms who have recently adopted chain drive without much experience of the strains which a comparatively rigid drive, in conjunction with a low emergency gear, can throw upon all the fittings from stem to stern. A correspondent tells me he has suffered untold things from this cause during the early summer, as he has to unscrew his chain sprocket before he can insert a new spoke; and on one occasion he was unable to shift the sprocket, even with the aid of his local dealer. He enquires whether there is any objection to the old dodge employed on the B.S.A. pushbicycle of cutting holes in the hub shell flange so shaped that a new spoke could be slipped in without removing the sprocket. I know of none, and hope designers will consider the point. It is quite independent of weak wheels, for a spoke may easily be damaged by accident; and any design which encourages riders to drive with a few spokes damaged or missing is radically bad; it is bound to lead to buckled wheels, whereas the mere replacement of a spoke is a perfectly trifling matter.

Renewing Piston Rings.

Every sensible rider is aware that the "spring" of a piston ring will keep it a sufficiently tight fit in the cylinder bore after thousands of miles have worn much metal off its frictional surface. He is equally aware that wear is not confined to the rubbing surface, but takes place at least as rapidly in an up-and-down direction, as the piston rises and falls, and the ring is thrust forcibly, first against the lower wall of its groove, secondly against the upper wall, most of the wear probably occurring against the lower edge of the groove. This play cannot be taken up automatically, and new rings are requisite at regular periods. A good many makers are too stupid to stock rings a little wider than their original standard, but I am glad to learn that the Triumph Co. are setting a very wise example. They are prepared to supply rings, five, ten, and fifteen-thousandths of an inch wider than standard for replacement purposes, thus saving the fastidious rider the expense of having special replacement rings turned up by a repairer.

The Indian Electric Equipment.

I have just had my first longish night ride on a Hendee Special with the full electric equipment; and as I had not ridden a very recent sample of the 7 h.p., the excellence of the engine absorbed the whole of my admiration for a considerable time; I do not know whether all the 7 h.p. engines are as good as the one I tested, but it was positively delicious—it cooed along like a sucking dove on the pilot jet, and, when the throttle was opened, it instantly transformed itself into a torpedo boat destroyer on its time trials. "Pro-deegious!" as Dominie Sampson used to say. When I grew accustomed to the potency and flexibility of the power unit, I began to turn my attention to the electrical equipment, and came to the conclusion it is a most desirable addition to a heavy mount *de luxe*, especially when loaned one for a short period. We may remain obstinately faithful to acetylene, because we understand it, and can rely on overcoming its most fantastic whimsies, but it is undoubtedly very pleasant to switch on an electric lamp, and that without any anxiety about the batteries, because you know a dynamo is busy replacing the current you are using. I have long had a weakness for the electric hooter, and was very reluctant to decide, as I did, that it is not good enough on a motor cycle unless you have a dynamo. I have a Klaxon on my cycle car, and experience with small 4-volt hooters and batteries on my cycles has led me to put a huge 30 lb. accumulator to run the Klaxon; the Indian, with its engine contantly recuperating the batteries, stands in a very different category. Whether I should have a peaceful time with the Hendee Special if I bought one for keeps is another question. The makers issue a ten-page booklet, the pages of which are mostly filled with the phrase "Let it Alone" in capitals, and as my bump of inquisitiveness is about 100 c.c. bigger than my bump of prudence, I should probably dissect the whole affair in the first week, and borrow an acetylene lamp and a pneumatic hooter to serve my turn till I

Monsieur H. Sipiere, the Judge of the Court of Appeal at Algiers. He is seen mounted on a 6 h.p. Enfield sidecar in front of a Moorish villa.

Occasional Comments.—

got the electric gear together again. The weights are interesting and total 62¾ lb., viz., electric motor, 25¼ lb.; batteries, 14½ lb. each; head light, 2¼ lb.; tail light ½ lb.; hooter, 2 lb.; regulator, 1½ lb.; switchblock, 1 lb.; connecting block, ¼ lb.; wiring, 1¼ lb. These are rather depressing, so far as they reflect on the possibilities of using electricity for similar purposes on light touring machines of 3½-4 h.p. The total can be reduced by more than half by omitting the spare battery and the dynamo; but a battery minus a dynamo would never stand the racket of starting an engine and blowing a hooter; and 62¾ lb. is too formidable an addition with which to burden a medium powered machine. However, the 7 h.p. Indian would not complain if its luxurious kit were twice as heavy.

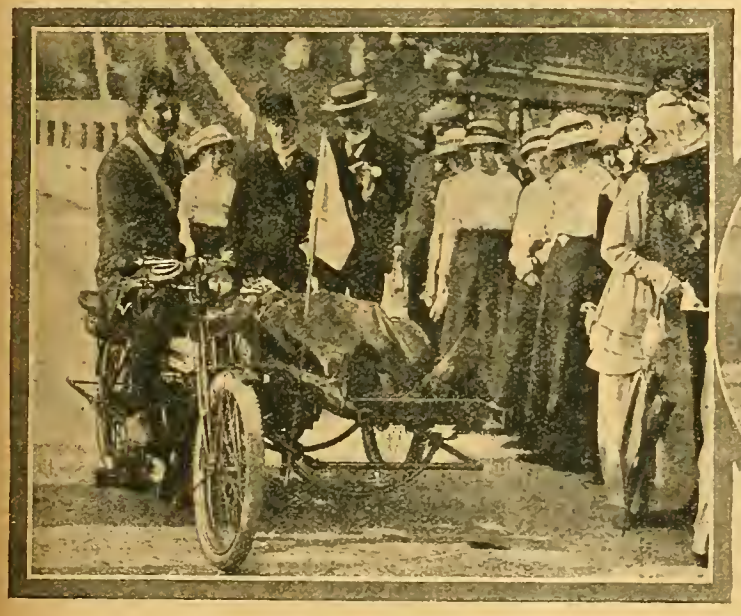
A Tip for Springs on Bad Roads.

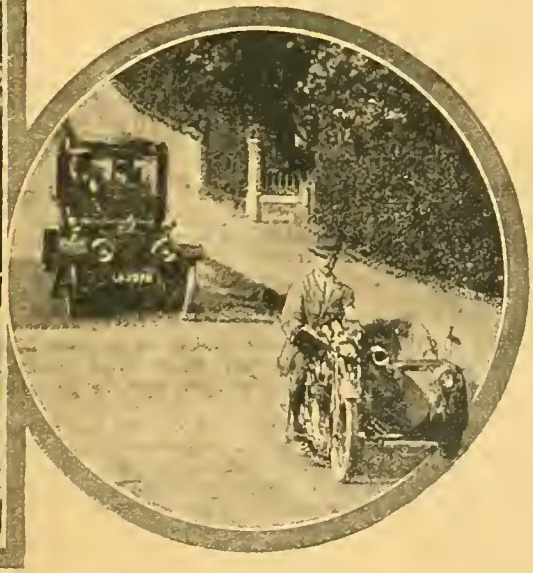
If the springing of your cycle car is a shade too lively on bad roads, and the consequent motion reminds you too keenly of that ocean greyhound the ss. *Fenella* in a choppy sea off Douglas Head, or of the Wiggle-woggle at Earl's Court after too rich a lunch in the sun, try binding the lower halves of the rear springs with trawl twine. We all know what a "corrugated" road is, but there is a worse species still; an actual sample may be inspected between St. Albans and Barnet; my better half describes it as "scolloped," but for the sake of the happy northerner who never has to drive over it I may liken it to hammered copper-work as viewed through an extremely powerful micro-scope. After my last trip to town I decided to leave my cycle car for disposal at a Euston Road slaughter-house, and to return to Coventry by aeroplane. But a kindly garage manager produced about 300 yards of what he was pleased to identify as "trawl twine." We took the back wheels off, and bound the rear springs in a manner reminiscent of repairing a cricket bat. On the return journey the car negotiated the scolloped surface at 15 m.p.h., as against 3 m.p.h. on the south-ward journey; and we only shed three grease cups, as compared with eleven on the outward journey. But beware—it takes more twine than one would fancy; I estimated the quantity required at thirty yards. I believe we bought three hundred, and when we had finished there wasn't quite enough left to bind the entire periphery of a 14in. steering wheel.

Batteries for Electric Hooters.

We live and learn. I have hinted lately that my theoretic enthusiasm for electric hooters had received sundry heavy dampers, and last week I unbosomed myself to an accumulator manufacturer. He waxed very wroth. "Yes!", he exclaimed indignantly, "there are a lot of idiots who are supplying ignition accumulators and small dry cells for the job, and they can never stand the heavy discharges. They will work moderately well, for the first month or two, but after a few rechargings the accumulators will be done for, and the cost of replacing the dry cells at such short intervals will inspire you to give away the hooter if you can find anybody fool enough to take it. I'll make you the right sort of accumulator!"

I waited expectantly, after nominating an eight-volt hooter which adorns my cycle car, and which has been silent for a month or two because it buckled the plates of the original accumulators with sickening regularity, and ate up dry cells with a speed which made its upkeep as heavy as the tyre bill. Finally an enormous package arrived, and I unearthed an accumulator measuring 12in. × 10in. × 5in. and weighing—well, it broke the domestic balance which registers up to 15 lb.! This is an accumulator maker's idea of the kind of cell which is desirable for an eight-volt hooter, when there is no dynamo to keep the cell constantly up to the mark; and his notion suggests that electric alarms are best confined to powerful cars, save where (as on the Indian) a dynamo replenishes the cells faster than the hooter drains them. The accumulator in question is catalogued at 50s.





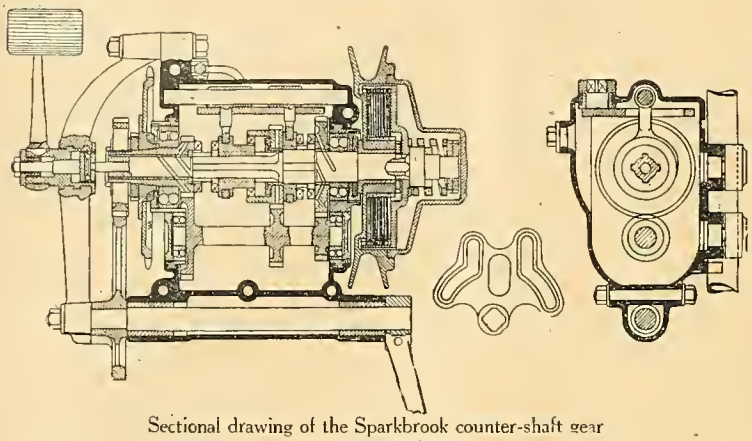
THE RED CROSS FIELD-DAY AT BROOKLANDS

The only motor cycle ambulance—a 3½ h.p. Triumph and Gloria sidecar.

T. W. Loughborough (7 h.p. Matchless sidecar), who escorted T.M. Queen Alexandra and Empress Marie of Russia to Brooklands.

The Sparkbrook Three-speed Gear.

FOR some time past the Sparkbrook Co., of Paynes Lane, Coventry, have been testing a new three-speed counter-shaft gear, which made its first public appearance in the London-Edinburgh run, on which occasion it performed excellently, and, besides giving no trouble, proved itself particularly free from oil leakage. The gear will not be standardised on Sparkbrook models till 1915, but in the meantime it will be produced for the trade as a fitment suitable for new or converted machines. Before examining the interior of the gear box we had a short trial run, and found that the gears ran remarkably silently on all three ratios, and the change of gears can be effected quietly at almost any speed. The control lever is conveniently placed, and in thick traffic one changed gear almost automatically and without the slightest noise or jar

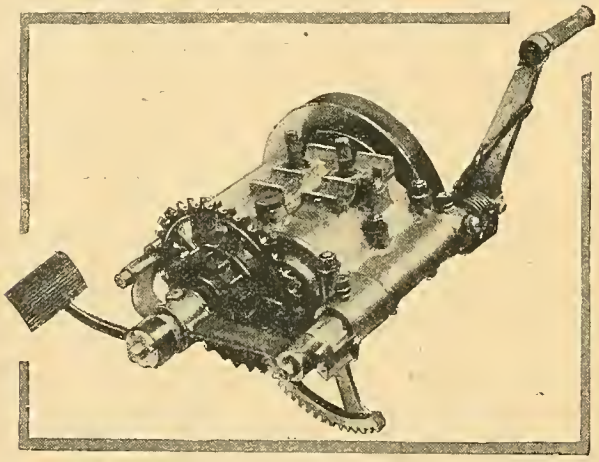


Sectional drawing of the Sparkbrook counter-shaft gear

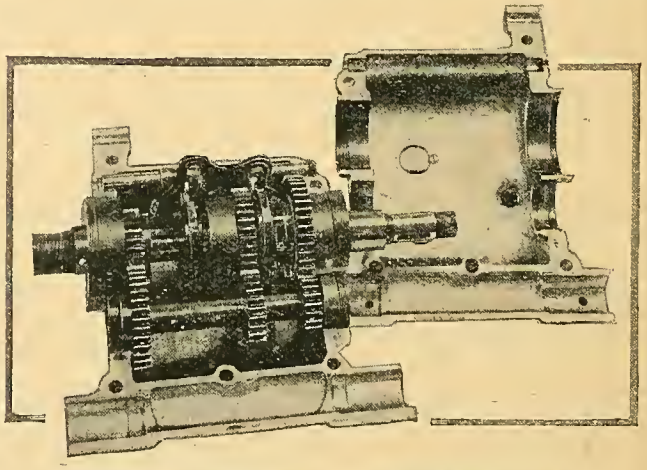
The box is of the constant mesh type, all three pairs of wheels remaining in engagement, and the variations of ratio being obtained by moving two sets of dog clutches. One set of dogs operates the high and middle gears, the latter being of the internal dog type, while the other dog locks the low gear wheel to the shaft. The forks which move the dogs pass through slots in the cam plate, and are free to slide on a plain bar at their butt ends. Thus the rocking of the cam plate causes them to move sideways and engage the gears in proper rotation. The cam plate itself, though particularly simple in form, is a clever piece of work, and it is hard to imagine a simpler actuation for a dog gear.

Sound Method of Housing Bearings.

All the various good features of the Sparkbrook two-speed gear have been retained, and the ball races are mounted in phosphor bronze housings cast with the outer shell, while the screw adjustment for the front chain, of course, remains. The same type of multiplate clutch is employed, the big plates being mounted inside the 8in. belt pulley. The clutch control has been considerably simplified, and now consists of a pedal mounted on a cast thread screw and carried in a cross bar bolted direct to the gear box. The kick starter is integral with the gear box, and to assist easy engagement every other tooth in the starting wheel is removed, a simple device which might come into more prominence. The dogs on the mainshaft slide on splines instead of squares, and the layshaft is solid with its gears.



The complete Sparkbrook gear box, showing kick-starter and gear-operating mechanism.



Showing the internal mechanism of the Sparkbrook three-speed gear box.

THE OLYMPIA SHOW ARRANGEMENTS.

SOME drastic alterations are already in progress in connection with the Olympia Show arrangements in November for business office space and the grouping of the light car exhibits.

Last year nearly the whole of the Annexe was given up to business offices. This year the organisers have decided to erect above all stands which back on to the walls of the building on the ground floor an office which will be reached by a staircase and passage. The latter will extend all round the building, so that visitors to several offices can walk from one to the other without having to descend to the ground floor.

These stands will be uniformly decorated, and each stand will be equipped with the same type and shape of banner and lettering. It will be found that his scheme will add considerably to the general appearance of the Show, whilst providing the necessary extra space for the light car exhibits which is so urgently required.

The whole of the light cars will this year be grouped together in the Annexe, and a price definition has been decided on which will exclude all cars from the motor cycle and light car show which do not conform to it. The definition is as follows:

"Any two-seated automobile, the retail price of which equipped for the road, including hood, screen, lamps, and spare wheel, does not exceed £200."

This will not prevent the organisers, the Manufacturers' Union, from refusing any vehicle which in their opinion is not a light car, as they will have a clause in their agreements to that effect

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Oil Leakage from Engine.

I am in trouble with oil coming from the bearing on the pulley side of my machine. It covers me and the engine on a long run, although the engine is in splendid mechanical condition. There is a little side play, but no up and down play on the shaft on the pulley side. What can I do to stop this nuisance?—E.W.

See that the crank case release is in proper working order, and that there is not any compression set up in the crank case, which would tend to force the oil out of the bearings. This is a very common happening, and can be very easily cured by making sure the release valve is working.

Lining up a Sidecar.

Will you please give me directions for correctly affixing a sidecar to a motor cycle to obtain perfect alignment?—A.S.

First of all place the machine on a level floor, then line up roughly without securing the joints too tightly; get a spirit level, first testing if the motor cycle is vertical, and then the sidecar. To get perfect alignment, get two pieces of wood of equal length, place two chairs back to back—one in front and one behind the machine—lay the pieces of wood on the seats against the back of the chairs and join these up with string, each end of the string being exactly the same distance apart on the pieces of wood. If you stand at the end of the line and look down you will see whether or not the bicycle and sidecar are parallel.

Overheating and Knocking.

My motor cycle engine gets very hot. I have examined the exhaust valve, and find it opens at the bottom of the firing stroke; this, I think, is right. And the spark occurs when the piston is at the top and lever retarded. I hear also a certain amount of knocking when on top gear or when I put on a little extra air, but this does not occur on bottom gear. Can you suggest a cause?—J.R.C.

If the exhaust valve, as you say, opens at the bottom of the firing stroke, it is certainly not correct, and is probably the cause of the overheating. This valve should be timed to open about forty-five degrees or one-seventh of the stroke before bottom dead centre, and close at top dead centre. The ignition timing is quite correct. Most engines are prone to knocking on top gear when labouring—that is, when going slowly on a hill, or when picking up on top gear.

A Trapping Query.

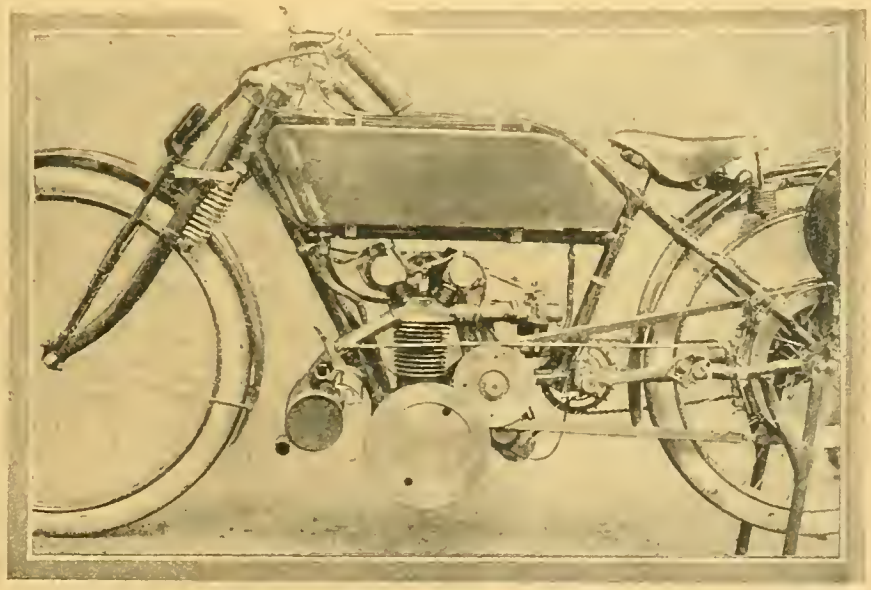
In proceeding through Godalming recently with my motor cycle and sidecar at a pace of about 8 m.p.h. I was stopped by a plain clothes man and told rather brusquely that I should be summoned for racing through the town at 20 m.p.h. I was travelling up hill at the time, and had to turn a most dangerous corner with a nervous lady passenger, which speaks for itself as to my pace. Can the plain clothes constable legally act as he did?—L.C.

There was no necessity for you to stop on the request of a plain clothes policeman. According to the Act of 1905, you need only pull up on the request of a policemen in uniform or the driver of a horse-drawn vehicle. If the man in question was really a policeman and your summons comes through we do not know what you can do, as if the police say they timed you and prove you were doing a speed in excess of 10 m.p.h. you will be convicted. If you are a member of the Auto Cycle Union (83, Pall Mall, S.W.) or the Automobile Association and Motor Union (Fanum House, Whitcombe Street, W.), we should recommend you to get their solicitor to defend you if the case comes into court.

Overhead or Side-by-side Valves.

What are the disadvantages of an overhead valve engine compared with one fitted with side-by-side valves, and would starting be difficult with the overhead type and a fixed gear? Also, is it possible to obtain slow running with a 4 to 1 gear?—T.R.M.

The disadvantage of overhead valves is that their adjustment is liable to become deranged more quickly than that of side-by-side valves; also, in the case of breakages considerable damage may be done to the engine by the head dropping into the cylinder. On the other hand, with an overhead valve engine the valve can be made much larger, and consequently the efficiency of the engine is increased somewhat. Provided the carburetter is in proper adjustment, you should have no difficulty in starting with the overhead type with a fixed engine, and as regards slow running this also depends upon the carburation, and, to some extent, the valve timing. If the engine is timed for fast running you would very probably not be able to throttle down on a 4 to 1 gear to a really slow pace. Generally speaking, overhead valves are right for racing and speed work, and side-by-side valves preferable for touring.



A FRENCH RACER OF WHICH MORE WILL BE HEARD.

Belt side of the four-valve 500 c.c. Peugeot engine on which Pean recently broke the kilometre record in France, his speed being 76.09 m.p.h. As will be seen, the machine is fitted with four overhead valves, two exhaust and two inlet pipes, outside flywheel and combined drive.

Loss of Power on Hills.

My 1912 machine took a good 1,000 miles to get well run in, and the running continued to improve until a slack big end bearing needed attention at 9,000 miles. At this mileage I had the connecting rod rebushed and fitted a new piston and crank pin, and I have now run the machine some 500-600 miles since the rebushing, and the running is not satisfactory. The machine pulls splendidly on the level or on a mild gradient, but on a hill like Titsey (Surrey) the engine will not carry me more than half-way up, and gets very hot. If I allow it to cool thoroughly it will start on the clutch on the gradient and finish well. I use a gear of about 4¾, and some months ago climbed the steeper side of Dartmeet (Devon) on this gear easily. I use benzole, and the plug and magneto contacts and carbon brushes are quite clean, there is no carbon deposit, the timing is correct, and the compression good. The only unfamiliar noise in the engine is when picking up from a slow speed on a stiff gradient; there is then a slight clank, which I am inclined to think comes from the crank pin not being an absolutely tight fit in the big end bush. In short, I am disappointed with the machine on hills, and should be very glad of your advice. In conclusion, which do you consider the least atrocious road from St. Paul's Cathedral to Lewisham, and from Lewisham to Letchworth, Herts.?—B.T.V.

Probably new valve springs would improve the running of the engine enormously. You might also try advancing the ignition. You are pretty sure to get more power from benzole than you are from petrol. Probably the best route from St. Paul's to Lewisham would be to come down to Ludgate Circus, New Bridge Street, Blackfriars Bridge, St. George's Circus, New Kent Road, Old Kent Road, New Cross, Lewisham High Street. To get to Letchworth from Lewisham, we should advise you to take the Woolwich ferry, and then follow the road marked in blue on the R.A.C. Official Map of Recommended Routes Round London (obtainable from these offices, price 1s. 8d. post free). This brings you to Enfield, and after Enfield G.N.R. Station take the first turning on the right, which takes you to Potters Bar. You are then on the Great North Road, which follow through Hatfield, Welwyn, and Hitchin to Letchworth.

Swindon to the Highlands.

Will you kindly give me advice regarding a projected tour from Swindon? I think of having a fortnight away, but do not wish to be riding more than half the time. Never having visited the North at all I thought of Scotland. Is this a good idea for a summer holiday, or would North Wales and the Lake District be preferable? If Scotland, would the main London to Edinburgh give the best scenery and pass the nicest towns *en route?* Also, what parts in Scotland ought I to visit, taking Edinburgh as the centre?—A.L.M.

It is a good idea to go to Scotland for a summer holiday. What we should recommend you to do is to take the Great North Road right away from London, to a point two miles south of Wetherby, and then turn left and go through Harewood, Otley, Ilkley, Skipton, Settle, Ingleton, Kirkby Lonsdale to Kendal. If your machine is a good hill-climber go on to Windermere and Ambleside, go over Kirkstone Pass along Ullswater, and then to Penrith. Continue to Carlisle and then proceed through Langholm, Teviothead, Hawick, Selkirk, Galashiels, Stow, to Edinburgh, which, however, is a bad town for motor cycling. It is all cobbles and tramlines, and the traffic is badly regulated. It is a fine city, and well worth visiting. Once at Edinburgh you can take the ferry from Granton to Burntisland, and make your way up to the Highlands. After this you have magnificent country at your disposal.

Removing Carbon without Taking off Cylinder.

I wish to clean internal combustion engines without dismantling them, so can you kindly tell me the best process to use?—R.C.P.

Many engines can be cleaned out with the aid of scrapers. Set the piston at the top of the stroke, so that both valves are closed, and use the scrapers sold by the big accessory firms, or make some of your own. We are using a pair which we made of round iron, flat at the end and bent over and ground to chisel face. They can then be bent to suit the necessary angle. One takes the piston and the other takes the combustion head. With their aid an engine can be cleaned out comfortably without dismantling. The carbon dust is blown out afterwards with the aid of a tyre pump fitted with a special narrow connection of flexible tubing with a pointed brass nozzle. If you use oxygen, it is only necessary to buy a cylinder, a reducing valve, and a small nozzle. The best way to start the carbon burning is, after having turned off the petrol and emptied the float chamber of the carburetter, to insert a lighted taper into the combustion head and then turn on your oxygen. The carbon will then catch fire and burn in a shower of sparks until it has all disappeared. The nozzle should be kept moving about, so that the carbon from all parts may be consumed, when the flame will immediately cease.

"Ixion" will reply to "H.W." (Beds.) if he complies with our rules by sending a stamped addressed envelope."

EXPERIENCES WANTED

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"A.L.G." (Wimbledon).—Stelastic tyres for rear wheels.

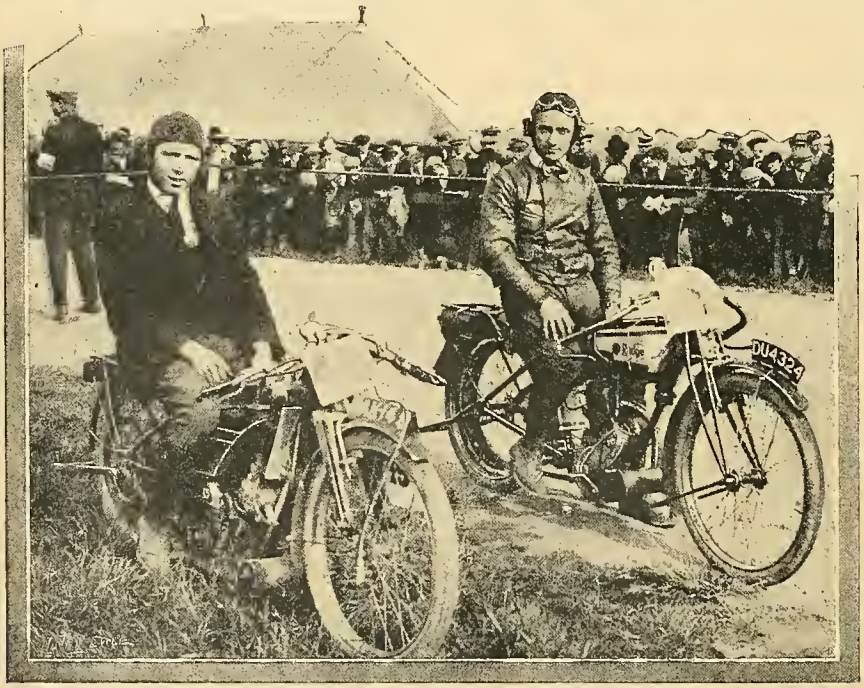
"W.Z." (Loughton).—Henderson with sidecar. Reliability, hill-climbing, easy starting, brake power, carburetter, clutch, two-speed gear, etc.

"E.C.W." (Sutton-in-Ashfield).—Whittle belt on 5-6 Rudge-Multi.

"J.D." (Tidworth).—New Imperial-Jap "Light Tourist"—2½ h.p., 293 c.c. Reliability, fuel consumption, hill-climbing, etc.

"B.E.S." (Berks.).—Douglas, Connaught, or other machine suitable for ladies' use. Kick-starter preferred.

"D.T." (Rugby). Experiences with Triumph and Clyno two-strokes. Maximum speeds, petrol consumption, and if small road wheels cause vibration.



THE T.T. WINNERS OF 1913 AND 1914 SNAPPED TOGETHER AT THE DONCASTER TRIALS.

H. O. Wood (3¾ h.p. Scott), 1913. C. G. Pullin (3½ h.p. Rudge), 1914.

MILITARY MOTOR CYCLING NOTES.

Recent Military Operations in which Motor Cyclists were Concerned.

EARLY this month a "Staff Exercise" was held in which a number of Special Reserve motor cyclists and civilian motor cyclists took part. The general "idea" was: At the end of May an oversea power (Blue) seized Southampton and commenced disembarking troops. All the available British troops were concentrating at Godalming (cheerful for military motorists).

On June 3rd information was sent to 1st Army headquarters at Thursley to the effect that the 3rd Division had been intercepted and was heavily engaged in the neighbourhood of Stockbridge. Consequently, relief had to be sent as soon as possible. Further information to the effect that the enemy had only landed three divisions, but had advanced to the neighbourhood of Winchester, was received.

The first Army was composed of a cavalry brigade and a division with a portion of a second division. The Army was completely mobilised and was billeted on the Elstead-Shottermill road.

Further military details would not interest the lay reader. On these operations the signal units with their attendant motor cyclist despatch riders were well represented. Of other troops there were comparatively few. This at first may seem curious. A division, however, was represented by several motor cars carrying various officers and their A.D.C.'s. The writer first had a *rendezvous* on the famous Hog's Back, where several civilian motor cyclists had assembled. The machines were Blackburnes, Triumphs, and P. and M., the latter the writer's mount. The motor cyclists then moved to Kingsley, where Army headquarters were situated. Upon arrival at Kingsley a large number of motor cyclist Special Reservists were found. These men were doing their annual fifteen days' training with their signal units. The machines found here were Bradburys and Ariels.

THE MOTOR CYCLE AND THE ARMY.

(1) Members of the Cambridge University O.T.C. (motor cycle section) passing the saluting base during the recent inspection by Major-General Davies, C.B.

(2) The motor cycle section of the East Lancs. Divisional Signal Service, in camp at Carnarvon

(3) Scouts attached to the Royal Gloucestershire Hussars in training at Brighton.

The first orders received were for some motor cyclists to be despatched to the various signal (telegraph) offices attached to the divisions and cavalry. The writer then received orders to join the cavalry at Froxfield and take charge of the motor cyclists at that spot. Upon arrival at Froxfield it was found that the cavalry had moved and left no sign. After having covered some twenty miles, stopping to enquire at almost every village if a military motor car had passed that way, eventually the cavalry signal office was found at a cross roads, the cavalry headquarters being some nine miles distant. As cavalry are extremely mobile, it is next to impossible to lay telegraph wires at sufficient speed to keep up with them. Thanks to Mr. Marconi, a cavalry signal station consists of a wireless troop. Upon the writer's arrival a Blackburne rider (C. Q. Roberts) had just returned from Portsmouth, having averaged 42 m.p.h. both journeys. The cause of his journey is interesting. There are in the Army many wireless telegraph motor sets. These "offices," as they are called, have for motive power 5 h.p. Douglas engines. Owing to a rush of work it had been necessary to run one set at an extremely high number of revolutions for well over half an hour. It must be remembered

Military Motor Cycling Notes.—

that there is no cooling rush of air as on a motor cycle, the only method of cooling being vanes on the flywheel. Excellent as these little engines are, even a Douglas cannot stand such continued hard treatment. A small but important detail broke, hence the motor cyclist's journey.

Had no motor cyclist been available an entire wireless telegraph would have been rendered useless. While on the subject of wireless telegraphs, it is interesting to note that all sets have for motive power motor cycle type engines. The smaller sets are run by Douglas engines and the 8 h.p. sets by the 8 h.p. J.A.P. (water-cooled). As has been mentioned, cavalry headquarters were situated some nine miles from the signal office, the whole distance being almost entirely a gradual climb. Motor cyclists covered the distance with ease in an extremely short space of time and were a great relief to the tired soldiers riding pedal cycles.

Later in the day the writer returned to headquarters, two other motor cyclists being sent out to the cavalry for the night. About 11 p.m. "operation orders" were sent out. For this purpose motor cyclists were used. These orders have always to be sent by wire and also by despatch riders. Thanks to good lamps and the perfection of the motor cycle, a few motor cyclists performed duties in a very short space of time that in former years had taken many hours.

Fighting re-commenced at daybreak and continued until noon, when the umpires stopped further operations.

A Good Time and Hard Work.

The writer, when discussing matters afterwards, discovered many interesting details. A Blackburne rider had covered over 250 miles—the average mileage seems to have been about 180 to 200 miles. The above-mentioned machines seem to have unlimited power, and their silent running was much commented upon. The writer's P. and M. ran faultlessly and climbed the many long gradients abounding in the district with ease with plenty of power in hand. The rate of pay was 12s. for twenty-four hours and an allowance of 1s. per hour for further time, with the usual travelling allowance (civilian rates). All motor cyclists engaged agreed that they had thoroughly enjoyed themselves, and wanted to know the next occasion on which they could turn out.

There is no doubt whatever that if only more motor cyclists would take the trouble to enquire into the conditions obtaining in the life and work of a despatch rider to the Army, there would be a great rush of riders anxious to take part in this most interesting and novel work.

R.E.S.R.

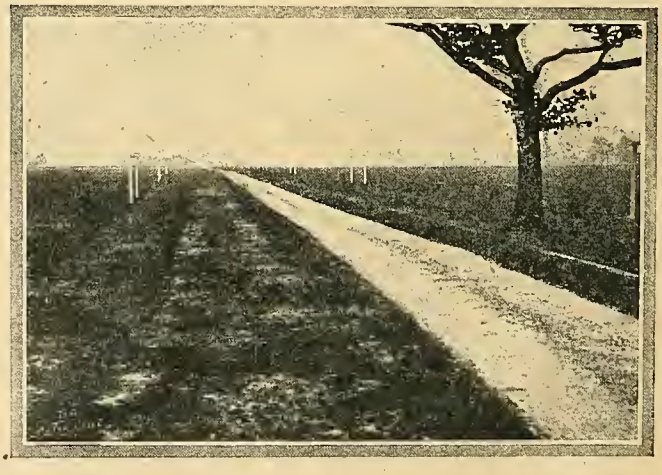
A Wet Afternoon in My Garage.

By ROAD RIDER.

I HAD planned a long trip on the newest motor bicycle for my last leisure afternoon, but a terrible deluge and the lack of a riding companion made me play the coward, and I spent the time in my cycle shed, called by courtesy a "garage," as it makes a better headline. By teatime I was very glad it had rained. I sauntered in, looking for some odd job on which to while away an hour or two, and my eye fell on an ancient T.T. Douglas in the corner. I remembered that last time out it had been afflicted with a misfire, apparently due to the ignition, which I had failed to cure. Having my doubts of the spare plug, I inserted a brand new E.I.C. and a cure followed. Idle fingers then proceeded to tie the "dud" plug on to the inlet pipe, couple it up to the magneto, and start the engine on one cylinder to see how the peccant plug behaved. Its spark was certainly not "bushy"—to quote a delicious term from a recent circular, and at intervals the spark occurred high up inside the plug body instead of across the business end. The little Douglas started so readily on one cylinder, the merest flip of one hand on the back wheel sufficing, when the plug was removed from the idle cylinder, that I bethought me of a large box containing about twenty assorted sparking plugs, the relics of four or five seasons.

One after another I tested them all as described on the Douglas, and so sorted out the invalids from those which deserve a fresh lease of life. I never learnt so much about plugs in my life. The spark varied from the minus quantity to a wee flicker across the points, and from internal illuminations of the cup-shaped hollow in the plug-end to a huge "treesome" conflagration resembling a small explosion across the electrodes: "treesome" is better than "bushy," don't you think? In future I shall make periodic tests of all my plugs on the Douglas. It is worth its oats purely and simply as a plug tester, for there is no engine on the road which starts so readily with a cylinder idle as the small capacity horizontal twin. What Mr. Douglas would say if he could have heard me running that engine free on the stand at intervals throughout a long wet afternoon, I daren't think!

["Treesome" is certainly good. It reminds us of a certain artless bandar, which danced upon a pine, and was described by Mr. Rudyard Kipling as "a gleesome, fleasome thou."—ED.]



The road through the Castle Bromwich playing fields, over which the Birmingham M.C.C. held their Speed Trials on Saturday last.

B.S.A's and Sidecars - - FIRST and SECOND.

Press comments on the B.S.A. performance in the Senior T.T. Race:

"MOTOR CYCLING"

"The regularity of the B.S.A. was quite a feature of the Senior T.T."

"DAILY NEWS & LEADER"

"The B.S A. set up a remarkable record of dependable regularity, combined with high speed, when no less than six of them finished the course without trouble. This was one of the outstanding features of a great race."

The outstanding feat in the many open competitions in which B.S.A. machines have been so extraordinarily successful, is that they have often beaten machines of considerably higher power. The constant successes of B.S.A. sidecar combinations afford striking evidence of the great power and reliability of B.S.A. Motor Bicycles.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Four-speed Morgans.

Sir,—In your description of the Morgans entered for the Scottish trial, you doubt if the four-speed gear will ever be standardised. As a matter of fact, it has been standardised for two years and appears in all our catalogues. It has met with a fair sale—the cars running in the Scottish were, with one exception, entered by purchasers and not by the firm. They have been used frequently in other competitions.

MORGAN MOTOR CO., LTD.

Miniature Motor Cycles.

Sir,—Does it not seem a mistake that all miniature motor cycle trials held or contemplated up to date have their limit at 200 c.c.?

I have just glanced through a few advertisements and *The Motor Cycle* list of 1914 machines (published last November), and I have found that there are about thirteen machines with their capacity from 200-250 c.c., and ten machines with their capacity under 200 c.c. (not counting auxiliary motors).

I must apologise if I have left out any machines in my calculations, as I daresay I have. Anyhow, could not this be remedied by making the limit 250 c.c.?

C.

Adjusting the Carburetter to the Seasons.

Sir,—The point raised by "Ixion" in a recent issue regarding the adjustment of the carburetter to the seasons is one of exceptional interest, and one that has not hitherto received anything approaching the consideration it deserves. The amount of adjustment and how frequent it is necessary depends largely upon the manner in which the carburetter is fitted, and by proper fitting it is possible to reduce the necessity of adjustment to a minimum. Adjustment is, however, a necessity on account of the varying grades of fuel encountered when on tour (especially abroad), in addition to climatic changes, but a modern carburetter should be designed to permit of instant and simple adjustment throughout a wide range without it being necessary to change the jets or choke tubes, which operation not only involves a certain amount of experimenting to obtain the best combination, but also the carrying of a number of somewhat delicate spare parts, while if the carburetter is designed to permit of easily varying the strength of the mixture, adjustment can be effected whilst running, and the correct setting more readily ascertained. In *The Motor Cycle* report of the London-Edinburgh run mention was made of carburetters freezing up, and this in June. What would happen to the same machine if entered in the Grenoble trials may be imagined; it would certainly be unable to climb even the lesser passes of the Alps without constant stops for thawing. The manner in which carburetters are fitted (attached would be more correct) to some twin-cylinder machines is simply asking for trouble in anything but summer weather. Care in the fitting not only results in far greater pleasure in driving and less adjustment, but also great economy, which, with petrol at its present price, is a big consideration. I mention that a certain well-known 6 h.p. machine with coachbuilt sidecar with hood and screen, and 9 st. 6 lb. passenger, luggage, etc., did eighty-six miles per gallon on a recent club reliability trial across North Wales, the same machine incidentally obtaining the first prize for regularity. The obtaining of the above consumption was not by the sacrifice of power, for, geared 4⅜ to 1, the machine could easily account for all main road hills on top. I hope that the foregoing will assist in stimulating additional interest in what is undoubtedly a most important subject.

ERNEST P. EVEREST.

A Lightweight Tourist Trophy Race.

Sir,—Referring to correspondence *re* Lightweight T.T. proposed by you. I do not find it possible to agree with Jack Spratt. It surely cannot be contended that the miniature four-stroke is eminently unsuitable for the tourist, its reliability having been conclusively proved by the recent performances of such small four-strokes as the O.K.-Junior and Calthorpe-Junior.

The effect of the exclusion of such machines would be to deprive the public of an opportunity of seeing the machine put to a strenuous test, and also to rob the makers of the benefit gained by their experience in the race.

If Jack Spratt maintains that a T.T. race in which four-strokes were admitted would produce freak engines, would not a race for two-strokes only equally produce freak engines?

UNCLE.

Sir,—I must say, in fairness to both riders and makers of the four-stroke lightweight of 200 c.c. and under, that I think it is very unfair of Jack Spratt to suggest a T.T. race for two-stroke machines only, and also of "L.E.L." to want the limit raised to 250 c.c.

I agree with the Calthorpe Motor Cycle Co. in every respect; an efficient engine of 200 c.c. with a two or three-speed gear is quite capable of performing everything the average lightweight user requires. Personally, I find my single-speed 2 h.p. Humber all that could be desired from an engine of its size.

B. BATE.

Sir,—I was delighted to read your suggestion in offering a trophy for a lightweight T.T race.

Like many other prospective riders, my hopes were raised considerably, and I shall look forward to the result with pleasurable anticipation, for such a test as you propose will result in a great demand for a lightweight which has proved its efficiency against all comers.

I had been waiting for a cheap mount, and that appears to have made its advent, but its capability was the doubtful factor.

I quite agree with two of your correspondents on two important points. One is that the machines should be of

THE LIGHTWEIGHT TRIAL FOR THE CALTHORPE TROPHY.
E. Gutzemann (Velocette) and C. Aslen (Grandex) passing the observer—Mr. E. Lycett—on the steepest portion of Sunrising.

the two-stroke type; the other, that the capacity should not exceed 200 c.c.

It is true this may exclude some types of machines already of the lightweight order but over 200 c.c., but surely it will give these manufacturers an opportunity for further experiment, and the notice is quite sufficient for them to make the necessary change before the event.

I think, too, the question of price is an important one; in fact, in my humble opinion, the race would be more interesting if a limit could be placed on the cost, as no doubt cheap and, I hope, efficient lightweight motor cycles have come to stay, and to attract many whose purses cannot extend to expensive mounts. R. J. P. CAMPBELL.

Sir,—There is no doubt that there is a market for a light, cheap, small-powered motor cycle which is also cheap to run, and a Tourist Trophy race should be a great help in developing such a machine. In my opinion, then, there should be a limit placed upon each of the four points mentioned, and, for the sake of example, I would suggest the following:

1. Weight, 120 lb.
2. Price, £35.
3. Capacity, 250 c.c.
4. One gallon of petrol to be allowed for a race over four laps of the T.T. course (150 miles).

I do not agree that the race should be confined, as Jack Spratt suggests, to two-stroke engines only, for I would encourage every type, provided it can conform to the four points which I consider desirable; nor do I think that the limit capacity should, at present, be placed so low as 200 c.c., but in this connection I would point out that the suggested petrol allowance will restrict the size to some extent, and it may be found that two-stroke engines cannot exceed 210 c.c. or thereabouts, though a four-stroke should have no difficulty in accomplishing the required m.p.g.

JOHN BONYTHON.

Sir,—As I am a regular reader of your valued paper and follow the correspondence columns with interest, could you spare me a few lines?

Firstly, I cannot agree with the suggestion of your correspondent, Mr. Jack Spratt, to limit the new lightweight T.T. race to two-strokes, as it would provide a very valuable comparison between the two types.

I must say I heartily endorse the suggestion made by the Veloce Company to limit weight only, as those manufacturers who dared to enter a big engine in a very light frame would find that nuts have a habit of loosening and mudguards coming adrift in a prolonged race over such a course as that in the Isle of Man. In my opinion price should not enter into consideration at all. J. HAYNES.

Sir,—In regard to letters appearing in your paper on this subject, we should like to express our opinion as possible entrants. We think that the size of engines should be limited to anything under 250 c.c., as this will allow practically all makes to enter, but we think there should be a limit to the price of machines, and that £35 retail would be fair. We contend that if there is no price limit, machines only costing £28 will have to compete with machines costing as much as £42, which seems most unfair.

Also, we think all two-stroke machines should be run and classed together, and that four-stroke types should be classed separately, for the simple reason that it is admitted that a four-stroke engine can be *faked*, whereas a two-stroke cannot. By faked we mean that the four-stroke engine, "just for the race," might be fitted with overhead valves, special cams, drilled pistons, etc., whereas when once two-stroke ports have been cut there can be no alterations made; so that, supposing a four-stroke engine won, it would probably be quite a different type of engine from standard, and thereby prove nothing to the general public, and at the same time give the public the impression that a four-stroke engine was superior to the two-stroke.

We also suggest that not more than three machines may be entered by one manufacturer, thereby giving the small firms an equal chance with larger firms.

PORTWAY-COOPER MFG. CO.
F. K. PORTWAY.

100,000 Passengers.

Sir,—The accompanying photograph may be of interest as showing yet another use for the ubiquitous sidecar.

I run an out-apiary situated five miles from my residence, and it is occasionally necessary to move some of the bees. Formerly, this operation used to give me considerable trouble, as the frames of comb had to be secured against breakage by jolting when the hives were transported by cart. Last

Carrying bees by motor cycle.

year, however, I bought a spring frame Montgomery sidecar, and by taking off the body and C springs I can substitute a light wooden platform, as shown. With such an arrangement no special precautions are necessary, and the combs, etc., can be moved at the legal limit with perfect safety.

Surely this is a record in passenger carrying—100,000 up.

JOHN WARNOCK.

Where does the Lightweight Score?

Sir,—Referring again to the question of weight and cylinder capacity, I give below particulars of three machines which competed in the Senior and the two fastest in the Junior T.T.:

	No. of cyls.	Bore and stroke.	Weight. lb.	Speed. m.p.h.
SENIORS—				
3½ h.p. Motosacoche	2	64×77	207	45.6
3½ h.p. Motosacoche	2	64×77	202	44.7
3½ h.p. Triumph	1	85×88	204	44.6
JUNIORS—				
2¾ h.p. A.J.S.	1	74×81	201	45.6
2¾ h.p. A.J.S.	1	74×81	212	44.7

The heavyweights finished 10th, 15th, and 16th in the Senior T.T. The lightweights took first and second places in the Junior T.T., and may therefore be taken as the type which is produced by such a race.

But in what way does the "lightweight" score for ordinary use? It will be seen that the three "heavyweights" are actually lighter than the second "lightweight," and only 1 lb. to 6 lb. heavier than the other. The speeds are practically identical, but in the case of the heavyweight were taken over a longer course. According to the published accounts, the lightweights used more petrol, while the engines would no doubt "rev." faster. In fact, for a given power the revolutions of an engine vary approximately inversely as the cylinder capacity. That is to say, the "revs." of the heavyweight could be about threequarters those of the lightweight. As the pressures on the bearings are principally due to the inertia stresses, which go up as the square of the "revs.," this means that the bearing

pressures on the lightweight would be about one and a half times those of the heavyweight, which either means a heavier crankshaft, etc., or much greater wear. The same applies to the effect of vibration on the frame.

Taking these machines as typical examples, where does the lightweight score? F. STRICKLAND.

Scottish Trials.

Sir,—Permit me to point out two mistakes in your otherwise excellent account of the Scottish trials as contained in your issue of June 25th. First, your representative states that No. 74 is down in the official programme as H. Berwick. This is inaccurate. A. Newell is the name opposite 74. Your reporter got a private hill-climbing list, the names in which were taken from a proof, and he has apparently confused a private list with an official programme.

Second, the watch at Applecross was not five minutes fast, but was accurate to within half a minute of the official starters' time, and in this respect was similar to all the other checkers' watches. I mention these two facts, as they seem to have been overlooked by your apparently otherwise lynx-eyed reporter.

I should also be glad to take this opportunity of thanking those numerous assistants, whom I was unable to thank personally, who were good enough to come forward in large numbers, and whose assistance enabled the trial to be brought to a successful issue. CAMPBELL McGREGOR.

Secretary, Edinburgh and District M.C.C.

Obstructing the Highway.

Sir,—In the hope that this letter may be read by the driver of the motor cycle and sidecar who nearly caused a nasty spill on Sunday week near Kirkham, may I ask the favour of a little of your space?

Position, 1½ or 2 miles on the Preston side of Kirkham; time, 6.30 p.m.; motor cycle and sidecar with front towards Kirkham; condition of road good, but rather wet, as there had been heavy rain for several hours earlier in the day; roadway on curve, and gradient rising towards Kirkham.

The sidecar was pulled up whilst some adjustment was being made in the *middle* of the road. Owing to the curvature of the road travellers in either direction could not see the obstruction until close upon it. I was travelling from Kirkham to Preston and came upon the sidecar at the same moment that two cars, one behind the other, were passing the stationary sidecar. The least error on the part of one of the three drivers would have caused a serious accident.

Surely if a motor cyclist, sidecarist, or motor car driver wishes to pull up it is incumbent on him to pull well into the side of the road and leave as much room as possible for both lines of traffic. To avoid a spill I had to go so much to the left, almost into the bank and on to soft ground, as to endanger my own safety. Perhaps the motor cyclist will know better in future. E.N.

An Overseas Specification.

Sir,—I take advantage of the invitation in your paper to submit specifications of machines suitable for local conditions. The machines naturally fall into two classes—heavy solo and sidecar machines and light solo ones.

My ideas of a heavy machine for this country are as follow: Four-stroke, twin-cylinder, air-cooled, overhead inlet engine, long stroke (say 80×100 mm., with cubic capacity 1,000 c.c. or so). Cylinders to be both vertical, one behind the other, outside flywheel, clutch and shaft drive, with two or three (sliding gear) speeds, ball bearings, and forced lubrication to bearings. (Practically as in the 1914 design F.N. 7 h.p. engines, but with only two cylinders.) Frame to be sprung back and front with leaf springs, and lined. Large tank capacity, band brakes, 28in. wheels, 3in. tyres, light car rims, automatic carburetter, handle starting, waterproof magneto, twist grip control, long folding footboards, dropped seat, front and rear stands, toolkit on tanks, and with a road clearance of at least 6in.

For a lightweight machine, the new A.B.C. machine recently described in your paper seems to fill the bill, if same proves sturdy and reliable. The Douglas lightweight two-speed also is an excellent machine for local use.

Speaking generally as one who has driven motor cars and cycles and buggies in this country, it astonishes me that the use of the shaft drive as a means of transmission for motor cycles is not more common, since with care such a drive hardly ever gives trouble during the whole period of usefulness of a motor, and in this country (where repair shops are perhaps more than a hundred miles apart) the reliability of the shaft drive, together with the even running of a machine built on the lines suggested above, would amply repay a little extra cost.

Another point required in colonial machines is that the forks (both front and rear) require extra width, and should allow a clearance between the inflated tyre and the mudguard of from 2in. to 3in., with 1½in. between the inflated tyre and the fork on either side. With the narrow clearance given by imported machines, I have often been compelled to abandon my machine, when caught in a shower of rain on an unmade road where the soil is sticky, on account of the wheels gluing up, and in such cases nothing short of a spring cart will shift the machine. I look forward keenly every week to the arrival of your paper, and wish the same every success. E. GUINNESS.

Wycheproof, Victoria, Australia

The Overseas Lightweight.

Sir,—I feel I must take exception to "Ixion's" remarks under the above heading in last week's issue. I succeeded in taking a genuine lightweight over fifteen miles of trackless Dartmoor. The machine weighed somewhere in the neighbourhood of 130 lb., and was 198 c.c. I fancy the course was as rough as bush tracks, veldt, etc., and the machine was perfect at the end of it. I am prepared to do it again, and "Ixion" can watch if he likes. JED MOYSEY.

The Necessity for Universal Rear Lights.

Sir,—Perhaps you will have noticed a report in the daily press of the death of a Derby motor cyclist owing to overtaking and colliding with a brewer's dray.

It was shown at the inquest that the lamp on the dray showing a front light was constructed so as to show a red light at the rear, but in this instance the light was invisible from behind owing to the manner in which the casks had been loaded on the dray. It was also mentioned at the inquest that this class of vehicle was under no obligation by law to show a rear red light. The jury, in giving their verdict, added a rider to the effect that all classes of vehicles on the road at night should be compelled to show a rear red light.

On the top of this, the local centre of the National Cyclists' Union passed at their last meeting a resolution that the time had arrived when all vehicles, including cyclists, should show a rear red light.

Now, this is very important, and is really getting on some, as in all the agitations over the rear light question the N.C.U. and the C.T.C. have been the most active opponents against the rear light being made compulsory for all classes of vehicles. Now is the time for the R.A.C. or A.A. to make amends for their inactivity in the past, and bring the matter forcibly before the Home Office authorities at a time when their attention must necessarily have already been drawn to it by the above mentioned verdict.

I might add that a similar accident occurred a few nights ago with an unlighted-at-the-rear-furniture van, the poor victim being at the time of writing still unconscious, whilst it does not seem long ago since Bailey, of Leicester, met his death in the same manner.

The recasting of the whole Motor Act is recognised as being really necessary, but, somehow, urgent necessity never seems to strike the present day Parliamentary philanderer.

A. B. BENNETT.

SUMMARY OF CORRESPONDENCE.

We have received from two of our readers appreciations of the work done by the Calne Automobile Co. during the night. This information may be useful to others passing through Calne.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

An Open Hill-climb in the West.

Sporting Event on Weston Lane, held by the Bristol B. & M.C.

WESTON Lane, near Bath, was the venue for the Bristol Bicycle and Motor Club's annual hill-climb on Saturday last, and a perfect day favoured the event.

The hill starts with a gentle slope, which gets gradually steeper till about halfway, when it eases slightly, then steepens again, and after an easy S bend reaches its maximum gradient of 1 in 4¾ for a short hump, the length of the timed section being almost seven-eighths of a mile.

The field at the bottom of the hill, which was used for parking the machines and for weighing-in, presented a busy spectacle before the start, for the club officials took their duties seriously, and it appeared that nothing was to be left to chance. Professor Archibald Sharp represented the A.C.U., and Mr. Alec Ross officiated as starter. The timing was done by synchronised watches. The formula $\frac{C \times T_2}{W}$ (as recommended by *The Motor Cycle*) was employed.

At 2.30, the first class, for miniature motor cycles, was started. Unfortunately, there was but a poor entry, and only two actually started. This was the more surprising as machines up to 275 c.c. were accepted, thus letting in a very large number of makes. Of the two, though F. White (2½ Premier) passed our position much faster, E. W. K. Proctor (2¼ Levis) was credited with the best ascent by quite a considerable margain. Results :

	Time. m. s.	Fig. of merit.	Form. pos.
E. W. K. Proctor (2¼ Levis)..	1 11⅗	3877	1
F. White (2½ Premier)	2 6⅘	1438	2

The machines were sent up at short intervals, and in the first few classes there was no delay between the events, so that spectators were kept fully interested. As usual, the excellent plan originated by the Bristol B. and M.C. of sending a marshal up the hill between each class, bearing a notice to the effect that the class was over, was again adopted. Before each fresh class the same marshal descended the hill with a placard on his back stating which class was to be run off next.

Class III., for motor cycles between 275 c.c. and 350 c.c. (expert and general), produced six starters, of whom F. G. Ball, W. W. Douglas, and F. G. Hinton, on 2¾ Douglas machines, and S. Brickinshaw (3 Enfield) all came up very fast and left much room for speculation as to results. G. B. Fry (2¾ A.J.S.) came up well, but K. C. Wright (2¾ Connaught), though very steady, was hardly fast enough. Results :

W. W. Douglas (2¾ Douglas).. 1 7	4594	
F. G. Ball (2¾ Douglas).. ... 1 7⅘	5338	
S. Brickinshaw (3 Enfield).... 1 13⅘		

The entry for Class IV. was the same as for Class III. with the exception of F. G. Ball, who could not ride as experts were barred. Douglas lost a few seconds, and Brickinshaw improved his previous time, with the result that the pair tied for fastest time. Results :

W. W. Douglas (2¾ Douglas).. 1 9⅘	4986	1
S. Brickinshaw (3 Enfield).... 1 9⅘	5198	2
F. G. Hinton (2¾ Douglas) ... 1 26⅘		

Class V.—Motor cycles between 350 c.c. and 500 c.c. (general and expert). In this class the times began to improve, and W. Thornhill on a T.T. overhead valve 3½ Douglas came up very fast, being the first to cover the course in less than a minute. P. H. A. Matthews, though he rode beautifully, was not fast enough, probably owing to the fact that his machine had a new piston fitted. This was a disappointment, as he can generally be relied on to put up a fine performance. F. W. Carryer's Royal Ruby appeared overgeared for the hill, but F. P. Davies, G. H. Fry, G. H. Tucker, and H. Rhodes, all mounted on Rudges, came up fast. Results :

W. Thornhill (3½ Douglas)	57⅗ s.	5189	1
G. H. Fry (3½ Rudge)	64⅕ s.		
F. P. Davies (3½ Rudge)	65⅗ s.	5592	2

Class VI. was the same as Class V., but expert barred, and produced much the same results, though Carryer improved his time and came into third place. Results :

W. Thornhill (3½ Douglas)	59	5445	2
F. P. Davies (3½ Rudge)	64⅘	5389	1
F. W. Carryer (3½ New Imperial)	68⅘		

As will be seen from the figures of merit, Davies succeeded in beating Thornhill on formula.

There were but three starters in Class VII. for machines between 500 c.c. and 750 c.c., of whom A. B. Wade (6 Zenith) was perceptibly the fastest, though he was somewhat baulked at the finish by some cattle. H. A. Pritchard (4 B.S.A.) came up very well, but cut out too much and was rather unsteady near the top. G. E. Powell (4 Triumph) made a good, steady ascent, but his pace was not enough. Results :

A. B. Wade (6 Zenith)	57½	6085	2
H. A. Pritchard (4 B.S.A.)	64	5864	1
G. E. Powell (4 Triumph)	78		

Class IX. (unlimited, expert and general) was noticeable for the fact that none of the fastest men were placed on formula. Matthews rode Fry's Rudge and put up his best performance. Wade was again very fast, and Carryer, Thornhill, and Brickinshaw all came up well. G. H. Fry, on an 8 Zenith painted white, came very fast, but was stopped by a marshal's red flag and returned to make another good ascent. Thornhill was rather badly baulked by a competitor whom he overtook. Results :

A. B. Wade (6 Zenith)	55⅘
W. Thornhill (3½ Douglas)	57⅘
G. H. Fry (8 Zenith)	61⅘
On Formula.	
P. H. A. Matthews (3½ Rudge)	4671
S. Brickinshaw (3 Enfield)	4704

Class X. (same as Class IX., but expert barred). Carryer, F. B. Davies, Thornhill, Rhodes, and Brickinshaw all came up very well. G. B. Fry's (2¾ A.J.S.) had improved, and Proctor's Levis made a wonderful ascent for its size. F. C. Wasley (8 Zenith) was a non-starter, as his engine seized just beforehand.

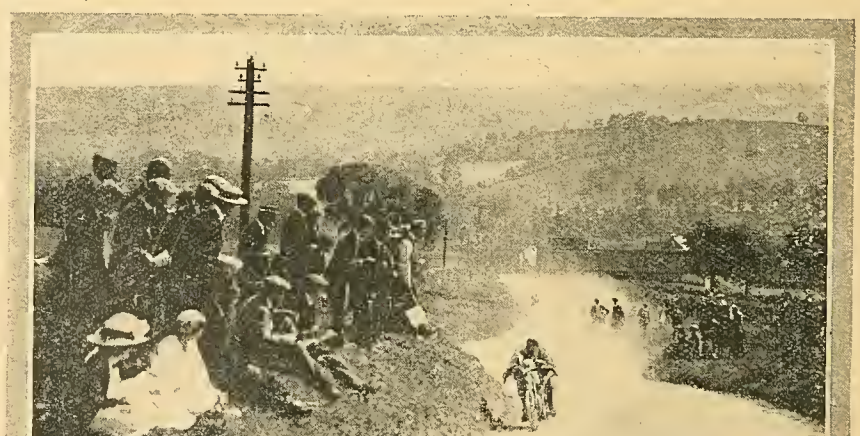
There was a long wait before each of the last mentioned two events which rather spoiled the interest, but the trouble came abont over the starting numbers of a late entry, as the top time-keeper had not been informed of his presence. Results :

S. Brickinshaw (3 Enfield)	56½
W. Thornhill (3½ Douglas)	59½
F. P. Davies (3½ Rudge)	65
On Formula.	
S. Brickinshaw (3 Enfield)	3370
G. B. Fry (2¾ A.J.S.)	5293

Brickinshaw's performance was most meritorious, and his pace most deceptive.

Class XI. was for sidecar machines up to 600 c.c., general and expert, and H. A. Pritchard (4 B.S.A. sc.) and W. W. Douglas (2¾ Douglas sc.) stood out above the rest as the fastest pair. The performance of the little Douglas was well worth seeing, for the driver did not change down till after the S bend. Results :

H. A. Pritchard (4 B.S.A. sc.)	1 21⅗	5849	1
W. W. Douglas (2¾ Douglas sc.)	1 37⅗	6091	2
F. P. Davies (3½ Rudge sc.) ..	1 43⅗		



P. H. A. Matthews (3½ h.p. Rudge) at full speed at the second bend on Weston Lane, near Bath.

The week's results on Palmer Cord Tyres.

The successes we have to chronicle this week, while not so lengthy as in our last advertisement are more than made up by the severity of the course over which they were gained.

SCOTTISH SIX DAYS' TRIALS

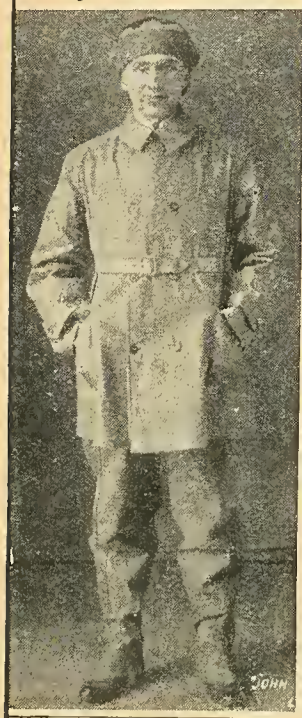
JOHN PIGGOTT LTD.

SUMMER SALE

OVERALLS FOR WIND, DUST, OR RAIN.

"J.P." TOURIST SUIT.



RJ71. **OUR FAMOUS "J.P." TOURIST OVERALL MOTOR SUIT.**

Strong and Waterproof, made of extra stout untearable Fawn Twill, double texture. This material is specially recommended to stand the hard wear that Overalls usually get.

THE JACKET is made double-breasted, 36ins. long, with Prussian collar, throat tab, inside wind cuffs adjustable, tabs on sleeves, square pockets stitched right through, cut roomy, with loops for belt.

THE TROUSERS are made in the Seatless Overall style, with spat and gaiter front, storm gusset, clip fastening, leather waist and boot strap, and shaped to fit well up in fork of leg.

This Outfit complete, is offered during the Sale only at **29/9**
Usually sold 40/-
Seatless Trouser Overalls, **12/9** per pair.
Jackets only 19/- Usual price 21/6.

RJ72. **OUR WELL-KNOWN "IDEAL" WATERPROOF MOTOR CYCLE OVERALL SUIT.**

Double Texture Fawn Paramatta Jacket, made double-breasted with Prussian collar, throat tab, wind cuffs, and tabs on sleeves, square pockets stitched through, 36in. long, cut full in skirt with loops for waist belt. **Leggings**, single legs, shaped to the thigh, gaiter form, storm gusset and strong leather boot strap. This suit complete is offered during the Sale only at **23/9**

RJ73. **THE "BEAVERLINE" OVERALL SUIT.**

Made in best quality Fawn Cashmere Paramatta, lined with a light plush lining. A smart suit and a pliable cloth. Waterproof and well made. Double-breasted Jacket, and Seatless Trouser Overalls, best make and finish. Complete Suit, Sale Price, **45/6**
Jackets only 28/3. Usual Price, 33/6.
Seatless Trouser Overalls **18/3** per pair.

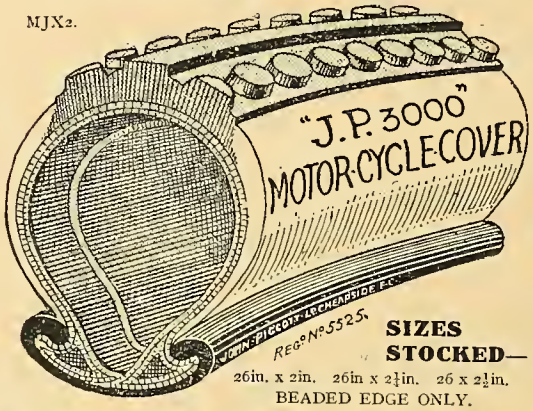
Leather Belts for above Suits, 1/-, 1/6, 1/11 each.

When ordering Motor Suits please state the chest measure taken over Jacket worn, and the inside leg measure; this is most essential.
PATTERNS SENT POST PAID.

THE "J.P." 3,000 MILE MOTOR CYCLE COVER.

"The Cover that HAS stood the Test."

MJX2.



SIZES STOCKED—
26in. x 2in. 26in x 2¼in. 26 x 2½in.
BEADED EDGE ONLY.

GUARANTEED 3,000 MILES. With or without sidecar. **27/6** **WRITE FOR FREE SAMPLE SECTION, SENT POST FREE.**

This Cover is made on the same principle as a heavy Motor Car Tyre, viz: under hydraulic pressure and not as the usual Motor Cycle Covers which are usually a glorified cycle tyre.

It is composed of the best Para Rubber, and fitted with a new Non-skid Tread which has been thoroughly tested and found to be an absolute preventive of skidding.

We are so confident of the wearing properties of this Tyre that we are guaranteeing it for 3,000 Miles.

SEATLESS OVERALL TROUSERS.

The only motor cycle trouser that sufficiently protects the stomach.

RJ74. **PIGGOTT'S SPECIAL OFFER.**

Seatless Trousers made in strong double texture Fawn Waterproof Twill, with storm gusset at leg, leather boot and waist strap, gaiter and spat front, well made, stitched throughout, all seams sewn and taped. **Sale Price** **9/9** per pair.
Postage 4d.

RJ75. **THE "J.P." TOURIST SEATLESS OVERALLS.** Made of extra stout untearable Fawn Twill, double texture. This material will stand hard wear. These are made exactly as those described above, as supplied with the "Tourist" Suit.
Trousers only, Sale Price **12/9** per pair.

RJ76. **THE "BEAVERLINE" SEATLESS OVERALLS.** Made in the best quality Fawn Cashmere Paramatta, with a soft plush lining, well made and best finish. These are exactly as supplied with the "Beaverline" Suit listed above.
Trousers only Sale Price **18/3** per pair.

MOTOR CYCLE LEGGINGS

For Knockabout Wear.

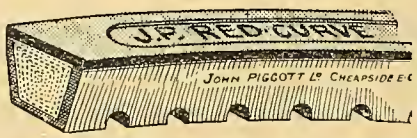
RJ77. Made in strong double texture Fawn Twill, with leather strap under boot. All seams sewn and taped. Just the Legging for knockabout wear. In three lengths of leg, 28, 30, 32in.
Sale Price **4/11**
Postage 4d.

RJ78. **Double Texture Black or Fawn Paramatta MOTOR LEGGINGS,** made in the plain pull-on style, no buttons or fasteners, very easy to pull on and off. **Special Sale Price** **6/6** per pair.
Postage 4d.

GOGGLES, The New "LA SVELTE."

Double Folding Shape with Patent Spring Centre and Plush Edges, well ventilated. Special offer.
Usual Price 3/9. **Sale Price** **1/5½** Postage 2d.

BARGAINS FOR MOTOR CYCLISTS, THE 'J.P.' RED CURVE MOTOR CYCLE BELT



MJX8.

Non-Stretching!
Non-Cracking!!
Non-Slipping!!!

The Belt is made of pure Para Rubber and Best Canvas, and is so constructed that it will at all times take a natural curve.

Size 1in. **1/7** ft., ¾in. **1/5** ft., ¾in. **1/3** ft., ⅝in **1/1** ft.

CHEAPSIDE LONDON.

WRITE US TO-DAY, OUR BARGAIN LIST CONTAINING 86 PAGES WILL BE SENT FREE. OF SURE INTEREST TO ALL MOTOR CYCLISTS.

An Open Hill-climb in the West.—

Class XII. (same as XI. but experts barred) left Douglas a winner by $\frac{4}{5}$s. from F. P. Davies, with E. A. Davies (3½ Premier) third. G. H. Tucker provided the only failure throughout the day. Results :

	Time. m. s.	Fig. of merit.	Form. pos.
W. W. Douglas (2¾ Douglas sc.)	1 40	6368	1
F. P. Davies (3½ Rudge sc.) ..	1 40⅘	8355	2
E. A. Davies (3½ Premier sc.) ..	2 5		

In Class XIII., for sidecar machines over 600 c.c., R. Clayton was the first to start on a 6 Matchless sc., but was overtaken by Wade (6 Zenith), who returned to the starting point, and after a long interval came up very fast. He was, however, beaten on time by G. H. Fry on an 8 Zenith. The 8 h.p. did not appear to be so fast, but this was probably because of its higher gear and quiet exhaust. Results :

G. H. Fry (8 Zenith sc.)	1 10	7594	2
A. B. Wade (6 Zenith sc.)	1 13	6384	1
R. Clayton (6 Matchless sc.) ..	2 16⅘		

Class XV., for cycle cars under 1,100 c.c. produced only three starters, as F. G. Cox (Morgan) had trouble and never reached the starter. G. H. Fry (Morgan) made the best ascent, but F. Stone (Morgan) and W. W. Douglas (Douglas c.c.) both came up very well, the even exhaust of the Douglas sounding like a high-geared four-cylinder. Results :

G. H. Fry (Morgan)	1 28⅖	8966	2
F. Stone (Morgan)	1 42⅗		
W. W Douglas (Douglas)	1 44⅘	8388	1

Stone was the only one to make an ascent in Class XVI. (same as XV., expert barred), but Douglas's time in the previous class was allowed to stand, which makes him win on formula. Results :

F. Stone	1 40	11175	2
W. W. Douglas	1 43⅘	8388	1

The above results are provisional, and are subject to confirmation of the club committee.

The A.C.U. Six Days Trials.

Summary of Conditions governing Next Week's Trial, with Sheffield as a Centre.

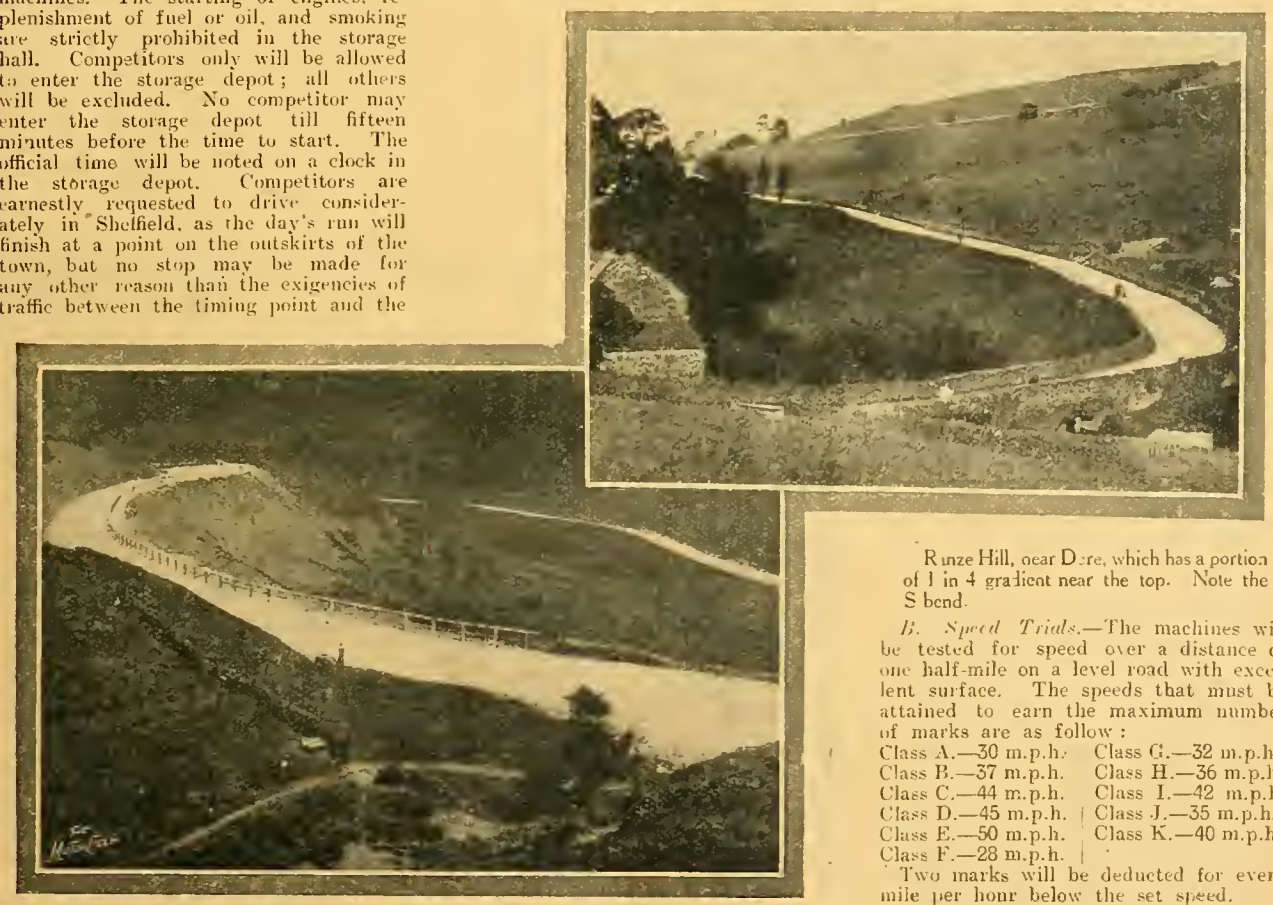
QUITE a good entry has been received for the A.C.U. Six Days Trials, the total number of riders being 132. The entry is also a representative one, comprising as it does all the best known makes.

The final regulations state that the competing machines must be at the official storage depot, the Olympia Skating Rink, Bramall Lane, Sheffield, not later than 10 a.m. on the 5th inst. Here the motor cycles will be examined to see that they comply with the regulations. Petrol and oil tanks must be filled prior to the presentation of the machines. The starting of engines, replenishment of fuel or oil, and smoking are strictly prohibited in the storage hall. Competitors only will be allowed to enter the storage depot; all others will be excluded. No competitor may enter the storage depot till fifteen minutes before the time to start. The official time will be noted on a clock in the storage depot. Competitors are earnestly requested to drive considerately in Sheffield, as the day's run will finish at a point on the outskirts of the town, but no stop may be made for any other reason than the exigencies of traffic between the timing point and the depot. Any competitor who may be prosecuted for excessive speed may, if the stewards are satisfied that excessive speed was indulged in, be disqualified by the stewards. Only those spare parts may be used which have been carried on the machine throughout the trial.

The Speed and Brake Tests.

The special tests are as follow :

A. Acceleration, tested by a combined fast and slow climb.—The first fifty yards of a hill are to be climbed slowly, and the following two hundred yards are to be climbed fast. Speeds below 5 m.p.h. on the slow portion or above 25 m.p.h. on the fast portion will be reckoned as 5 m.p.h. and 25 m.p.h. respectively, and such speeds will earn full marks. Zigzag driving on the slow portion is not permitted. If a competitor fails in the acceleration test, he may be allowed one more attempt; touching the ground with the feet will constitute a failure. To calculate the marks for acceleration, the rate of speed over the fast portion will be divided by the rate of speed over the slow portion and multiplied by six. The maximum number of marks is thirty.



Another winding test hill—Mam Tor.

Rinze Hill, near Dore, which has a portion of 1 in 4 gradient near the top. Note the S bend.

B. Speed Trials.—The machines will be tested for speed over a distance of one half-mile on a level road with excellent surface. The speeds that must be attained to earn the maximum number of marks are as follow :

Class A.—30 m.p.h.	Class G.—32 m.p.h.
Class B.—37 m.p.h.	Class H.—36 m.p.h.
Class C.—44 m.p.h.	Class I.—42 m.p.h.
Class D.—45 m.p.h.	Class J.—35 m.p.h.
Class E.—50 m.p.h.	Class K.—40 m.p.h.
Class F.—28 m.p.h.	

Two marks will be deducted for every mile per hour below the set speed.

C. Brake or Deceleration Test.—The brake test will be carried out on level

The A.C.U. Six Days Trials.

road. Competitors should approach the starting flag at a speed of not less than 20 m.p.h. On passing this flag the brakes must be applied in such a manner as to stop the machine in the shortest possible distance. Every machine is to remain in the place at which it comes to rest until its position has been recorded. Both the time and distance occupied in pulling up will then have been noted and marks will be awarded according to the figure of merit given by the formula:

$$\frac{\text{Distance}}{\text{Time}^2}$$

Competitors should note that:

1. The formula automatically compensates for differences in the initial speed of the riders.

2. Nevertheless, any rider whose initial speed is found, on calculation, to be less than 18 m.p.h. may be disqualified.

3. There is nothing to be gained by the application of brakes before reaching the starting flag, but any competitor guilty of so doing may be disqualified.

4. Any competitor falling off in the brake test, or whose machine gets out of control, may be penalised ten marks.

D. Mudguards.—Machines may be inspected at any suitable time during the trial for efficiency and adequacy of mudguards.

E. Restarting.—Machines will be stopped on the ascent of a hill, and, after restarting, will be required to cover fifteen yards within twelve seconds, except in Classes B, C, D, and E, which must cover the fifteen yards in ten seconds. Engine must be firing and competitor seated before the completion of the distance. Two marks will be deducted for every second or part of a second in excess of the said twelve or ten seconds. No second attempt will be allowed.

F. Quick Starting.—After a luncheon interval machines will be tested for quickness of starting. The machine must not be touched until the word to start is given, when the engine must be started, and then, with engine firing and competitor seated before the distance is completed,

Motor bicycles must cover fifty yards within 40s.

Sidecars must cover fifty yards within 60s.

Cycle cars must cover fifty yards within 3m.

Passengers may be seated before the commencement of this test. One mark will be deducted for every second or part of a second in excess of the said 40s., 60s., or 3m.

S. Numbers.—Both front and rear numbers (supplied by the Union) must be displayed. The latter, except in the case of cycle cars, must be worn on the driver's back. Slots are provided in the number to allow of a belt being passed through.

9. Order of Starting.—The order of starting, which is determined by ballot, will remain the same throughout the week.

10. Team Prize.—The Union offers a prize for the best performance by a team of three machines of the same make, entered or nominated by a manufacturer or his duly accredited representative before the start of the trial, provided at least four teams are so nominated.

All official notices will be posted at the temporary local office of the Union, 193, London Road, Sheffield, where all enquiries should be made.

Scottish Six Days Trial.

JUDGES' REPORT.

IT is customary at the conclusion of a long-distance reliability trial for the judges to give an indication as to the general performance and conduct of the trial; and at the conclusion of the sixth Scottish Six Days Reliability Trial the judges are of opinion that they can state briefly the outstanding features of the trial as follow:

Dealing first with the entry, which came to 125, this included practically all the best known makes, and the entry can therefore be put down as thoroughly representative. The number of gold medals, fifty-five in all, is very satisfactory. The number of retirals, forty-four, is somewhat high, and can be accounted for in the following way:

First.—A somewhat unnecessary rashness displayed by some entrants in their riding.

Second.—A decided weakness in frame construction both of motor cycle and sidecar, especially noticeable with regard to certain makes.

Third — A somewhat unexpected amount of mechanical trouble.

Of the machines that finished, the great majority finished in very good condition, considering the strenuous nature of the trial.

Dealing with the hill-climbing performances, these were, taken all over, good, although a few riders appeared to have great difficulty on every one of the observed hills.

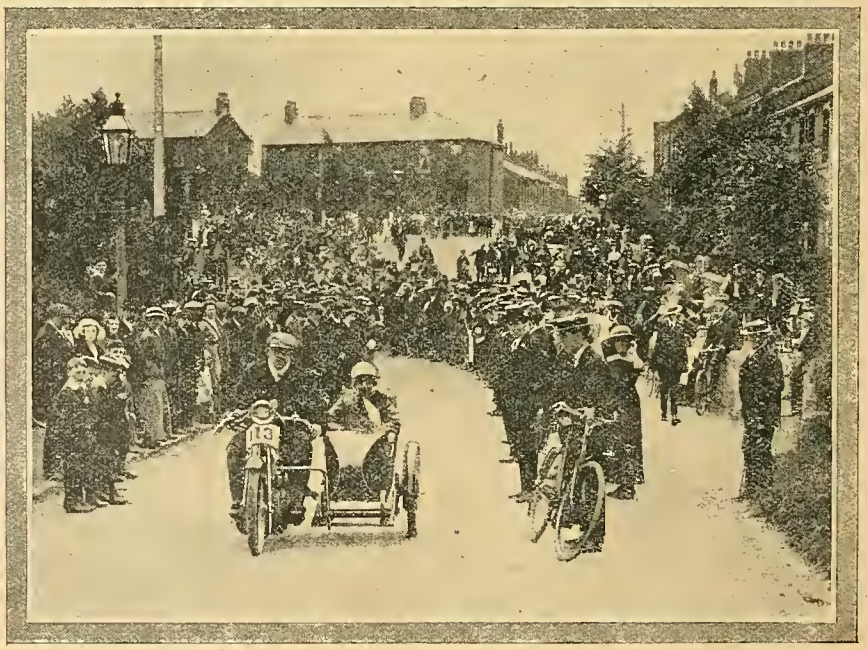
The performance of the cycle cars was good, and showed an improvement on former years.

The protests were few in number, and would have been still fewer had entrants perused the regulations more carefully.

The judges had little difficulty in awarding the Manufacturers' Team Prize to the Indian team, all three members of which gained full marks. The Club Team Prize was won by the Motor Cycling Club, represented by three Rover motor cycles, with comparative ease. All the other special awards the judges find impossible to allocate, as several riders in the respective classes put up equally good performances.

With reference to W. B. Gibb, No. 124, losing 10 marks under the condition of machine heading, the judges, although they take no account of accidents, feel that it is only just to state that all the damage was caused by fire.

On two occasions the route had to be altered at the last minute through the road being washed away, but the judges are pleased to state that these alterations were of little consequence, and were carried through with comparative ease. Finally, the judges have to comment very favourably on the conduct of the competitors during the trial.



An A.J.S. sidecar driver starting from Preston in the N.W.A.A. team trial. Observe the long line of competitors.

"THE MOTOR CYCLE" LIST OF WEEK-END CLUB EVENTS

July 4th.—York County M.C.C. Second quarterly trial.
" 4th.—Dublin and District M.C.C. Reliability trial to Glendalough, 3 p.m.
" 4th.—Coatbridge and District M.C.C. Club run to Troon, 2 p.m.
" 4th.—Motor Cycle Union of Ireland (Ulster Centre). Reliability trial for sidecars and cycle cars.
" 4th.—Middlesbrough and District M.C.C. Run to Castleton for Stockton hill-climb.
" 4th.—Finsbury Park C. and M.C. Run to Canvey Island, Southend-on-Sea.
July 8th.—Folkestone and District M.C.C. Run to Waldershare Galleries 2.30 p.m.
" 8th.—Plymouth and District M.C.C. Hill-climb at Moorshop, 6 p.m.
" 8th.—Kilmarnock and District M.C.C. Paperchase, 6.30 p.m.
" 8th.—Cardiff and District M.C.C. Speed-judging contest.
" 9th.—North-West London. Gymkhana at Finchley Horticultural Show, 5 p.m.

Crossgates and District M.C.C.

The quarterly speed trials were held on the 24th ult. on a straight half-mile; good sport was witnessed and fast times obtained. Results:

SOLO.—1, H. Braithwaite (3½ Triumph); 2, J. Tetley (4 Triumph).
SIDECAR.—1, R. Horsfall (4 Bradbury); 2, H. Braithwaite (3½ Triumph).

The course was over a private road, which is considered the fastest and best for such events in the North of England.

Middlesbrough M.C.C.

On June 24th the competition for the Gjers Cup was run off over a course of 206 miles from Middlesbrough to Penrith and back. The winner proved to be C. W. Smith (3 Enfield), who thus holds the cup for twelve months, and also wins a gold medal. The second man was J. H. Dale (4 Triumph) and the third F. Dixon (7 Indian sc.).

Dorset A.C.

Hill-climbing competitions are fixed to take place on July 8th, and a suitable gradient in the shape of Zigzag Hill, Shaftesbury, has been selected for the event. The start will be at 1 p.m., and late entries will be accepted up to July 4th at an extra fee of 2s. 6d., although in the ordinary way entry forms should have been sent in by July 1st. In all, there are four classes of events, which are as follow:

Class 1.—Cars (c.c. exceeding 1,100).
Class 2.—Cycle cars (c.c. not exceeding 1,100).
Class 3.—Motor cycles with sidecars.
Class 4.—Motor cycles solo.

The handicap for cycle cars and for motor cycles (solo or otherwise) will be determined from the following formula:

$$\frac{\text{Total weight in lb.}}{\text{Time in secs.} \times \text{c.c. of cylinders.}}$$

Further information can be obtained from the hon. sec., M. J. Raymond, The Croft, Wimborne.

North-West London M.C.C.

The members' hill-climb was held last Saturday on a fresh hill near Bovingdon, and produced good sport, with the following results:

ON FORMULA $\frac{W}{C \times T^2}$.

500 c.c.—1, J. F. Fitch (3½ B.S.A.)
1,000 c.c.—1, W. C. Knight (8 Bounds-Jap); 2, H. Marshall (7 Indian).
1,100 c.c. (PASSENGER MACHINES).—1, A. J. Dreydel (7 Matchless sc.); 2, C. H. Auty (4 James sc.); 3, Welby King (7 V.S.-Jap sc.)

ON TIME.

SOLO.—1, H. Marshall (Indian); 2, W. C. Knight (Bounds-Jap).
PASSENGER.—1, W. C. Knight; 2, A. J. Dreydel.

The speed trials on the previous Saturday took place over a deserted straight stretch of one mile on a by-road in Bucks. All classes were included in one sealed handicap, which disclosed the following winners:

1.	P. H. Goddard (2¾ Douglas)	47.7 m.p.h.
2.	H. J. Pooley (3½ Premier sc.)	37.9 m.p.h.
3.	W. E. McKay (5-6 Bat sc.)	51.5 m.p.h.

ON TIME ONLY.

1.	S. King Smith (5-6 Bat)	65.3 m.p.h.
2.	W. E. McKay (5-6 Bat)	64.2 m.p.h.
3.	W. C. Knight (8 Bounds-Jap)	51.5 m.p.h.

Cheltenham M.C.C.

A competition confined to amateur members took place on the 20th ult. over a difficult course. Result:

1, P. W. Ford (3½ B.S.A.), 500 marks; 2, R. F. D. Baker (7 Indian), 480; 3, P. O. Edmunds (3½ New Hudson), 470.

Carlyle (Chelsea) C. and M.C.C.

The recent hill-climb at Kop Hill resulted in a win for Sr. John E. Scheffler (3½ Premier), who made fastest time and was first on *The Motor Cycle* formula.

July fixtures include a sixty-mile non-stop jaunt, and a fault-finding competition in connection with the club picnic.

Coatbridge and District M.C.C.

The above club held a flying half-mile on the 24th ult. Results:

3½ h.p. T.T. CLASS.—1, J. C. Sword (Triumph), time 36⅘s.; 2, H. Lawson (Premier), time 36⅘s.
3½ h.p. TOURING CLASS.—J. Rennie (Triumph), time 42⅘s.
TOURING LIGHTWEIGHTS.—T. A. McCreadie (Sunbeam), time 52⅘s.
SIDECARS.—H. Clark (Triumph), time 54s.

Westmorland M.C.C.

A petrol consumption trial was held on the 18th ult. over a thirty-five mile circular course, including Shap Fell. The winner's average worked out at slightly over 190 m.p.g. Result:

		formula.			formula.
1.	L. S. Parker (3½ Scott)	47	3.	G. W. Braithwaite (3½ Rudge)	35
2.	N. Abbatt (3½ Rover)	38	4.	M. Oliverson (2¾ A.J.S. sc.)	24

Blackheath and District M.C.

A night trial took place on the 20th ult. The first competitor was started at 10 p.m. for Hythe. On the return journey the first competitor left Hythe at 3.30 a.m., arriving at Farningham in time for breakfast. Results:

		Total error at checks.
1.	W. L. Strong (3½ Rudge-Multi)	2m. 31⅘s.
2.	G. W. Poynton (7 Matchless sc.)	3m. 20⅘s.
3.	C. E. H. Pinkerton (7 Indian sc.)	6m. 5⅘s.

Cardiff and District M.C.C.

The annual speed trials were held near Cowbridge on the 20th ult. The event was a great success, there being sixty-four entries. Results:

CLASS I. (Touring Lightweights).—1, A. M. Jones (2¾ Douglas); 2, L. E. Sawyer (2¾ Enfield).
CLASS II. (T.T. Lightweights).—1, A. M. Jones (2¾ Douglas); 2, L. E. Sawyer (2¾ Enfield).
CLASS III. (Touring Machines, 560 c.c.)—1, Luther Davies (3½ Norton); 2, L. E. Sawyer (2¾ Enfield).
CLASS IV. (T.T. Machines, 560 c.c.)—1, Luther Davies (3½ Norton); 2, E. J. Dart (3½ Triumph).
CLASS V. (Touring Machines, 750 c.c.)—1, A. B. Wade (5-6 Zenith); 2, E. Chapman (4-5 Zenith).
CLASS VI. (any Machine 750 c.c.)—1, A. B. Wade (5-6 Zenith); 2, W. Pollard (3½ Stevens).
CLASS VII. (Unlimited Machines).—1, S. H. Williams (7-9 Indian); 2, E. Chapman (4-5 Zenith).
CLASS VIII. (Touring Sidecars, 560 c.c.)—1, H. Davies (3½ James).
CLASS IX. (any Sidecar 560 c.c.)—1, J. Barron (3½ Wright).
CLASS X. (any Sidecar 750 c.c.)—1, A. B. Wade (5-6 Zenith); 2, E. Chapman (4-5 Zenith).
CLASS XI. (Unlimited Sidecars).—1, A. B. Wade (5-6 Zenith); 2, E. Chapman (4-5 Zenith).
CLASS XII. (Unlimited Cycle Cars).—1, J. W. Foreman (8 Morgan)

Calthorpe Trophy Awards.

The official awards of the Sutton Coldfield miniature trial are now announced. The gold medal winners are as given in our last issue, page 868, and the following win silver medals: N. Hall (2 O.K.), T. G. Meeten (2 O.K.), W. Hudson (2 O.K.), A. F. Plint (1½ Dayton), G. Strange (2 O.K.), L. N. Bennett (2 Calthorpe), H. Hoffman (2 N.S.U.), T. Peek (2 Calthorpe), and T. Pollock (2 Dunkley).

Wanted an S.P.C.E.

As we passed through Cheltenham during the past week-end we noticed an extraordinary vehicle being propelled along the road by an Auto Wheel. It consisted of a cycle and sidecar carrying three children besides two adults. We take it that the owner is content with strictly moderate speeds, but though the performance speaks volumes for the Auto Wheel, a society should certainly be formed for the prevention of cruelty to engines.

Motor Cycles on Cigarette Cards.

Advertisers are ever on the look out for some new idea to create public interest, and the motor cycle has now been brought into use in this way. Messrs. Golds, Ltd., of Birmingham, are now issuing cigarette cards with photographic reproductions of various motor cycles and a few words as to their special merits printed thereon.

F. W. Barnes Recovering.

We have received a letter from F. W. Barnes, so well-known in connection with Zenith motor cycles, saying he is going on well after his bad fall at Weybridge when piloting the car containing Queen Alexandra and Empress Marie of Russia on their journey to Brooklands on the occasion of the recent Red Cross demonstration. It seems that a policeman signalled to Barnes to slow down and then apparently waved him on, but again got in the way, with the result that the rider, to avoid running over the policeman, swerved violently and the machine turned a somersault, Barnes receiving several severe injuries to his head. This unfortunate accident explains his absence from last week's speed trials.

Hill-climbing in Switzerland.

An International hill-climb took place on the 21st ult. from Nyon to St. Cergues. The distance is 14·6 km., and the rise about 700 metres. Results: Motor cycles.—Class I. (250 c.c.), C. Perrottin (Motosacoche), 15m. 53⅕s. Class II. (350 c.c.), L. Progin (Motosacoche), 13m. 52⅘s. Class III. (500 c.c.), C. Lavanchy (Motosacoche), 12m. 54⅘s.—record. Class IV. (750 c.c.), Alfter (Moser St. Aubin), 15m. 18⅖s. Sidecars.—Class VII. (500 c.c.), J. Neher (Motosacoche), 21m. 50⅗s. Class VIII. (750 c.c.), E. Gex (Motosacoche), 17m. 47s. As will be noticed, the Motosacoche machines scored a great triumph.

The Motor Cycle Grand Prix.

Fifty-nine entries have been received up to the present for the Motor Cycle Grand Prix, or Motor Cycle International Cup race, which will be held at Le Mans on August 15th. There are two classes—up to 350 c.c., for which there are twenty-four entries, and up to 500 c.c., for which there are thirty-five entries. Altogether there are twenty-four English entries, and these are Bailey, Steel and Alexander (Douglas); Mason and Bownas (N.U.T.); Stewart and Trail (N.S.U.); Newman (Ivy-Precision); C. G. Pullin, T. E. Green, and S. A. Rowlandson (Rudge); A. Fenn and N. Holden (B.S.A.); W. F. Newsome, A. Clayton, and J. Cocker (Triumph); and another Douglas rider; L. Boston (N.U.T.); Emerson and Lees (A.B.C.); C. T. Newsome (Rover); C. R. Collier and H. V. Colver (Matchless); A. Riddell (Calthorpe); and P. Douglass (Blackburne). This is the largest English entry for any motor cycle race meeting yet held in France.

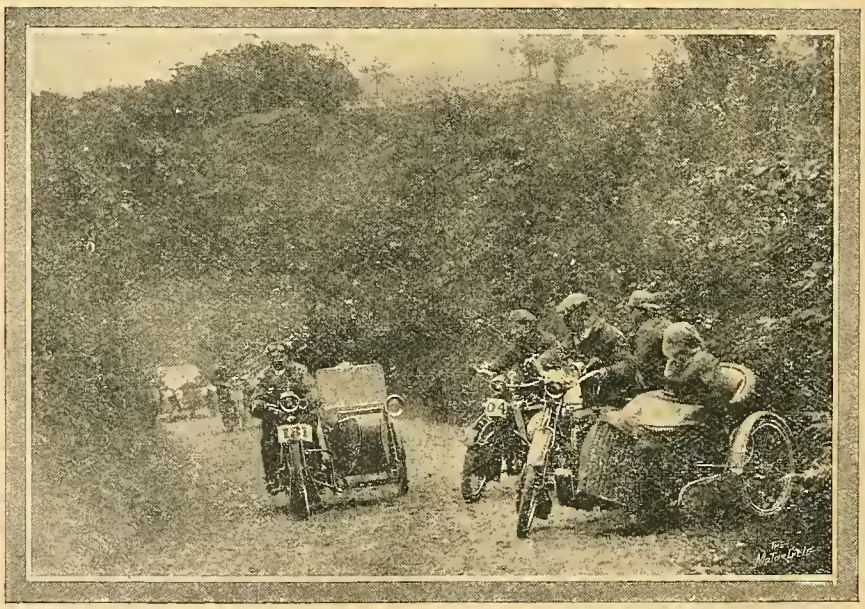
SPECIAL FEATURES.

—o—

A.C.U. SIX DAYS TRIALS NEWS.
A NEW TWIN-CYLINDER MACHINE.
THE WEEK'S COMPETITIONS.

The International Six Days.

At a special committee meeting of the Union Motocycliste de France it has been decided to reduce the average speed for sidecar machines while on the four days of the trial starting from Grenoble from 30 to 28 km. an hour. This concession will be appreciated by the drivers of sidecar machines.



THE N.W.A.A. TRIAL.

A driver of a Triumph sidecar passing less fortunate competitors on one of the test hills near Oakenclough. The N.W.A.A. can always be relied upon to find severe test hills

Colwyn Bay Speed Trials.

For the Colwyn Bay speed trials on Saturday next, organised by the Mersey (Liverpool) M.C., there are upwards of a hundred competitors in the different classes.

Large Two-stroke Engines.

Two large-sized two-stroke twin-cylinder engines are on the stocks and will, we anticipate, shortly be ready for review in these columns. The advent of the larger sizes of twins will be watched with interest in view of the fact that makers of this type of engine have, with one or two exceptions, confined their attentions to small engines suitable for lightweights.

A Trial for Enfield Riders.

A reliability trial, open to users of Enfield motor cycles and sidecar combinations, was held last week, in Leeds, under the auspices of Mr. A. J. Greenwood. Twenty-seven riders started, and twenty-three completed the course to time, the other four being late owing to tyre troubles. The winner proved to be W. Finnerty, who rode a 6 h.p. Enfield combination, on which he gained the twenty guinea cup offered by the Enfield Cycle Co., Ltd.

British Team in the International Trial.

England has already nominated her team for the International Six Days Trial to be held at Grenoble from August 3rd to the 9th, which will be constituted as follows :

350 c.c. Class.—T. C. de la Hay (2¾ Sunbeam).

500 c.c. Class.—W. F. Newsome (3½ Triumph).

C. R. Collier (7 Matchless sc.).

It will be remembered that the British team proved victorious in the Lake District last year.

H. V. Colver is to drive one of the Matchless machines entered for the trial.

There are a good many English entries from private owners and others, and we would again earnestly urge those who require accommodation on the steamers to communicate with the A.C.U.

FUTURE EVENTS.

July 4.—Glasgow M.C.C. Twelve Hours Trial.
July 6-11.—A.C.U. SIX DAYS TRIALS. Sheffield as a centre.
July 18.—Midland Light Car Club Open Trial, for Cycle Cars.
July 18.—Liverpool Amateur M.C.C. Open Trial.
July 18.—M.C.C. Members Meeting at Brooklands.
July 25.—B.M.C.R.C. Race Meeting. N.W.A.A. Gymkhana.
Aug 3-9.—F.I.C.M. INTERNATIONAL SIX DAYS TRIALS. Grenoble as a centre.
Aug 15.—Essex M.C. Race Meeting at Brooklands.
Sept 6-9.—ANGLO-DUTCH TRIAL IN HOLLAND

Leading Firms not in the A.C.U. Trial.

Notwithstanding the excellent entry of 132 for the A.C.U. Six Days Trials next week, we notice the absence of trade entries from such important firms as Rover, Rudge, B.S.A., Indian, Zenith, and F.N. There must surely be a reason for this abstention from the most important reliability trial in England, and one can only conjecture what the manufacturers' grievance with the A.C.U. really is.

Scottish Trials Results.

The M.C.C. team, represented by D. H. Noble, C. T. Newsome, and G. Featherstonhaugh, all mounted on 3½ h.p. Rovers, were awarded the club prize.

A silver medal has been awarded to T. Tennant (3½ h.p. Rudge Multi).

The reason H. Newey, who drove an Ariel with three-speed Ariel countershaft gear, gained no award, was that he unfortunately went off the course on the last day, and was disqualified.

Errors creep into even official programmes, and we learn that the description in the programme of the Scottish Trials of the gear used on T. Silver's 7-9 Quadrant sc. was incorrect, and that Silver used a three-speed Jardine gear box, which gave every satisfaction.

We also learn that the 3½ Edmund, ridden by R. G. MacGibbon, was fitted with an Enfield two-speed gear.

Two-strokes and Lightweights.

A special "two-stroke and lightweight number" of *The Motor Cycle* will be issued on July 23rd.

Debut of the Twin Rudge.

The first illustrated description of an entirely new machine—the 7 h.p. twin-cylinder Rudge—appears in this issue.

The Bristol B. and M.C. Hill-climb.

On going to press we learn that the results of the Bristol B. and M.C. hill-climb, as published on another page, have been confirmed by the Hill-climb Committee.

M.C.C. Meeting at Brooklands.

Thirteen events are on the programme of the M.C.C. sixth private race meeting at Brooklands on Saturday, July 18th. The first event—a three-lap handicap race for 350 c.c. machines—is timed to start at 1 p.m., and the final event at 6.20 p.m.

Timekeepers and Open Competitions.

The Auto Cycle Union desires to inform club secretaries and others interested in the promotion of open competitions that it is laid down in the open competition rules of the Auto Cycle Union that where results of any particular competition wholly or in part depend upon time, then official timekeepers of the Union must be employed

The Fontainebleau Circuit.

In broiling weather this race was run off over varying distances for the different classes on the 28th ult. Motor cycles and sidecars from 250 c.c. to 1,000 c.c. competed, and in the 500 c.c. class, run over 450 km., A. G. Fenn, riding a 3½ B.S.A., proved an easy winner in 6h. 6m. 42s. The other classes resulted as follow: 250 c.c. solo, 360 km., Klein (Terrot); 350 c.c. class, 450 km., Vulliamy (Alcyon); 500 c.c. class (sidecars), 360 km., Lombard (Gladiator); 750 c.c. class (sidecars), 360 km., Meuriot (Rene-Gillett); 1,000 c.c. class (sidecars), Allenay (Indian). There were many special prizes, the Grand Prix de France for sidecars being won by the Motosacoche team.

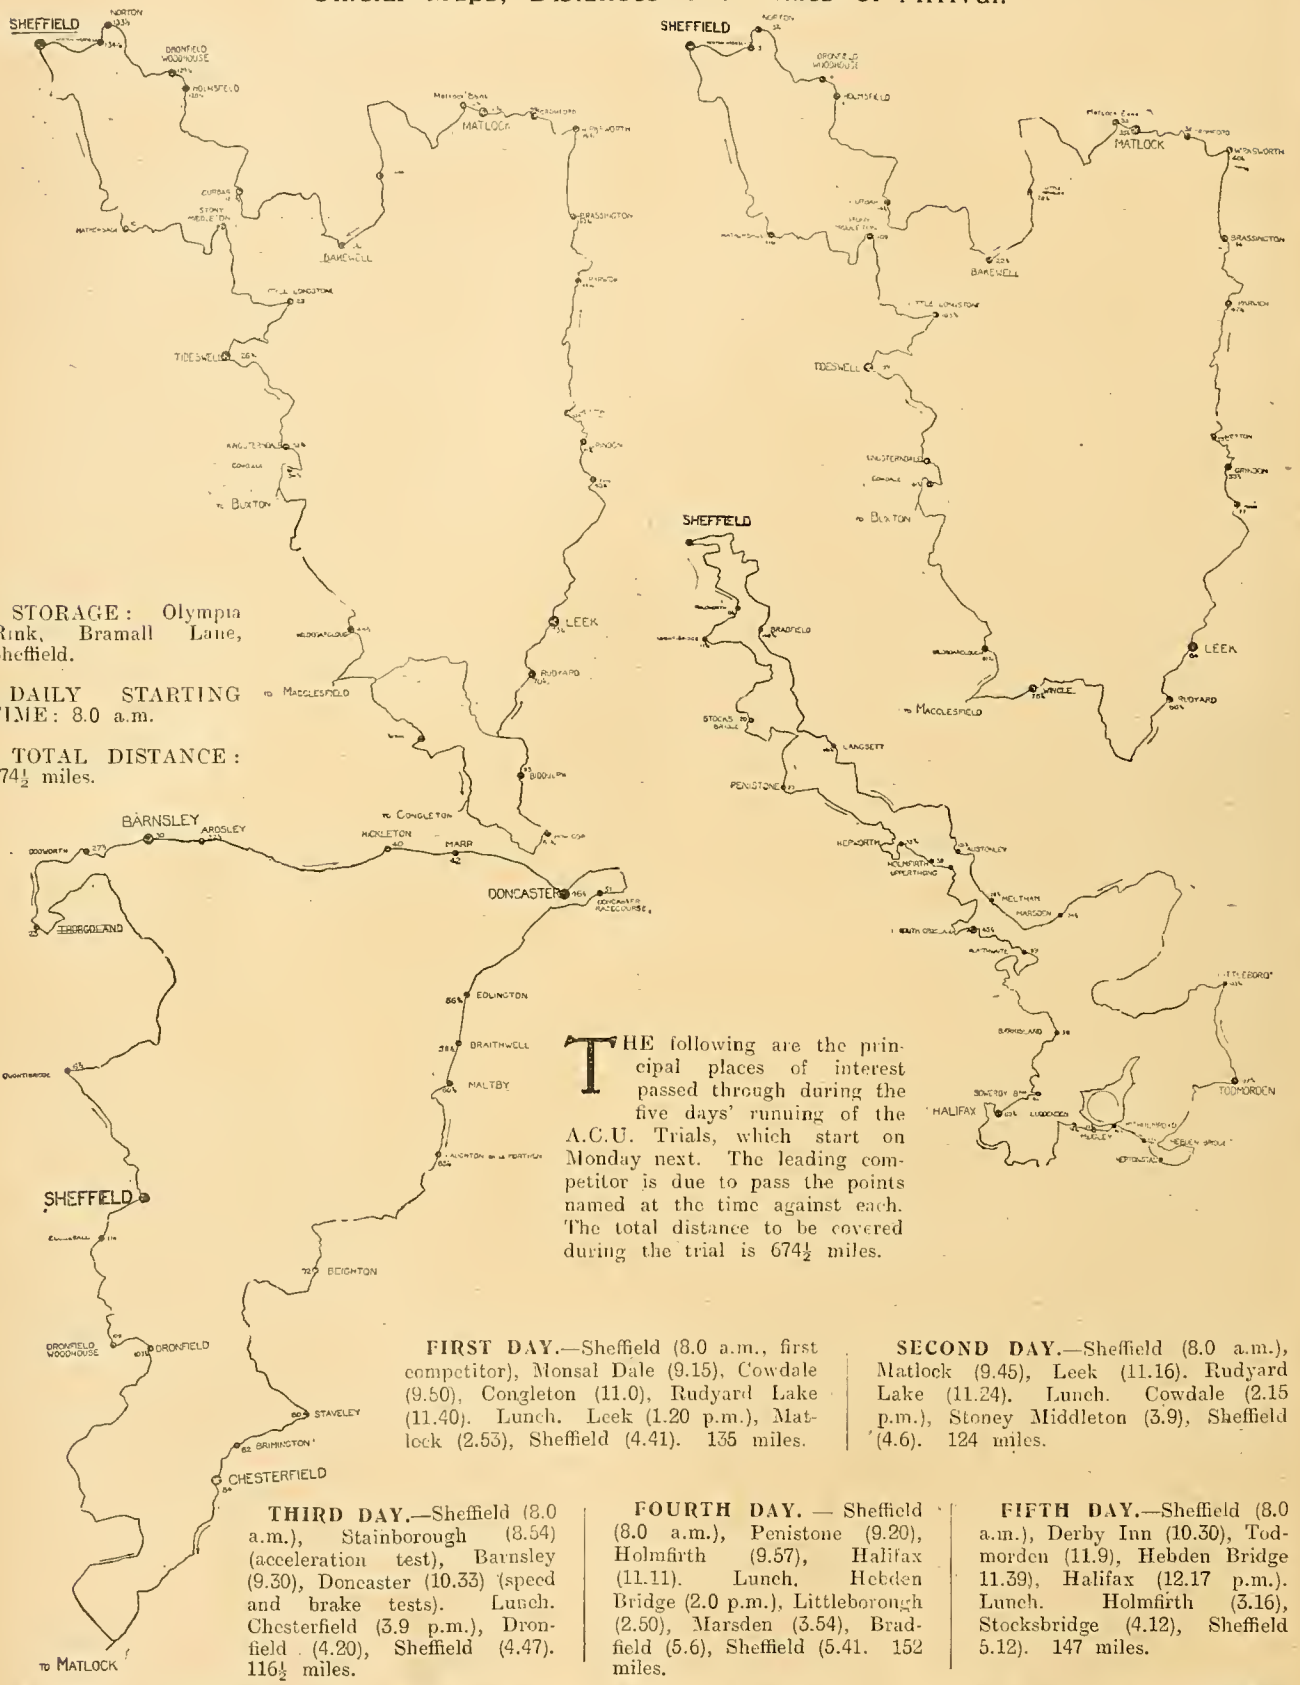
CIRCUIT DE FONTAINEBLEAU.

Scene at the start. As will be seen, numbered waistcoats, similar to those used in the Isle of Man, were worn by all the competitors.

A. G. Fenn, winner of the 500 c.c. class, on a 3½ h.p. B.S.A.

A.C.U. SIX DAYS TRIALS ROUTES.

Official Maps, Distances and Times of Arrival.



STORAGE: Olympia Rink, Bramall Lane, Sheffield.

DAILY STARTING TIME: 8.0 a.m.

TOTAL DISTANCE: 674½ miles.

THE following are the principal places of interest passed through during the five days' running of the A.C.U. Trials, which start on Monday next. The leading competitor is due to pass the points named at the time against each. The total distance to be covered during the trial is 674½ miles.

FIRST DAY.—Sheffield (8.0 a.m., first competitor), Monsal Dale (9.15), Cowdale (9.50), Congleton (11.0), Rudyard Lake (11.40). Lunch. Leek (1.20 p.m.), Matlock (2.53), Sheffield (4.41). 135 miles.

SECOND DAY.—Sheffield (8.0 a.m.), Matlock (9.45), Leek (11.16). Rudyard Lake (11.24). Lunch. Cowdale (2.15 p.m.), Stoney Middleton (3.9), Sheffield (4.6). 124 miles.

THIRD DAY.—Sheffield (8.0 a.m.), Stainborough (8.54) (acceleration test), Barnsley (9.30), Doncaster (10.33) (speed and brake tests). Lunch. Chesterfield (3.9 p.m.), Dronfield (4.20), Sheffield (4.47). 116½ miles.

FOURTH DAY. — Sheffield (8.0 a.m.), Penistone (9.20), Holmfirth (9.57), Halifax (11.11). Lunch. Hebden Bridge (2.0 p.m.), Littleborough (2.50), Marsden (3.54), Bradfield (5.6), Sheffield (5.41. 152 miles.

FIFTH DAY.—Sheffield (8.0 a.m.), Derby Inn (10.30), Todmorden (11.9), Hebden Bridge 11.39), Halifax (12.17 p.m.). Lunch. Holmfirth (3.16), Stocksbridge (4.12), Sheffield 5.12). 147 miles.

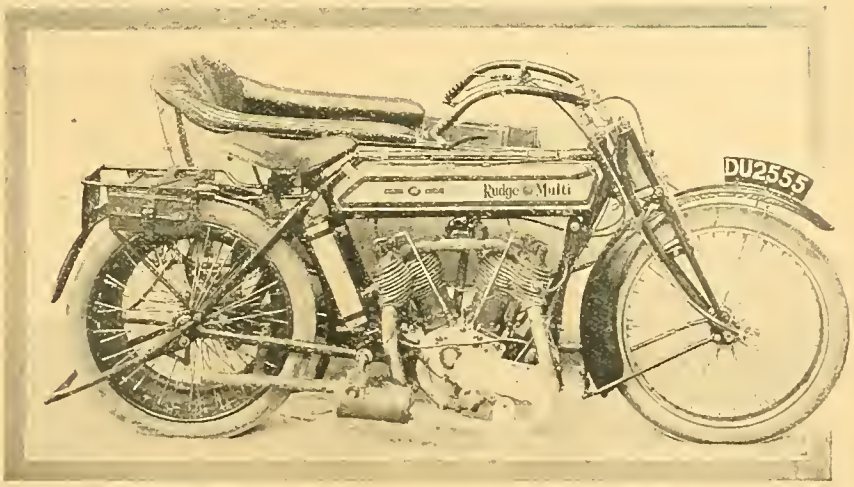
SIXTH DAY.—This is devoted to an examination of the competing machines by the judges in the Storage Hall, Sheffield.

A NEW RUDGE TWIN.

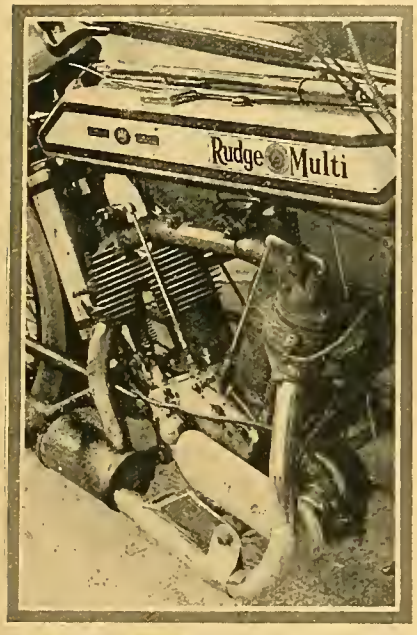
A 7 h.p. V Type Engine for Solo or Sidecar Use.

RUDGE-WHITWORTH, LTD., of Coventry, have decided to market a 7 h.p. twin-cylinder machine which is suitable for solo or sidecar use. It is well known that the Rudge Co. have been studying the twin-cylinder question for some time past, and have had many designs on paper, but the new production which forms the subject of the drawings and photographs accompanying this article will be found to follow very closely Rudge practice in engine design.

Despite the large capacity of the engine, viz., 998 c.c., the new Rudge twin gives no impression of clumsiness—indeed, the latest design is a very taking machine in appearance, its symmetry at once evoking favourable comment. As regards the bicycle portion of the machine, this follows Rudge practice in every particular, so that it is the engine only with which these notes deal. Single



Valve side of the new 7 h.p. Rudge, showing induction pipe, overhead inlet valves, and position of chain driven magneto.



Details of the Rudge twin-cylinder engine.

and twin Rudge engines are interchangeable in the standard design of frame, which is surely an attractive point. The multi-gear is of precisely the same design as on the 3½ h.p. model, and, of course, belt drive is used. What may seem curious on first thoughts is that belts last as long on the big twin as on the 3½ h.p. mount, but this is due to the more even pull of the twin as compared with the single.

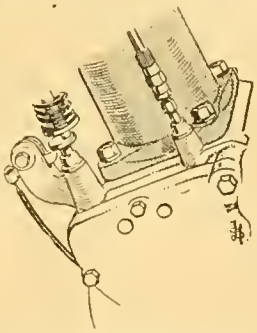
Features of Design.

The cylinders, which have a bore and stroke of 85 × 88 mm., are set at an angle of fifty degrees, and are *dèsaxé* or "offset" in relation to the crankshaft to the extent of half an inch. Forked big end bearings are used, fitted with rollers, and roller bearings are also used at the small ends. The offsetting of the cylinders is claimed to have a beneficial effect in equalising the lubrication. Despite the fact that there are no baffles to either cylinder, it is found in practice that the cylinders are quite evenly lubricated, and, in fact, during the tests the engine has undergone, the first trouble with a sooted plug has yet to be recorded.

Simplicity in the Timing Gear.

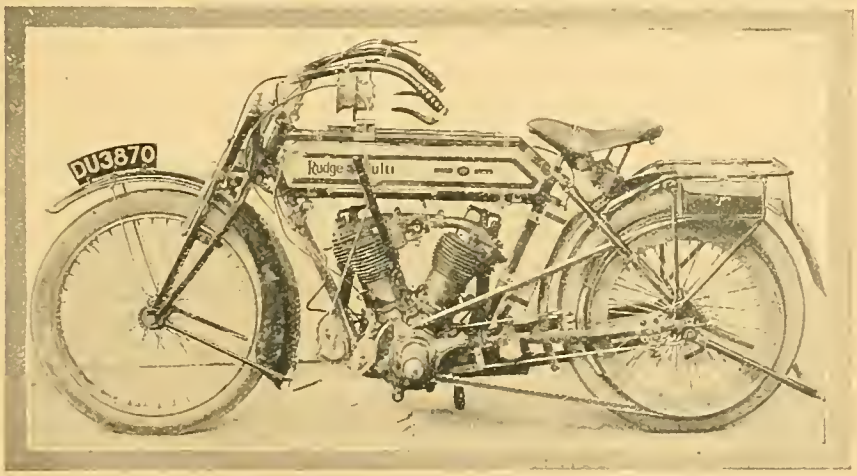
The timing gear is very neatly arranged, only three timing gear wheels being used. The two cams are, of course, similar in shape, and moreover the four rockers are interchangeable, which system is an advantage in assembling the engine, as obviously it is impossible to replace a rocker in its wrong position.

The valve lifters are very neatly arranged. Brackets are cast with the crank case to support the valve lifter wire, the wire casing for the rear cylinder being disposed underneath the projecting timing gear case. The inlet valve rockers are much bigger and sturdier than on the singl -cylinder machine. The pistons are of the standard



Arrangement of tappets and rear exhaust lifter on the 7 h.p. Rudge.

design, having flat tops and a piston ring top and bottom with diagonal slots, the walls of the pistons being recessed

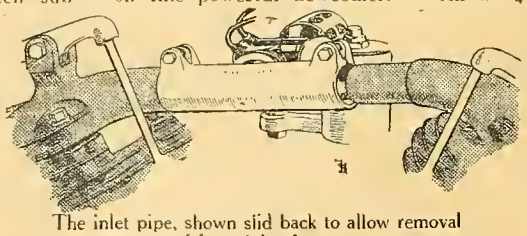


Belt side of the new 998 c.c. Rudge on which the standard Multi gear is employed.

A New Rudge Twin.—

at the sides. The valves are the same as those used on the 3½ h.p. machine.

The new Rudge—we named it the "Rudge Multwin" in the absence of something better—has great promise. Those who have been privileged to try it up to the present are quite enthusiastic in its praises. Right from the commencement the engine has given no trouble, despite the fact that it has been subjected to the most rigorous tests. For instance, in the first six days of its existence it had covered a thousand miles, mostly in connection with the "Rudge Mail Service," which consists of sidecar carriers running backwards and forwards between the Rudge Works at Coventry and Birmingham with several hundredweight of goods. A change of drivers was provided, and the twin was kept at work from early morning till late at night. In addition, the machine has been taken over several severe trials courses in the Midlands, and up all the test hills on the Cotswold Range. Birdlip is no match for the outfit, and it has proved its ability to start from a stand still on this steep hill. The Old Wyche at Malvern has been scaled with ease on this powerful newcomer. With a 3¾ to 1 top gear, the new twin with sidecar attached will keep up a steady fifty miles an hour, and users assure us of the remarkable absence of vibration in the engine.



The inlet pipe, shown slid back to allow removal of front inlet dome.

Economical Running.

As regards consumption, with a sidecar it has been found to be in the neighbourhood of fifty miles per gallon on difficult roads, but it is hoped to do better than this later. The Rudge tank design is eminently suitable for a sidecar, for it will be remembered that the large tank is used solely for petrol, and has a capacity of 2¼ gallons. The oil is carried in a special compartment at the rear of the seat tube, and the oil pump is operated by a pedal on the right footrest.

Shortly we shall be able to speak of the new Rudge "Multwin" from practical experience on the road.

The ballot for starting numbers was to take place to-day (Thursday).

N.W.A.A. TEAM TRIAL.

Twenty-two Teams Compete Together over a Severe Course.

ON the 28th ult. the North-Western Automobile Association held another reliability trial over a course in the district between Lancaster and Preston, which was nearly as severe as the last one held in the Peak.

No fewer than twenty-two teams, comprising eighty-eight competitors (sidecar and solo mixed), were entered by the various clubs affiliated.

Abbeystead Fell, although rather short, proved an obstacle to many of the riders.

The second portion of the trial included the Trough of Bowland from the Yorkshire and much more difficult side, the easier side having been climbed in the morning. Many of the riders were baulked and had to run into the bank.

The results, as declared late in the evening, are as follow:

1. CHESTER CLUB.—Four non-stops. Full mileage, 294. Error of 14m. 3s. J. Morrey (6 A.J.S. sc.), H. Marston (3½ Rudge), E. J. Nevatt (3½ Rover), and R. Dutton (5 Matchless).

2. ROCHDALE "B" TEAM.—Four non-stops. Full mileage. Error of 32m. 47s.

3. PRESTON "B" TEAM.—Full mileage and four non-stops. Error of 68m. 2s.

Beautiful weather favoured the trial.

Caerphilly Open Hill-climb.

Keen Contests on the Welsh Mountains.

A Douglas rider at the bend on Caerphilly Hill in Class VI.

THE Caerphilly open hill-climb took place on Thursday last under ideal conditions, under the auspices of the South Wales Automobile Club and the Cardiff Motor Club. The climb has considerable importance attached to it in Welsh motoring circles, and is always certain to attract a large entry. The hill is 1,194 yards in length, and has a total rise of 387 feet. The gradient at the steepest part is 1 in 6.2. The promising weather outlook of Thursday morning induced thousands of people to visit the scene of the climb, and the mountain side was crowded with spectators at an early hour. It would, indeed, be a difficult matter to find a hill more suitable than Caerphilly for a climbing contest; it is a really severe hill, not only in gradient, but also as requiring great skill and judgment on the part of the riders. At the bottom there is a slight downward gradient for some yards which enables the machines to get going before commencing the ascent. There are three difficult bends, which were responsible for many thrills. At each of the corners the road is cut through the hillside, forming a bank several feet high on either side. It was on these banks that a few of the competitors came to grief. For those classes which were determined on formula $\frac{W}{C \times T^2}$ (*The Motor Cycle* formula) was used.

The first class to be run off was that for sidecar machines. A. B. Wade (5 Zenith) came up at a tremendous pace, but at the last bend dashed up the bank and almost overturned, but completed the climb in 1m. 16⅖s., the fastest time in the class.

It is to be regretted that the cycle car class attracted only three entries, while only two actually competed. J. B. Buckingham (12 Buckingham) made a good climb in 1m. 15⅖s. H. S. F. Morgan, driving an 8 h.p. Morgan, started well, but burst a tyre.

Record for the Hill Broken.

The 350 c.c. class was productive of some clever riding. W. D. Gills (2¾ Douglas) came up well, but wobbled alarmingly at the final bend and lost time. The fastest time was made by H. R. Davies (2¾ Sunbeam), who made the ascent in 1m. 9⅖s. A. W. Jones ran up the bank at the second bend, but remained in his saddle and continued the climb. At the final bend, however, he again went several yards up the bank, and turned a complete somersault. He was fortunate to escape injury, while his Douglas was but slightly damaged.

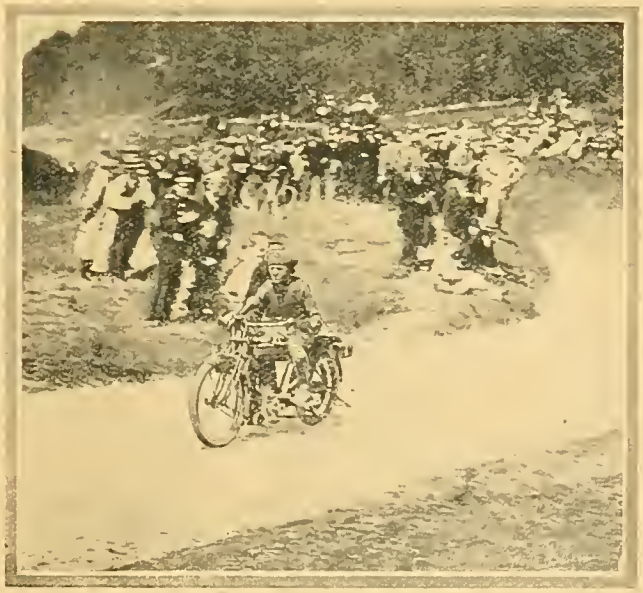
In the 500 c.c. class for touring machines there was only one competitor.

The 500 c.c. single cylinder racing machine class followed. Here the fastest time was made by C. T. Newsome on his Rover. Pollard's Stevens-Precision had a remarkably strident exhaust and climbed well, while the smooth, purring rush of Shirley's Singer gave an impression of high speed.

Only Two 500 c.c. Twins.

Only two machines—both N.U.T.'s—competed in the twin-cylinder 500 c.c. class. H. Ashton (N.U.T.) lost several seconds through rushing up the bank at the second bend.

C. T. Newsome (3½ Rover) made the fastest time of the day in the unlimited capacity class. He made a most



H. Davies (Norton) travelling well past the first corner

Caerphilly Open Hill-climb.—
excellent climb, taking the bends without wobbling. His time was 1m. 2⅖s. This knocks 2⅖s. off Newsome's previous fastest time for the Caerphilly Hill. Results :

CLASS I.—FOR MACHINES NOT EXCEEDING 350 C.C. (Determined on formula.)

		m. s.	Fig. of Merit.
1.	H. R. Davies (2¾ Sunbeam)	1 9⅘	.1811
2.	C. V. Wood (2¾ Douglas)	1 11⅘	.1475
3.	L. E. Sawyer (2¾ Royal Enfield)	1 21⅘	.1367

CLASS II.—FOR TOURING MACHINES EXCEEDING 350 C.C., BUT NOT EXCEEDING 500 C.C. (Determined on formula.)

1.	H. B. Davies (3½ Sunbeam)	1 17⅗	.1257

CLASS III.—FOR RACING SINGLE-CYLINDER MACHINES NOT EXCEEDING 500 C.C. (Decided on time.)

1.	C. T. Newsome (3½ Rover)	1 7⅖
2.	H. R. Davies (3½ Sunbeam)	1 9⅗
3.	J. Cocker (3½ Triumph)	1 10⅘

CLASS IV.—FOR RACING TWIN-CYLINDER MACHINES EXCEEDING 350 C.C., BUT NOT EXCEEDING 500 C.C. (Decided on time.)

1.	F. J. Tanner (3½ N.U.T.)	1 19⅖
2.	H. Aston (3½ N.U.T.)	1 35

CLASS V.—FOR TOURING TWIN-CYLINDER MACHINES EXCEEDING 500 C.C., BUT NOT EXCEEDING 1,000 C.C. (Determined on formula.)

1.	A. B. Wade (5 Zenith)	1 9⅖	.1185
2.	T. P. Geen (7-9 Indian)	1 16	.0792
3.	E. E. Chapman (5 Zenith)	1 28¼	.07601

CLASS VI.—UNLIMITED CAPACITY. (Decided on time.)

		m. s.	Fig. of Merit.
1.	C. T. Newsome (3½ Rover)	1 2⅗	
2.	V. Harrison (3½ Triumph)	1 10	
3.	J. Cocker (3½ Triumph)	1 11	

CLASS VII.—FOR MACHINES, CAPACITY UNLIMITED, WITH SIDECAR AND PASSENGER. (Determined on formula.)

1.	A. B. Wade (5 Zenith)	1 16⅖	.1378
2.	C. T. Newsome (3½ Rover)	1 39½	.1225
3.	L. Davies (4¼ James)	1 43⅖	.1116

CLASS VIII.—FOR CYCLE CARS NOT EXCEEDING 1,100 C.C. (Determined on formula.)

1.	J. F. Buckingham (12 Buckingham)	1 15⅖	.1755

CLASS IX.—FOR TOURING MACHINES NOT EXCEEDING 560 C.C. (Determined on formula.)

1.	H. Davies (3½ Norton)	1 21⅗	.1222
2.	W. Giles (2¾ Douglas)	1 27	.1121
3.	A. Sgonina (5 F.N.)	1 41⅗	.0770

CLASS X.—FOR T.T. MACHINES NOT EXCEEDING 500 C.C. (Decided on time.)

1.	C. V. Wood (2¾ Douglas)	1 12⅖
2.	W. Pollard (3¾ Stevens-Precision)	1 17½
3.	H. Davies (3½ Rover)	1 18

CLASS XI.—FOR TWIN-CYLINDER MACHINES EXCEEDING 480 C.C., BUT NOT EXCEEDING 1,000 C.C. (Determined on formula.)

1.	T. P. Geen (7-9 Indian)	1 16⅖	.0783
2.	E. E. Chapman (5 Zenith)	1 30	.0740

Porthcawl Open Speed Trials.

Keen Contest on the Sands.

ON Saturday last Rest Bay was the scene of the annual open speed trials organised by the South Wales Automobile Club and the Cardiff Motor Club jointly. Despite the fact that there were other competitions of various sorts taking place on the same day, the entries were well above the average, and with the hot, summer-like weather which prevailed, and the excellent organisation, the meeting must be regarded as one of the most successful in the history of Welsh motoring competitions. The start was delayed a couple of hours on account of the high tide and the wet state of the sands. As the tide receded, however, the course soon dried, and after the car events had been run off, was in splendid condition for the motor cycles. The usual crowd, numbering several thousands of spectators, assembled on the cliffs, which act as a natural grand stand, and from which a good view of the races can be obtained.

The various classes were run off with the utmost regularity and precision, enabling the programme to be concluded at a reasonable time.

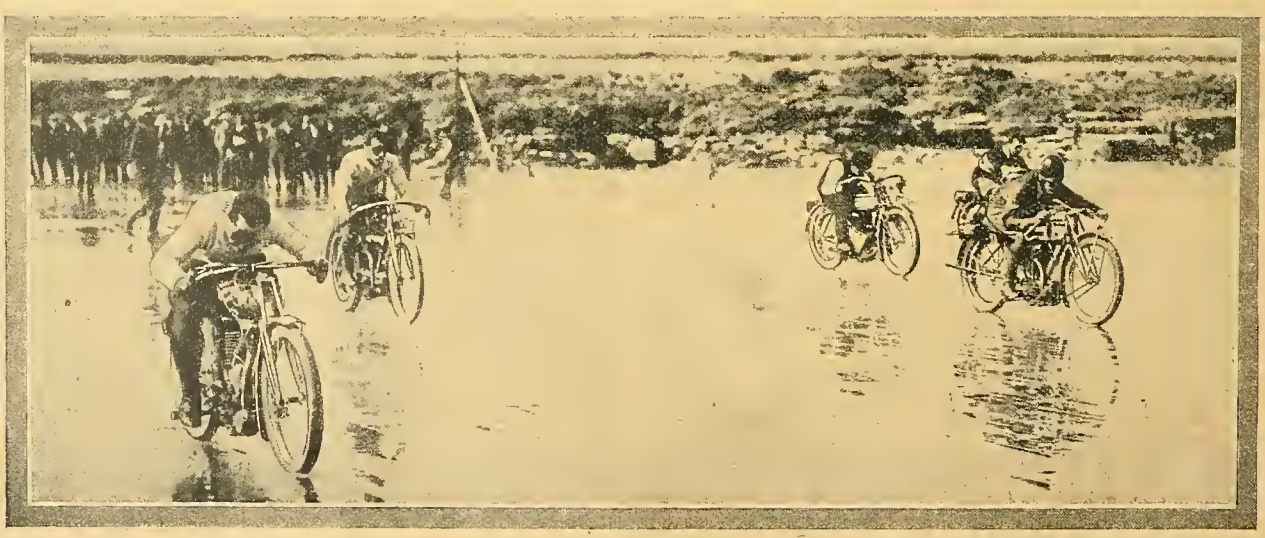
Class I., for lightweights up to 350 c.c., produced five starters, and resulted in an easy win for L. E. Sawyer on a 2¾ Enfield, his time for the straight mile course being 1m. 18⅕s. (46.04 m.p.h.) 22⅘s. separated A. W. Jones (Douglas) from H. Britton, also on a Douglas, the former gaining second place in 1m. 23⅕s.

In the 560 c.c. class, the violent acceleration and remarkable pulling powers of Turner's 3½ N.U.T. attracted a good deal of interest, and for the first couple of hundred yards his chances of winning appeared very rosy indeed. When half the distance had been covered, he wobbled and slackened speed. In a moment Cocker, on the Triumph, shot ahead, while Hill (Rudge) also passed the N.U.T. with ease. When near the finish, Britton, riding a B.S.A., spurted, and beat Turner for third place by 1s. only. The winner's time was 1m. 8⅘s., 1⅕s. ahead of the second machine.

Some good speeds were witnessed in Class III., for machines up to 1,000 c.c. S. B. Briggs, riding a powerful 8 Campion-Jap, won his heat in 1m. 2⅕s., and in the final improved ⅘s. on this time, his speed being 58.63 m.p.h. This was the fastest time of the day. H. W. Tamblyn (7-9 Indian) also rode well, and covered the course in 1m. 7⅖s. V. Harrison (Triumph) beat Turner, the N.U.T. rider, for third place by ⅘s.

The 600 c.c. sidecar class followed, and here J. C. Moore, on a 3½ Rudge, enjoyed an easy victory in 1m. 26s. A 3½ and 4¼ James were second and third respectively. The former, ridden by H. Davies, beat the 4¼ machine with the greatest possible ease.

The 1,000 c.c. sidecar class saw the Campion-Jap again victorious. Briggs did not start so well as expected, but



Just after the start of Class II., for 500 c.c. machines.

L. Davies (James sidecar) starting at the Porthcawl speed trials.

picked up wonderfully and accomplished the course in 1m. 11⅘s. (50.56 m.p.h.). J. C. Moore (Rudge) passed the finishing post 8⅘s. later, E. E. Chapman (5 Zenith) being third in 1m. 42⅖s.

The cycle car class was one of the most interesting contests of the day, although there were only three competitors. It was a close race between J. F. Buckingham's 12 h.p. Buckingham and H. E. Moon's 8 h.p. Morgan, the result being in the balance until the last 150 yards or so, when the twelve horse machine steadily forged ahead. As it was, the finish was a near thing, the Morgan being defeated by 2⅘s. only. The third competitor was W. D. Hawkes (8 Victor-Precision), whose time was 1m. 30s., 14⅗s. behind the Buckingham.

The complete results are as follow:

CLASS I.—FOR MACHINES NOT EXCEEDING 350 C.C. (Open).

	Bore & Stroke.	Time.	M.P.H.
Heat 1.			
L. E. Sawyer (2¾ Royal Enfield)	54 × 75	1m. 19⅕s.	45.45
Heat 2.			
H. Britton (2¾ Douglas)	60½ × 60	1m. 45⅖s.	34.03
Final.			
L. E. Sawyer (2¾ Royal Enfield)	54 × 75	1m. 18⅘s.	46.01
A. W. Jones (2¾ Douglas)	60½ × 60	1m. 23⅕s.	43.27
H. Britton (2¾ Douglas)	60½ × 60	1m. 46s.	33.96

CLASS II.—FOR MACHINES NOT EXCEEDING 500 C.C. (Open)

Heat 1.			
G. Clarke (3½ Rudge)	85 × 88	1m. 22⅘s.	49.86
Heat 2.			
L. Hill (3½ Rudge)	85 × 88	1m. 13⅖s.	49.05
Heat 3.			
F. J. Turner (3½ N.U.T.)	70 × 64½	1m. 10⅕s.	51.28
Final.			
J. Cocker (3½ Triumph)	85 × 88	1m. 8⅕s.	52.33
L. Hill (3½ Rudge)	85 × 88	1m. 10s.	51.13
H. Britton (3½ B.S.A.)	85 × 88	1m. 16⅖s.	47.12
F. J. Turner (3½ N.U.T.)	70 × 64½	1m. 16⅗s.	47.00

CLASS III.—FOR MACHINES NOT EXCEEDING 1,000 C.C. (Open).

Heat 1.			
T. P. Geen (7-9 Indian)	82½ × 93	1m. 7⅖s.	53.41
Heat 2.			
V. Harrison (3½ Triumph)	85 × 88	1m. 8⅗s.	52.63
Heat 3.			
S. B. Briggs (8 Campion-Jap)	90 × 77½	1m. 2⅕s.	57.88
Final.			
S. B. Briggs (8 Campion-Jap)	90 × 77½	1m. 1⅗s.	58.63
H. W. Tamblyn (7-9 Indian)	82½ × 93	1m. 7⅗s.	53.41
V. Harrison (3½ Triumph)	85 × 88	1m. 10s.	51.43
F. J. Turner (3½ N.U.T.)	70 × 64½	1m. 10⅘s.	50.85

CLASS IV.—FOR SIDECAR MACHINES NOT EXCEEDING 600 C.C. (Open).

J. C. Moore (3½ Rudge)	85 × 88	1m. 26s.	41.86
H. Davies (3½ James)	86 × 90	1m. 36⅗s.	37.31
L. Davies (4½ James)	86 × 103	1m. 51⅗s.	31.36

CLASS V.—FOR SIDECAR MACHINES NOT EXCEEDING 1,000 C.C. (Open).

S. B. Briggs (8 Campion-Jap)	90 × 77½	1m. 11⅘s.	50.56
J. C. Moore (3½ Rudge)	85 × 88	1m. 30s.	40.00
E. E. Chapman (5 Zenith)	70 × 85	1m. 42⅖s.	35.16

CLASS VI.—FOR CYCLE CARS NOT EXCEEDING 1,100 C.C. (Open).

J. F. Buckingham (12 Buckingham)	80 × 88	1m. 15⅗s.	47.75
H. E. Moon (8 Morgan)	80 × 77½	1m. 18⅘s.	46.04
W. D. Hawkes (8 Victor-Precision)	85 × 88	1m. 30s.	40.00

CLASS VII.—FOR MOTOR CYCLES NOT EXCEEDING 350 C.C. (Closed).

L. E. Sawyer (2¾ Royal Enfield)	54 × 75	1m. 17⅗s.	46.51
A. W. Jones (2¾ Douglas)	60½ × 60	1m. 40⅘s.	35.80
E. W. Sharman (2¾ Douglas)	60½ × 60	2m. 20s.	25.76

CLASS VIII.—FOR MACHINES NOT EXCEEDING 500 C.C. (Closed)

W. Pollard (3½ Stevens-Precision)	85 × 88	1m. 12s.	50.00
J. C. Moore (3½ Rudge)	85 × 88	1m. 13⅘s.	49.18
H. Davies (3½ Norton)	79 × 100	1m. 19⅗s.	45.34

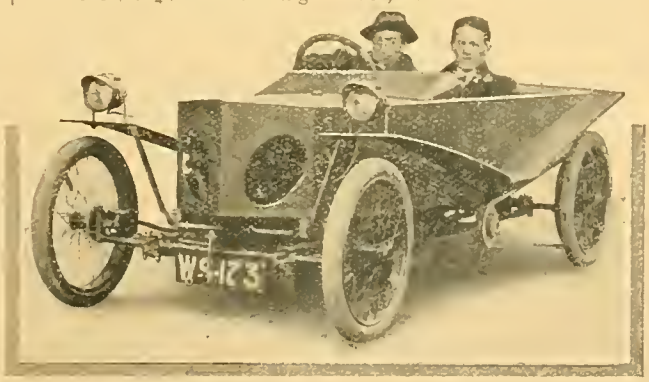
CLASS IX.—FOR MACHINES NOT EXCEEDING 1,000 C.C. (Closed)

J. P. Board (7-9 Indian)	82½ × 93	1m. 3⅘s.	56.43
T. P. Geen (7-9 Indian)	82½ × 93	1m. 8⅗s.	52.63
W. Pollard (3½ Stevens-Precision)	85 × 88	1m. 14s.	48.65

It will be seen from the above that, although good speeds were attained, no one succeeded in reaching the mile a minute gait during the meeting.

SCOTTISH A.C.U. MEET AT CALLANDER.

BEAUTIFUL weather conditions favoured the annual meet of motor cyclists at Callander, under the auspices of the Scottish Auto-Cycle Union. Over 150 were present, mounted on all manner of machines, from the miniature two-stroke to the more elaborate big powered sidecar combination, while many club members made the journey from headquarters by car. The trophy presented by the *Scottish Cyclist and Motor Cyclist* was won by the Glasgow M.C.C., whose members had an aggregate mileage of 1,995 miles to their credit. The winning club is arrived at very simply, the total mileage being obtained by multiplying the distance from headquarters to Callander by the number of members checking in at the meet, checking in time being limited to the hours between 4.30 p.m. and 6 p.m. Last year several of the competitors arrived a few minutes after the latter hour, and were in consequence unable to sign on for their club. One or two were in a similar predicament on Saturday. The Inverness Club, which won the trophy last year, traversed the longest distance, their headquarters being 149 miles from Callander, and as eleven of their members made the journey on Saturday they totalled the splendid mileage of 1,639, which gave them second place. Next to the Glasgow M.C.C., fifty-seven of whose members were present, the Dundee M.C.C., with twenty-one members, had the next largest turnout. The following are the various mileages: Glasgow M.C.C., 1,995; Inverness M.C.C., 1,639; Dundee M.C.C., 1,286½; Campbeltown M.C.C., 828¾; Perth M.C.C., 477; Edinburgh M.C.C. 309; Wishaw M.C.C., 178; West of Scotland M.C.C., 140; Cathcart M.C.C., 70; Falkirk M.C.C., 54½; and Stirling M.C.C., 16.



An Edinburgh participant arrives on a home-made cycle car

SPEED TRIALS IN THE MIDLANDS.

Successful Open Meeting under Pleasant Conditions at Castle Bromwich.

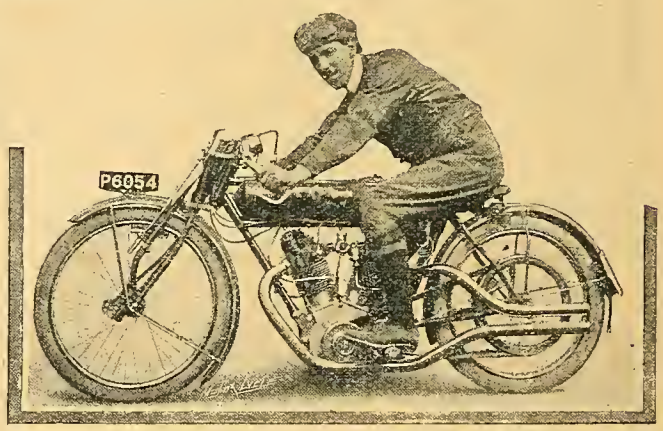
THE Birmingham M.C.C. have every reason to be satisfied with their speed trials on Saturday last. Perfectly ideal weather favoured the event, the sun's rays being tempered with a fresh breeze, which served the double purpose of slightly assisting the riders and blowing the dust away from the spectators in the enclosures. These were well arranged, and a word of praise is due to the excellent catering arrangements, tea being served in a reserved enclosure at small tables—a much pleasanter arrangement than the usual get-what-you-can-how-you-can sort of scramble so often met with. A band was also in attendance, and the large number of spectators followed the racing very keenly, as was evidenced by the applause which greeted any particularly good run.

The track selected was not in good condition, being rather rough, and towards the end of the afternoon it got very loose. It had the merit, however, of being perfectly flat and straight, but the pull up was none too long, and the fastest machines required careful handling to bring them to a rest, as a curve had to be negotiated. However, no one had any real difficulty, and not a single accident of any sort occurred during the afternoon.

The Birmingham Playing Fields at Castle Bromwich would make a perfectly ideal place for motor cycle racing, and we could not help feeling that if only the ground could be prepared it would be possible to run half a dozen machines abreast with perfect safety on such a vast space. Such a spectacle would certainly draw large crowds, and would be preferable in every way to the recently proposed Midland "saucer" track.

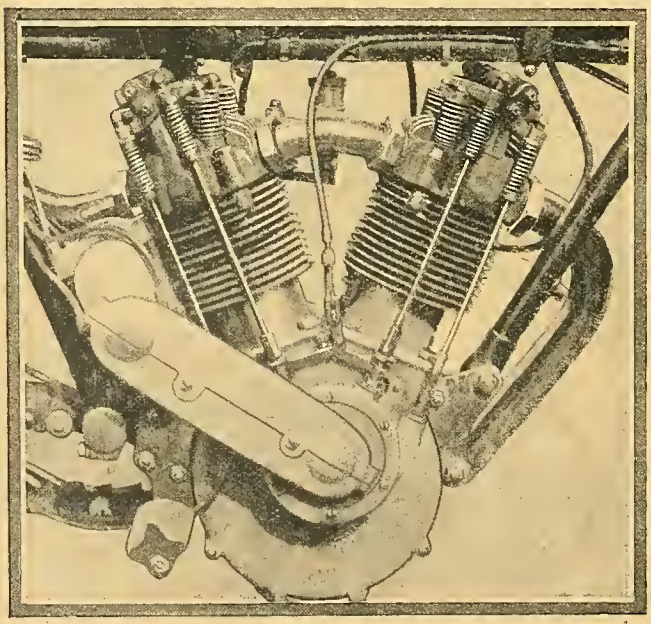
A New Eight Valve Racing Engine.

To turn to the speed trials, quite the most interesting machine present was C. R. Collier's 7 h.p. M.A.G.-engined Matchless. This engine, of 995 c.c., is fitted with four valves per cylinder, arranged on the overhead principle. The rocker arms are superimposed, and the whole engine bears the imprint of most careful design. The valve springs are unusually strong, and the general finish superb. It has the most beautiful "note," and Charlie Collier will probably attack short distance records with it shortly at Brooklands. How fast this machine really is we had no means of judging on Saturday, because the course of five hundred yards with only thirty-five yards for a flying start is not sufficient for a single-geared machine to get going all out, and, in addition, Collier obviously was taking no risks with the pull-up, and always cut out some time before crossing the finishing line. Therefore his best speed of 16⅕s., equal to 63.2 m.p.h., must be looked upon as remarkable. It was equalled by A. J. Brewin on a big Zenith of the same capacity as Collier's machine, but the Gradua gear proved invaluable for a quick start, and as a pure speed machine Collier's Matchless must be awarded the palm.



C. R. Collier and his latest racing machine—a twin-cylinder Matchless, which is fitted with an eight valve (overhead) engine, rated at 7 h.p. He will shortly attempt records on this machine.

C. R. Collier and H. V. Colver were also highly successful in the 500 c.c. classes with the T.T. Matchless machines they rode in the Isle of Man.



The valve mechanism of the new twin-cylinder engine fitted to C. R. Collier's racing Matchless.

Wonderful Speed by a Single Cylinder.

Quite one of the finest performances of the afternoon was achieved by J. W. Draper riding a 3½ Triumph with a 1909 engine, when riding in Class 9 for racing machines up to 500 c.c. He first of all tied with C. R. Collier (3½ Matchless-M.A.G.) and H. Riddell (3½ Precision), all three doing 18⅕ secs., but in the run off, whereas Draper could only equal his previous speed, Collier knocked off a fifth. But Draper got a reward in Class 16 for any solo machine, when he was first on formula. It was in this class that Collier and Brewin deadheated on their big machines, but Collier won the run off by ⅖ sec. in 16⅕ secs. From an old engine Draper got amazing results. He was using a very clever pulley of his own invention. He set it at a certain point for starting, but directly he got going he braked the outer flange with his foot, when the gear immediately went up to the highest point. This proved invaluable for getting a quick start, and the acceleration of this old Triumph was remarkable. It was also in beautiful "tune" and "revved" in the most amazing manner. The remainder of the racing was interesting, and during an interval Albert Milner gave a clever exhibition of trick riding on a Baby Levis. Some of the tumbles he underwent would have done credit to any star variety performer, and great amusement was caused by a certain photographer imploring Milner to come a cropper to oblige for a good snapshot, which he instantly did! The events were run off with great promptitude, and there were no irritating delays, with the result that the meeting was concluded soon after six-thirty. Events terminated with an "old crocks" race, open to machines built previous to the end of 1907. This was won by J. H. Priddey on a 3 h.p. Rex

Mr L. W. Spencer climbing a gradient of 1 in 2·7 to the summit of Dunkerry Beacon, 1707ft. above sea level.

DEVON HILLS BEATEN BY A LIGHTWEIGHT.

A Triumph for the "Precision Junior" Power Unit.—Famous Test Hills climbed.

FOR thoroughly testing the powers of a motor cycle there is nothing like a trip from London to Devon. There is a 200 mile journey down, and when you get there a splendid series of hills on which to try the hill-climbing powers of the machine. For this purpose indeed Devon is the finest county in the British Isles.

Mr. L. W. Spencer has put a "Little Giant" Motorcyclette fitted with the "Precision Junior" Unit through this strenuous test, and writes most enthusiastically of the result. The journey down through Gloucester and Bristol was performed, of course, with ease, and the first hill of any consequence—Porlock—was covered without a falter. Lynton Hill was next attacked, and the little machine made an unhesitating non-stop climb. Of the next ascents Mr. Spencer writes as follows:

"The next climb was Station Hill, Lynton, the precipitous road to Lynton Railway Station. Station Hill is really in a class by itself. Its commencement is covered from side to side with deep loose macadam, and the surface from top to bottom is abominably loose. To almost any ordinary motor cycle it is practically unridable, and I do not believe it has been climbed half-a-dozen times in its history. The lightness, however, of my machine made all the difference; for it seemed to just skim over the stones on its way to the top, which was quite easily reached without trouble or hesitation. I have never seen people so amazed at a hill-climbing feat as a number of onlookers were at the way the machine took this hill. They were astounded at the way the machine pulled.

"We next made for Beggar's Roost, where so many motoring reputations have been lost. It is certainly one of the worst of the Devon test hills, and on more than one occasion have I had to retrace my steps from its precipitous gradient on various makes of motors. But not so to-day. The monotonous ease with which the hill was climbed seemed ridiculous. We found it was simply necessary to push the bike across the road for it to start anywhere on the hill—a truly wonderful performance.

"As I was particularly anxious to try the little machine on some really tough work more of a Colonial character, we made a trip to Dunkerry Beacon. The path leading to the summit is a mere boulder-strewn heather track. I had ridden it a few years ago on a 3½, but what had then been an ordeal became on the motorcyclette the simplest of rides. With the engine just ticking over and one's feet on the footboards it was possible to steer the machine in perfect comfort over the roughest parts of the track. The path concludes by surmounting the mount which forms the Beacon, at which the gradient is probably 1 in 2. It certainly seemed to tax the power of the machine more than any other hill, and I just succeeded in going straight up it to the foot of the cairn. The ease and handiness of the motorcyclette on this little excursion finally proved to me what the Snowdon climb had already demonstrated, that it is the ideal machine for really rough work, and its possibilities for Colonial work are tremendous."

It should be remembered that the "Little Giant" which came so splendidly through this exacting test was an ordinary machine with standard gears. The whole machine is so light that it can be lifted. Its appearance is extremely neat —"clean cut"—the frame is specially strong. Because of its lightness it skims through snow and slush and gets over rough roads with ease. There are four models—two for gentlemen and two for ladies. An ordinary belt-driven model at 25 guineas (a similar model for ladies at 26 guineas), and a special chain-driven model, with girder forks, 2in. tyres, and all necessary equipment at £30 (for gents) and 30 guineas (for ladies).

Enquiries, especially from agents, are invited. They should be addressed to The Little Giant Motorcyclette Co., 101, High Street, Uxbridge, Middlesex. (Telephone: 184 Uxbridge.)

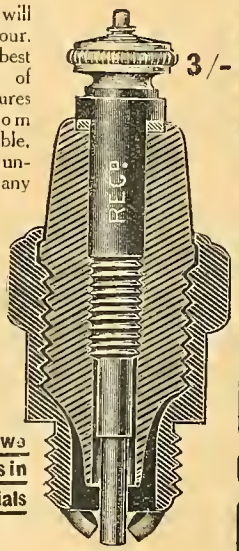
TYPE C.

and no trouble will spoil your tour. They are the best by far, and of quality that ensures freedom from anxiety, trouble, and mileage unattainable with any other make.

Forward Type C the Gold Medal Plug.



SECTION.

Read what Two Medal Winners in the Scottish Trials write.

DEAR SIRS, CRICKLEWOOD.

I have much pleasure in informing you that I have gained a Gold Medal in the Scottish Six Days Trial, using your Fasteners and Plug, which both gave every satisfaction.

H. F. EDWARDS.

GENTS, SHEFFIELD.

You will be pleased to hear I got through the Scottish Six Days Trial without loss of any marks. I climbed all test hills and gained all bonus marks. The Fasteners never failed me once, and we had some very severe climbs indeed. The Plugs gave me every satisfaction, and I will do my best and recommend to all I meet. I also made a non-stop in the M.C.C. Trials the Saturday before, my total mileage for the 7 days being about 1,500 miles.

S. SAWER

Speed Trial in the Midlands.—

of 425 c.c., which "legged it" in fine style, and covered the five hundred yards in 27⅗ seconds.

Quite a number of machines call for favourable comment by reason of their capital displays. A 2¾ h.p. Diamond, ridden by H. S. Greatwich, ran exceedingly well, and annexed the class up to 350 c.c., being first on both time and formula. The design of this machine is most pleasing, and its powers of acceleration admirable. Braid's 3½ Norton also showed a fine turn of speed, and throughout the afternoon the various 3½ h.p. James machines ran wonderfully consistently.

In conclusion, a word of praise should be given to the various officials, who worked throughout most expeditiously, and to the timekeepers for the very prompt announcements of the formula results.

Results of the Racing.

CLASS I.—Single-cylinder Motor Cycles not exceeding 200 c.c. Experts barred. On time.—1, A. Milner (1¾ Levis), 27⅘s.; 2, B. Norris (2 O.K.), 28⅗s.; 3, G. Strange (2 O.K.), 28⅘s. On formula the results were the same.

CLASS II.—Solo Machines over 200 c.c. and up to 350 c.c. Experts barred.—1, H. S. Greatwich (2¾ Diamond), 20s.; 2, H. Hanks (3 Enfield), 21⅕s.; 3, H. Greaves (3 Enfield), 22s. The winner's speed was 51.2 m.p.h. On formula the results were the same.

CLASS III.—Solo Machines over 350 c.c. and up to 500 c.c.—Experts: 1, C. R. Collier (3½ Matchless), 18⅗s.; 2, H. V. Colver (3½ Matchless), 18⅘s.; 3, A. Pollock (2¾ Precision), 19⅗s. Speed 55.6 m.p.h. Collier was also first on formula. General: 1, R. J. P. Braid (3½ Norton), 19⅘s.; 2, E. Smith (3½ Regal), 20⅘s.; 3, A. Pollock (3½ Precision), 20⅗s. Speed 51.65 m.p.h. On formula L. Hadley (3 Enfield) was the winner.

CLASS V.—Solo Machines over 500 c.c. and up to 750 c.c.—1, E. Hopkins (5 Abingdon), 19⅘s.; 2, H. Jephson (6 Zenith), 20⅗s.; 3, L. Edkins (6 Ivy-Jap), 21⅘s. Speed 52.7 m.p.h. On formula Hopkins was also the winner.

CLASS VII.—Solo Machines over 775 c.c.—1, A. McKenzie Cott (8 Ivy-Jap), 18⅗s.; 2, G. T. Walker (7 Indian), 19⅘s. Speed 55.6 m.p.h. On formula McKenzie Cott was also the winner.

CLASS IX.—Racing Machines up to 500 c.c.—C. R. Collier (3½ Matchless), J. W. Draper (3½ Triumph), and H. Riddell (3½ Precision) all tied with 18½s. On the run-off Collier won in 18s., Draper being second in 18⅕s., and Riddell third in 18⅘s. Speed 56.9 m.p.h.

CLASS X.—Racing Machines over 500 c.c.—1, A. J. Brewin (8 Zenith), 16⅘s.; 2, C. R. Collier (7 Matchless-M.A.G.), 17⅕s.; 3, Harry Reed (8 Dot), 17⅗s. Speed 62.4 m.p.h.

CLASS XI.—Sidecars up to 350 c.c.—1, H. S. Greatwich (2¾ Diamond), 25⅕s.; 2, E. V. Pratt (2¾ Calthorpe), 28⅗s.; 3, J. J. Woodgate (2¾ V.T.S.), 31⅕s. On formula Greatwich was also the winner.

CLASS XII.—Sidecars over 350 c.c. and up to 500 c.c.—1, K. Holden (3½ B.S.A.), 24⅗s.; 2, J. L. Norton (3½ Norton), 25⅘s.; 3, F. R. Banks (3½ Regal-Green), 25⅕s. On formula Holden was also the winner.

CLASS XIII.—Sidecars over 500 c.c. and up to 750 c.c.—1, H. Jephson (6 Zenith), 25⅕s.; 2, E. Smith (4 Regal), 25⅗s.; 3, H. J. Cox (6 A.J.S.), 25⅗s. On formula the winner was T. Pollock (3½ James).

CLASS XIV.—Sidecars over 775 c.c.—1, H. Jephson (8 Zenith), 20s.; 2, A. J. Brewin (8 Zenith), 20⅕s.; 3, J. W. Woodhouse (7-9 Quadrant), 22⅕s. On formula Jephson was also the winner.

CLASS XVI.—Any Solo Machine.—1, C. R. Collier (7 Matchless-M.A.G.), 16⅕s.; 2, A. J. Brewin (8 Zenith), 16⅗s.; 3, Harry Reed (8 Dot), 17⅗s. Speed 63.2 m.p.h. On formula the winner was J. W. Draper (3½ Triumph).

CLASS XVII.—Any Solo Machine. Novices only.—1, G. F. Hasler (8 J.A.P.), 17⅗s.; 2, J. W. Draper (3½ Triumph), 18s.; 3, S. King-Smith (6 Bat), 19s. On formula the winner was J. W. Draper.

CLASS XVIII.—Old Crocks. For machines built previously to December 31st, 1907.—1, J. H. Priddey (3 Rex), 27⅗s.; 2, C. S. Madeley (3 Triumph), 30⅗s.; 3, T. Silver (2 Quadrant), 31⅕s. On formula Priddey was also the winner.

Open 24 Hours Trial in Ireland.

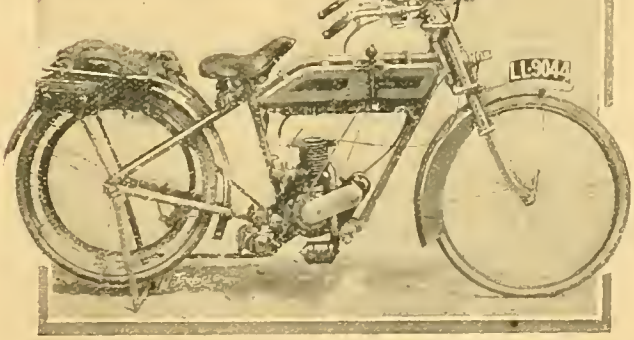
THIS important event took place on Friday and Saturday last, and, as usual, there were a number of English competitors in the field of forty-one riders who left Dublin at eight o'clock on Friday evening. Hugh Gibson was taking part for the third time, but on this occasion he was on a 2¼ Clyno. S. A. Rowlandson, of the Rudge Co., and R. B. Ewens, Coventry (3½ Rudge), were among the English riders, the former being one of those who successfully completed the trial, but Ewens failed on Glengesh Hill. Tassell and Guest, of London, on 7 Matchless sidecars, were also amongst those who made clean ascents of this hill and also had no-trouble runs.

The weather conditions were delightful at the start, and there was nothing but the dust to bother the men on the first section of 101 miles to Belfast. The official control was at Dunleer (37 miles), and practically all the field were on time there. Some distance further on—at Newry—A. W. Mooney, who won the event last year, broke the connecting rod of his 6 Bradbury sc. and had to retire. Belfast was reached in the early hours of the morning. The arrangements made by the police to pilot the riders in and out of the city were greatly appreciated.

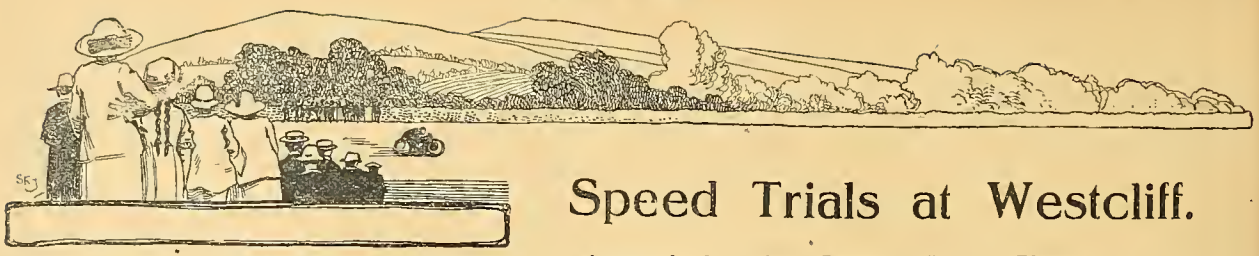
The early morning journey included the crossing of the Spern Mountains between Maghera and Dungiven, this being a non-stop section. There was a little rain encountered on this part of the journey, but it was nothing serious, and it had cleared away before Londonderry was reached for breakfast. Quite a number of men had already fallen by the way, and by the time Glengesh Hill was reached J. D. Weir (5-6 A.J.S. sc.) was in trouble, as also were J. Clarke (Rudge), R. Chambers (3½ Bradbury), P. A. Bell (3½ Triumph), who sustained a bad fall, L. Dobbin (7 Matchless sc.), and R. S. Russell (7 Matchless sc.).

The Severest Hill in the Trial.

Glengesh Hill was the chief point of interest, as it is generally regarded as the most severe hill to be found on any main road in Ireland. It lies between Ardara and Carrick, and its rise of 900ft. is spread over five miles, but as 600ft. of the rise comes into the last mile there are numerous hairpin bends to be negotiated. Failure to make a clean ascent of the hill practically put a competitor out of the trial. All but one of the English competitors got up; but, generally speaking, the climbing was not very good. Many notable riders, including T. E. Greene, failed to make clean ascents, and out of the forty-one competitors only fifteen secured full marks for the climb. Their names are as follow: J. Browne (3½ Rover), R. Walsh (3½ Rover), J. Doleman (3½ Rover), S. A. Rowlandson (3½ Rudge), R. E Guest (7 Matchless sc.), P. J. Cox (3½ Douglas), C. S. Hosford (3½ Rover), P. J. Brady (3½ Rudge), W. H. Freeman (7 Indian), W. J. Henderson (5-6 Rudge), R. B. Ewens (3½ Rudge), T. L. Dooly (3½ Zenith), J. Tassell (7 Matchless sc.), G. Haynes (2¾ Douglas), T. E. Greene (3½ Rudge), P. Grimes (3½ Rover), V. J. Farrell (4 Triumph), Hugh Gibson (2¼ Clyno), E. G. Jack (3½ Rover), G. Roche (3½ Rover), R. Armstrong (6 Enfield sc.), Jack Healy (6 Enfield sc.), S. Allen (7 N.S.U. sc.), W. J. O'Callaghan (8 Humberette), J. F. A. Day (2½ Sun-Villiers), J. Holland (8.5 Perry c.c.)



The two-stroke Dayton, which is fitted with two-speed counter-shaft gear, chain and belt drive, and 162 c.c. engine. This machine performed very creditably in the recent Sutton Coldfield and Mid-Warwickshire A.C. open trial for miniature motor cycles.



Speed Trials at Westcliff.

Enormous Programme run through by the Essex Motor Club.

BEAUTIFUL weather favoured the Essex Motor Club's open speed trials which were held on the promenade, Westcliff-on-Sea, on 25th June. The surface of the course was good, but not in the super-excellent condition which is to be found on the front at Brighton, and it had a slight bend in it at the beginning. The start was at the Westcliff end of the promenade, and as the events were run in a westerly direction, the gentle summer breeze was an aid to the riders. The motor cycles entered were 226 in number, the cars numbered 82, making a record entry of 308. A large crowd witnessed the events, but as, unfortunately, no provision was made for posting the times very few persons had any idea as to what was going on. A serious mistake was made in placing the paddock somewhere near the middle of the track, which caused some delay at the start, since the marshals would not let the men through the barrier, and in consequence several lost their turn. There was plenty of room behind the starting line for quite a number to have been drawn up in their numerical order, and eventually this was done, but not before a considerable time had elapsed. As the men were timed over various distances there were three finishing lines, and some confusion was caused by men stopping at the wrong line. This fault could have been easily overcome by marking the line in use by means of flags. The way back to the start was complicated, and was supposed to have been marked by arrows, but it was reported to us that some of the arrows were missing and that several of the men lost their way. We are sorry to have to make these criticisms, but we do so only to drive home the fact to the organisers of competitions for which a gigantic number of entries have been received that more than usual care must be taken to make such meetings a success. The members of the Essex Motor Club are full of keenness and enthusiasm, and they quickly saw their errors and hastened to set right those which could be corrected on the spot. By the superhuman efforts of Messrs. S. G. Cummings, D. S. Kapadia, W. Cooper, A. R. Abbott, and others, the confusion at the start was soon restored to something approaching order, while the secretary of the meeting, Mr. E. J. Bass, worked like a hero.

Few of the competing machines possessed any novel or interesting features, but we noticed that Stockdale's Triumph was fitted with a Binks carburetter to which he had added two hot air pipes, one of which led to a position behind the jet, and the other to the cylinder. Reed's Dot was fitted with auxiliary exhaust ports, which, however, were stopped up with waste, and a very well-designed heel-operated foot brake. Axford was riding one of the new Matchless M.A.G. engined machines, which proved exceedingly fast, while Busby's 2¾ h.p. Sunbeam was on several

Scene during the running of the solo machines not exceeding 1,000 c.c. (experts). V. Busby (3½ h.p. Sunbeam) is seen in the foreground. The ultimate winner was H. Reed (Dot), who is lying third.

Start for the flying kilometre in the 500 c.c. class. The promenade at Westcliff is so wide that four riders can easily race abreast

NEW MODEL

The Latest and Best in Motor Cycle Speed Indicators

Stewart

MOTOR CYCLE SPEEDOMETER

HERE is another Stewart triumph—a Speedometer for Motor Cycles infinitely superior to anything hitherto achieved for the purpose. It is a grand instrument — accurate, easy to read, and absolutely reliable. You couldn't wish for anything better. This new model is of the sturdiest construction, and, bar accidents, will give years of satisfactory service. It is Stewart quality through and through; made of the same costly materials and on the same costly principle as Stewart Car Speedometers.

And the price is £3-3-0. We can sell so low because we make so many. The Stewart Speedometer Output is over 2,000 instruments daily, with an ever-increasing demand.

Why not have this new Stewart Model on your Motor Cycle? It costs so little and gives so much that you'll be delighted with the purchase. Registers from Zero to 75 miles per hour; records up to 10,000 miles and repeats; has trip register which can be rapidly reset at any time.

Dunhills

359-361, EUSTON ROAD, LONDON, N.W.

City Branch: 42-43, Lombard Street, E.C.

MANCHESTER: 88, Cross Street. **GLASGOW: 72, St. Vincent Street.**

In answering this advertisement it is desirable to mention "The Motor Cycle"

Speed Trials at Westcliff-on-Sea.—

occasions more than a match for larger machines. It was interesting to note that he used his clutch for getting away, a method not often employed in racing, but used several times during this meeting. The first event was noticeable owing to the fact that there were two lady entrants—Mrs. Fletcher and Miss Ellis.

Results of the Racing.

EVENT 1 (General). CLASS I.—Standard Touring Machines not exceeding 350 c.c., 1 km. standing start.—This event resulted in an easy win for H.A. Rhodes (2¾ A.J.S.), time 47s.; while Mrs. Fletcher (2¾ Douglas) was second, time 52⅘s.

EVENT 2 (General). CLASS XX.—Any Passenger Machine not exceeding 1,100 c.c., 1 km. flying start.—J. Chater-Lea (8 Chater-Lea sc.); a walk-over; time 48⅖s.

EVENT 3 (Expert). CLASS II.—Standard Touring Machines not exceeding 500 c.c., 1 km. standing start.—The result was an easy win for V. Busby (2¾ Sunbeam), time 43s.; who beat L. G. Brown (3½ Zenith), time 45s. Busby got away in first-class style.

EVENT 4 (General). CLASS X.—Any Solo Machine not exceeding 375 c.c., 1 km. flying start.—1, B. Pattison (1¾ Zenith), time 43⅘s.; 2, J. Simpson (2½ Hobart), time 51s.

EVENT 5. CLASS IV.—Standard Touring Machines not exceeding 1,000 c.c., 1 km. standing start.—1, L. P. Openshaw (8 Zenith), time 41⅕s.

EVENT 6 (Expert). CLASS I.—Standard Touring Machines not exceeding 350 c.c., 1 km. standing start.—1, H. A. Rhodes (2¾ A.J.S.), time 43⅘s.

EVENT 8 (General). CLASS II.—Standard Touring Machines not exceeding 500 c.c., 1 km. standing start.—In one of the heats that plucky rider, F. W. Applebee, sen. (Motosacoche), accelerated in excellent form, and went off gaily with a cigarette behind his ear. Result: 1, H. Le Vack (3½ Motosacoche), time 41⅘s.; 2, A. H. Bird (3½ Rover), time 45⅖s.; 3, G. L. Fletcher (2¾ Douglas), time 46⅕s.

EVENT 9 (Expert).—Standard Touring Machines not exceeding 750 c.c., 1 km. standing start.—1, R. Charlesworth (5 Zenith), time 48⅘s.; 2, A. J. Dixon (3½ Singer), time 48⅘s. Dixon had unfortunately had trouble with the big-end bearing on the way to the start, but despite the condition of the engine he managed to be only one-fifth of a second behind his rival.

EVENT 11 (General). CLASS III.—Standard Touring Machines not exceeding 750 c.c., 1 km. standing start.—1, H. R. Whitmore (3½ Lea-Francis), time 46s.

EVENT 14 (General). Standard Touring Machines not exceeding 1,000 c.c.—1, L. Openshaw (8 Zenith).

EVENT 15 (General). CLASS I.—Standard Touring Machines not exceeding 350 c.c., 1 km. flying start.—1, H. A. Rhodes (2¾ A.J.S.), time 55⅖s.; 2, R. D. Bennett (2¾ Douglas), time 57s.; 3, Miss N. Ellis, time 58s.

EVENT 16 (Expert). CLASS II.—Standard Touring Machines not exceeding 500 c.c., 1 km. flying start.—1, V. Busby (3½ Sunbeam), time 36⅖s.; 2, C. G. Pullin (3½ Rudge), time 37s.

EVENT 17 (Expert). CLASS IV.—Standard Touring Machines not exceeding 1,000 c.c., 1 km. flying start.—1, L. P. Openshaw (8 Zenith), time 34⅘s.

EVENT 18 (Expert). CLASS I.—Standard Touring Machines not exceeding 350 c.c., 1 km. flying start.—1, V. Busby (2¾ Sunbeam), time 37s.; 2, H. A. Rhodes (2¾ A.J.S.), time 47⅖s.; 3, G. L. Fletcher (2¾ Douglas), time 47⅕s.

EVENT 19 (Expert). CLASS III.—Standard Touring Machines not exceeding 750 c.c., 1 km. flying start.—1, C. G. Pullin (3½ Rudge), time 35⅕s.; 2, A. J. Dixon (3½ Singer), time 35⅘s. It is interesting to note that Dixon, despite the defect in his engine, was only ⅖s. behind Pullin.

EVENT 20 (General). CLASS II.—Standard Touring Machines not exceeding 500 c.c.—1, P. L. Emery (3½ Norton), time 34s. (winner of prize offered by the Palmer Tyre Co., Ltd.); 2, L. G. Brown (3½ Zenith-Jap), time 35⅕s.; 3, J. A. Campbell (3½ J.A.C.-Precision), time 37⅖s.

EVENT 21 (General). CLASS IV.—Standard Touring Machines not exceeding 1,000 c.c., 1 km. flying start.—1, C. R. Taylor (8 Zenith), time 30s.

EVENT 22 (General). CLASS III.—Standard Touring Machines not exceeding 750 c.c., 1 km. flying start.—1, H. T. Wollen (3½ Triumph), time 41s.

EVENT 25 (Expert). CLASS VI.—Touring Sidecar Machines not exceeding 750 c.c., 1 km. standing start.—Owing to his recent accident while piloting H.M. Queen Alexandra from Walton to Weybridge, F. W. Barnes was not able to ride, and his place was taken by a rider named Jepson, who had a walk-over.

EVENT 27 (General and Expert). CLASS V.—Touring Sidecar Machines not exceeding 500 c.c., 1 km. flying start.—1, C. G. Pullin (expert, 3½ Rudge), time 41⅖s.

EVENT 28 (Expert). CLASS VI.—Touring Sidecar Machines not exceeding 750 c.c., 1 km. flying start.—1, J. Triniman (3½ Rudge), 41⅕s.

EVENT 30 (General). CLASS VII.—Touring Sidecar Machines not exceeding 1,000 c.c., 1 km. standing start.—1, A. J. Macdonald (6 New Hudson), time 61⅖s.

EVENT 31 (General). CLASS 6.—Touring Sidecar Machines not exceeding 750 c.c., 1 km. standing start.—1, J. H. Triniman (6 Bradbury), 60⅖s.

EVENT 33 (General and Expert). CLASS 10.—Any Solo Machine not exceeding 275 c.c., 1 km. standing start.—1, W. A. Jacobs (expert, 1½ Singer); 2, B. Pattison (1¾ Zenith).

EVENT 35 (Expert). CLASS 7.—Touring Sidecar Machines not exceeding 1,000 c.c., 1 km. standing start.—1, L. P. Openshaw (8 Zenith), time 45⅕s.

EVENT 36 (Expert). CLASS X.—Any Solo Machine not exceeding 275 c.c., 1 km. flying start.—1, W. A. Jacobs (1½ Singer, expert); 2, J. Simpson (2 Hobart, general), time 51⅖s.

EVENT 38 (General). CLASS VII.—Touring Sidecar Machines not exceeding 1,000 c.c., 1 km. flying start.—1, C. R. Taylor (8 Zenith,) time 39s.; 2, L. P. Openshaw (8 Zenith), time 40⅕s.; 3, T. A. Carter (8 Hazel-Jap), time 42⅖s.

EVENT 40 (General). Any Solo Machine not exceeding 350 c.c., 1 km. standing start.—1, H. A. Rhodes (3½ A.J.S.), time 48⅕s.; 2, M. G. W. Burton (2¾ Imperial-Jap), time 50⅕s.

EVENT 42 (Expert). CLASS XII.—Any Solo Machine not exceeding 500 c.c., 1 km. standing start.—1, S. R. Axford (3½ Matchless), time 39⅕s.; 2, A. J. Dixon (3½ Singer), time 43⅖s. Axford's acceleration at the start created much commeat.

EVENT 44 (Expert). Any Solo Machine not exceeding 350 c.c., 1 km. standing start.—1, V. Busby (2¾ Sunbeam), time 44⅕s.; 2, J. P. Le Grand (2½ Singer), time 47⅖s.

EVENT 45 (General). CLASS XII.—Any Solo Machine not exceeding 500 c.c., 1 km. standing start.—1, T. M. McKenna (3½ Norton), time 40⅖s.; 2, W. H. Herrtage (Rudge Multi), time 44s.; 3, J. A. Campbell (3½ J.A.C.-Precision), time 44⅕s.

EVENT 46 (General and Expert). Any Three-wheeler Cycle Car not exceeding 1,000 c.c., 1 km. standing start.—1, E. B. Ware (Jap-Morgan), walk-over.

EVENT 47 (General). CLASS XI.—Any Solo Machine not exceeding 350 c.c., 1 km. flying start.—1, H. A. Rhodes (2¾ A.J.S.), time 37⅖s. (winner of Peter Union Tyre Co.'s prize); 2, A. H. Firmin (2¾ N.U.T.), time 42⅕s.; 3, M. G. W. Burton (2¾ Imperial-Jap), time 43s.

EVENT 48 (Expert). CLASS XII.—Any Solo Machine not exceeding 500 c.c., 1 km. flying start.—1, S. R. Axford (3½ Matchless), time 29⅕s.; 2, T. M. McKenna (3½ Norton), time 32s.; 3, C. G. Pullin (3½ Rudge), time 32⅖s.

EVENT 50 (General). CLASS XII.—Any Solo Machine not exceeding 500 c.c., 1 km. flying start.—1, T. M. McKenna (3½ Norton), time 31⅕s.; 2, J. A. Campbell (3½ J.A.C.-Precision), time 32⅕s.; 3, L. G. Brown (3½ Zenith), time 35⅕s.

EVENT 51 (Expert). CLASS XI.—Any Solo Machine not exceeding 350 c.c., 1 km. flying start.—1, V. Busby (2¾ Sunbeam), time 24⅕s.; 2, J. P. Le Grand (2½ Singer), time 35⅕s.; 3, G. L. Fletcher (2¾ Douglas), time 46⅕s.

EVENT 52 (General and Expert). CLASS XIII.—Any Solo Machine not exceeding 750 c.c., 1 km. standing start.—1, S. R. Axford (expert, 3½ Matchless), time 38⅖s.; 2, T. M. McKenna (3½ Norton), time 41⅕s.

EVENT 54 (Expert). CLASS XIII.—Any Solo Machine not exceeding 750 c.c., 1 km. flying start.—1, S. R. Axford (3½ Matchless), time 30s.; 2, C. G. Pullin (3½ Rudge), time 33⅕s.; 3, A. J. Dixon (3½ Singer), time 38⅖s.

EVENT 55 (General). CLASS XIII.—Any Solo Machine not exceeding 750 c.c., 1 km. flying start.—1, C. F. A. Portal (5 Bat), time 37⅕s.; 2, W. H. Herrtage (3½ Rudge), time 37⅖s.

EVENT 56 (General). CLASS XIV.—Any Solo Machine not exceeding 1,000 c.c., 1 km. standing start.—1, S. J. Malcolm (Indian).

EVENT 57 (Expert). CLASS XIV.—Any Solo Machine not exceeding 1,000 c.c., 1 km. standing start.—1, H. Reed (8 Dot), time 37⅕s.; 2, S. R. Axford (3½ Matchless), time 38s.

EVENT 59 (General). CLASS XIV.—Any Solo Machine not exceeding 1,000 c.c., 1 km. flying start.—1, E. C. E. Baragwanath (8 Matchless), time 29⅕s. (cup presented by Dobson and Co.); 2, J. C. Brook (7 Indian), time 30s.; 3, S. J. Malcolm (7 Indian), time 32⅕s.

EVENT 60 (Expert). CLASS XIV.—Any Solo Machine not exceeding 1,000 c.c., 1 km. flying start.—1, H. Reed (8 Dot), time 29⅖s.; 2, L. P. Openshaw (8 Zenith), time 32⅕s.; 3, A. O. K. Gilbey (3½ Sunbeam), time 37⅖s.

EVENT 62 (Expert and General). CLASS XVI.—Any Sidecar Machine not exceeding 750 c.c., 1 km. standing start.—1, J. Jepson (6 Zenith), time 50⅕s.; 2, J. H. Triniman (6 Bradbury), time 67⅕s.

EVENT 63 (General). CLASS XVII.—Any Sidecar Machine not exceeding 1,000 c.c., 1 km. standing start.—1, L. P. Openshaw (8 Zenith); 2, J. Chater-Lea (8 Chater-Lea).

EVENT 65 (Expert). CLASS XVII.—Any Sidecar Machine not exceeding 1,000 c.c., 1 km. standing start.—1, J. Jepson (8 Zenith), time 60⅕s.

EVENT 67 (Expert). CLASS XVI.—Any Sidecar Machine not exceeding 750 c.c., 1 km flying start.—1, C. G. Pullin (3½ Rudge), time 33⅕s.

EVENT 68 (General). CLASS XVII.—Any Sidecar Machine not exceeding 1,000 c.c., 1 km. flying start.—1, J. Chater-Lea (8 Chater-Lea sc.)

EVENT 69 (Expert). CLASS XVII.—Any Sidecar Machine not exceeding 1,000 c.c., 1 km. flying start.—1, L. P. Openshaw (8 Zenith), time 36⅕s.

EVENT 70 (Expert). CLASS XIX.—Any Three-wheel Cycle Car not exceeding 1,000 c.c., 1 km. flying start.—1, E. B. Ware (Morgan), time 38⅕s.

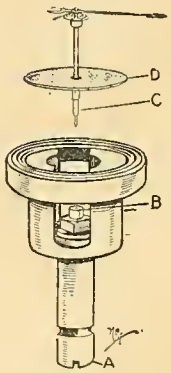
EVENT 72 (Expert).—Any Passenger Machine not exceeding 1,100 c.c., 1 km. flying start.—1, J. Jepson (8 Zenith), time 40⅕s.

The last event on the programme was a match between the fastest motor car and the fastest motor cycle over half a mile, flying start. This was won by H. Reed, who beat Easton's Schneider by two seconds at seventy-five miles an hour.

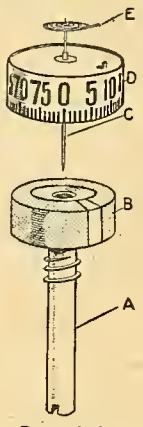
L. P. Openshaw (Zenith) winning the expert class for sidecar machines not exceeding 1,000 c.c.

Two New Speedometers.

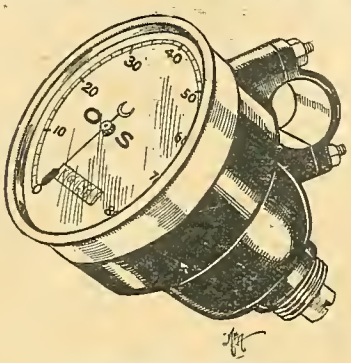
THE O.S. speedometer has been known for a long time in the motor car world, but it is only recently that the makers, whose London agents are at 18, King Street, St. James's, W., have introduced a motor cycle model. The accompanying sketch gives a diagrammatic view of the principle upon which the instrument works. The spindle A is connected to a flexible shaft driven by the usual spur gearing off the front wheel. The extension of this shaft is a magnet surrounded by a ring, and in the centre is a jewel bearing B, on which the spindle C carrying the indicator hand rests. On this spindle C is a copper disc D, which remains out of contact with the magnet. What are known as Foucault's currents bring about the working of the instrument. When the magnet B is rotated the lines of force crossing from pole to pole drag round the copper disc D in the direction of rotation of the magnet. The faster the magnet revolves the stronger the eddy currents become, and the farther is the needle carried up the scale. To prevent the copper plate tending to revolve with the magnet the spindle C is attached to one end of a hair spring, the other end of which is attached to a part of the body of the instrument so that the plate is only dragged round to a certain extent.



The O.S. speedometer operating mechanism.



Part of the internal mechanism of the Stewart speedometer.

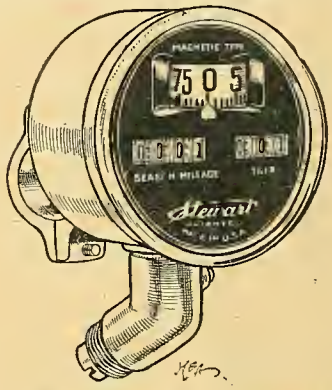


The complete O.S. speedometer.

The Stewart Speedometer.

A speedometer which works on the magneto principle and has met with much popularity among motor cyclists is the Stewart, which is sold in London by the Cooper-Stewart Engineering Co., Ltd., 11, Broad Street, Bloomsbury, W.C. It will be remembered that it previously showed the speed by means of an indicating hand. A much simpler method of showing the speed has, however, been discovered, and, referring to the drawing, which shows the working of the instrument, it will be seen that the speeds are inscribed upon the aluminium cup which covers the circular magnet. The principle of working is as follows: The spindle A is connected by means of a coupling to a flexible shaft driven by the usual type of gearing off the front wheel. At the top of the shaft is the circular magnet B, and on it is a bearing for the spindle C. When this spindle is placed in position the aluminium cup D covers the magnet. As the former is rotated the eddy currents set up tend to drag the aluminium cup round in the direction of rotation of the magnet against the tension of the hairspring E.

The Stewart speedometer is excellently made and has a very clear face, so that it can be read easily in the dusk; it is provided with a trip recorder and has a flexible shaft covered in leather.



The dial of the latest Stewart speedometer.

Tyres in Scottish Trials.

In the recent Scottish Six Days' Trials users of Dunlop tyres and belts were prominent in the prize list, capturing twenty-four gold, nine silver, and two bronze medals.

A Good Storm Coat.

On the occasion of a recent long distance trial we made use of an Oilsilkette coat, which was sent to us by the Rotary Jointing Company, Regent Street, Warrington. This coat proved to be most effective in keeping out the rain, and was found to be exceedingly light and altogether satisfactory.

An Interesting Booklet.

"About the Rudge Multi" is the title of an exceedingly interesting and well illustrated little book just produced by Messrs. Rudge-Whitworth, Ltd. It contains a large number of illustrations of the Rudge-Whitworth successes at home and abroad during the past year, both in trials and races, and a copy can be obtained on application to the firm.

British Successes in Holland.

In a recent motor cycle trial at Rotterdam we understand that Mr. Dyxhoorn, an amateur rider, was successful in winning a silver medal for the best performance on any model and a silver medal for the best sidecar performance on an 8 h.p. Rex-Jap and sidecar.

Reviews.

"Falmouth, Truro, and the River Fal." 6d. The Homeland Association, Ltd., Chandos Chambers, 15, Bedford Street, W.C. This is another addition to the popular Homeland Handbooks. Beautifully illustrated, well got up, and full of useful information, it is a wonderful sixpennyworth, which should be in the hands of all motor cyclists visiting this charming part of England.

"The Motor Routes of Germany." H. J. Hecht. A. and C. Blacks, Soho Square, W.C. Germany offers many attractions to the touring motor cyclist. The inhabitants are hospitable and kind for the most part, living is cheaper than in England, and there are many beautiful touring centres and quaint towns to be visited. Mr. Hecht's new book—which, by the way, is most artistically illustrated in colours—is practically indispensable to all who desire to visit the great German Empire on a motor vehicle. The author aims at no literary style, though the book is well written, but while he seeks to give only that information which the tourist cannot do without, he intersperses it with a sufficient number of historical details to render it interesting. All the principal touring centres—the Black Forest, the Taunus, the Thüringerwald, the Rhine, the Moselle, and Bavaria—are fully dealt with, while excellent route maps are given.

A New Grease Gun.

Messrs. A. R. Price, Vevo Works, Aston, Birmingham, are marketing an exceedingly neat nickel-plated grease gun. For motor cyclists whose machines are equipped with gear boxes fitted with a small filling orifice this gun should meet a long-felt want. It is absolutely simple, and consists of only two parts, so there is nothing whatever to go wrong.

Improved Method of Greasing.

An improvement on the prevailing style of oiling up has been effected by the Vacuum Oil Co. by means of their grease cartridge, recently introduced to the public. The cartridge, a cylindrical tin containing Mobilubricant for pressure cups or transmission grease for gear boxes, is fitted at the top with a screw, which regulates the delivery of the lubricant. The delivery may be fast or slow, according to the rate of winding, whilst the amount ejected is controlled by the size of the aperture, which is adjustable.

The tyre for speed.

The dome-like tread of a "Bates built" tyre offers the least possible resistance to the road with consequent maximum power efficiency. This means increased speed, and incidentally—longer tyre life.

Send for the Bates book, "Truth and Tyres," written by one who knows. It's full of useful "Do's and Don'ts" for motor cyclists.

Hermetic Works, BIRMINGHAM.

4,000 MORE MILES

ON A *BELDAM* RETREAD.

You can easily get 4,000 more miles on a Beldam Retread, as many customers have proved. Read the following, from a correspondent to "The Motor Cycle":

Sir,

When I first thought of having an old tyre re-treaded I went about seeking advice from other motor cyclists who had had experience. I was strongly advised not to try retreads as they were waste of money.

Seeing Beldam retreads advertised in *The Motor Cycle*, I decided to risk it, and sent the company a 26 × 2½ Hutchinson tyre that had done about 3,000 miles. When it came back I put it on my front wheel in October last, have run the whole winter using it practically every day, and it is good now for another 1,000 miles, and I have never had a puncture in it. This retread cost me 13s.

Now, I am not in the least interested in the Beldam Co., but only wish to point out to other motor cyclists who feel their tyre bill is a consideration that in this retread they have something good. VET.

Beldam Retreads, like Beldam Tyres, outlast all others.

Send tyres of any make to us for Repairs or Retreading—Beldam quality of materials and workmanship—Prompt delivery and subsequent satisfaction guaranteed—Estimate of cost by return.

The Beldam Tyre Co., Ltd.,
Brentford, Middlesex.

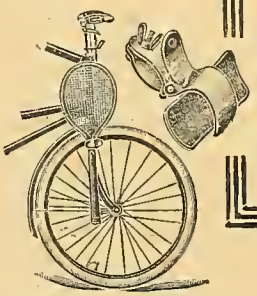
Terry's "Avecta" horn bulb clip. Prevents the horn bulb perishing and cracking by supporting it where weakest. Plated, **1/-** each. When ordering give size of fitting at bulb end.



No. 787. Tennis racket carrier, a reliable and easily fitted carrier. Plated finish, **2/-** set

No. 603. TERRY'S plated magneto spanner, **6d.** each.

Another New Record ESTABLISHED ON PRATT'S PERFECTION SPIRIT.

"The Life Force."

Mr. C. B. Franklin, on Indian motor cycle, set up new time for the 10 MILES RECORD (standing start, Class E) at speed average of 77.95 miles per hour. This grand performance on Pratt's Perfection Spirit, following on THE GREEN CAN'S achievements in the T.T. Senior and Junior Races and Light Car Trials, indisputably Prove PRATT'S SUPERIORITY.

Selfridge & Co., Ltd., Oxford Street, W.

Telephone: Gerrard, One. Telegrams: "Selfridge, London."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 0000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Son Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

The Trade and this Week's Trials.

THE reason for the abstention of several large firms from competing in the A.C.U. Six Days Trials which started from Sheffield on Monday morning, and which fact was pointed out in our columns last week, has caused a good deal of speculation. From observations we have made recently, the trade and the A.C.U. do not appear to see eye to eye on the question of the conduct and organisation of the more important trials. We believe it is a fact that the Manufacturers' Union would like to have more say in the framing of the regulations, they having to conform to them, and, therefore, knowing most of the weaknesses of trials conditions. One cannot dispute such reasoning, but we must say we think that the object of trials would be misconstrued if the trade framed conditions for events which they themselves supported. Last year, it will be remembered, there was a good deal of grumbling at the inclusion of freakish road surfaces and hills in the Six days Trials in the Lake District, and, moreover, the inclusion of watersplashes, which it is claimed in some quarters serve no useful purpose. It would appear at first sight that the manufacturers concerned have formed a compact among themselves to boycott the trial, but we have the authority of the secretary of the Manufacturers' Union in stating that the absence of seven important firms, viz., B.S.A., Rover, Rudge, Indian, Zenith, Rex, and F.N., is due entirely to their individual judgment.

One can only express regret that the grievances which exist could not have been smoothed over in order to render the trials fully representative, especially seeing that the A.C.U. Six Days event is among the most important annual fixtures, one which is looked forward to from year to year, and, moreover, has proved in the past a most useful guide to the prospective purchaser.

At the same time, it must not be imagined that the trial is unrepresentative on account of the firms in question having withheld their entries. It must unquestionably suffer prestige by reason of seven important firms holding aloof, but with 133 entries, largely composed of representatives of the trade, a successful trial is assured, and we express the hope that the differences existing may soon be adjusted, and no such deadlock occur again.

Pressed Steel Frames for Motor Cycles.

THE recent public appearance of pressed steel wheels on sidecars in the Scottish Trials opened up a new vista in motor cycle construction. Whether these wheels are superior at all points to wire wheels may possibly be a moot point; we know that steel wheels are easier to clean, the rims unlikely to dent, and spoke head troubles impossible, but they are not so light, at present at any rate, and resiliency is not, perhaps, so pronounced, but their future for severe work should be bright.

The question naturally arises, Why confine pressed and welded steel work to the wheels? A larger field than this lies before such craft, and in our opinion it must only be a question of time before the framework of motor cycles will be constructed on these lines. All brazing weaknesses could then be eliminated, crystallisation of the tubes practically banished, and probably considerable weight saved. It is instructive to cast an eye backward over automobile construction and watch the once almost universal tubular frame give way before the all conquering product of the steel pressers. Nowadays, pressed steel frames are so cheap and so exquisitely produced and the science of electrical welding has been brought to such a state of perfection that we really cannot see any insuperable difficulty in the way of such frames for motor cycles. In sidecar work in particular they should prove ideal. The only drawback that seriously presents itself is the fear that rigidity may be too pronounced, but in a measure that might be a blessing in disguise, as such a happening would inevitably hasten the universal adoption of rear sprung frames.

MACHINES ON THE ROAD.

An Appreciation of the 6 h.p. Bradbury and Sidecar.

"IT has been 3,000 miles by now without any looking after at all, so you will probably find it wants tuning up," we were told when we took over one of the new 6 h.p. Bradbury machines with sidecar—the first one that had been turned out, as a matter of fact.

Our informant was quite right; it did want tuning up. In fact, the following morning it flatly refused to start at all, but the trouble was merely due to the valve stems being stuck in their guides with excess of oil. The magneto contact breaker, also, wanted a little adjustment, and the cylinders were taken off and cleaned, and, finally, the engine and gear box were washed through with paraffin, provided with fresh oil, and the chains were adjusted. Attention to this last item disclosed another source of trouble, for the second gear would not engage nicely, and was prone to jump out of engagement. This was due to the gear box having been slightly shifted during the chain adjustment, with the result that it had altered its position relatively to the change speed lever. Two or three minutes, however, sufficed to turn the coupling and lock nut of the rod connecting this lever with the gear box striker, and so to shorten it: then the machine began to show its real quality.

A BRADBURY AND SIDECAR IN A WATER-SPLASH.

The passenger is wisely protecting herself with the useful cover apron which many makers supply as standard.

Traffic and Hill-climbing Tests.

For a first trial we turned into the Edgware Road, where among the traffic the machine showed itself eminently controllable. In fact, it ran so gently as to give no indication of its power, and it was only when the A.A. scout had been passed at the turning down to Stanmore, and we put the machine at Brockley Hill, that we began to realise that we had got something uncommonly good in the way of an engine. It was a Saturday afternoon, and the usual crowd of motor cyclists were carrying out a trial on Brockley Hill, but though some first-class machines were among them, the way the Bradbury came up on top all the way drew their attention; it was an eye-opener to them as well as to the driver of the machine. At Elstree we turned off, and put our little machine at Woodcock Hill, but that and Highwood Hill on top gear were, of course, foregone conclusions to a machine that could surmount Brockley in the way the Bradbury had done.

All-round Reliability.

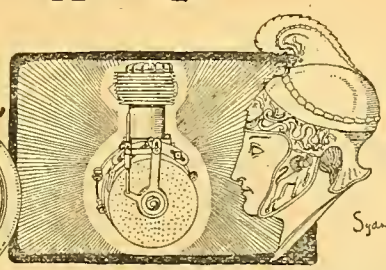
Our first trial run was only a sample of what the Bradbury habitually did for us every week-end for two or three months with great reliability. Wet or fine, over smooth or heavy roads, it seemed to make no difference, and it regularly took on top gear hills that had always forced the writer to drop into second on a far more powerful machine. And it was not a question of low gearing either, for on the level the Bradbury, although not abnormally fast, could show a good turn of speed—certainly something well over forty-five miles an hour. At such speeds, too, the riding was remarkably smooth and easy. In fact, at high speeds for rough roads it proved one of the most comfortable machines it has ever been our lot to ride, while the sidecar in no way fell behind in this respect. The steering, too, though sensitive, was extremely easy and light on the tyres. In fact, during the whole time we had the machine no suspicion of tyre trouble showed itself. The writer can honestly say that he has never driven a more satisfactory sidecar combination than the 1914 model 6 h.p. Bradbury with its twin-cylinder engine of 74½ × 86 mm. bore and stroke, and it says something for the confidence the makers have in their product that they left it in our hands for such a long period in order that it might undergo a thoroughly severe testing under all conditions.

A
'TWO-STROKE
AND LIGHTWEIGHT NUMBER.

Special articles and illustrations are in course of preparation for the "Two-stroke and Lightweight Number" of "The Motor Cycle," to be issued on THURSDAY, JULY 23rd.

OCCASIONAL COMMENTS

By 'IXION'

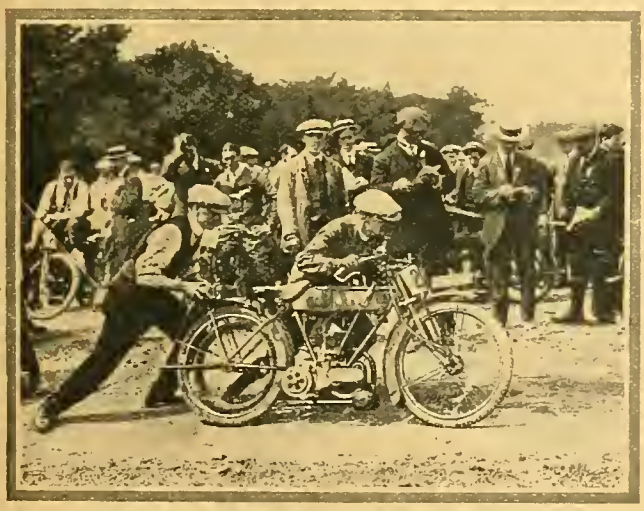


Chills on the Abdomen.

I have heard of several riders being laid up with internal chills after long night rides, and I fancy this rather serious complaint is due to foolish clothing. Many riders stuff themselves into a couple of coats, and pull a separate legging over each thigh, the legging terminating short of the groin. When they get in the saddle and begin scrapping against a chilly wind the front corners of both coats blow sideways, and the abdomen, where so many vital organs are massed, is left with no better protection than suffices for walking exercise. The waterproof trousers, which come right up to the waist in front, are windproof, and are much better wear than the separate leggings, though they are usually deficient in ventilation. A cholera belt is probably a wise provision, but has the disadvantage of remaining in position till the rider changes his clothes. A correspondent advises a square of glazed leather, safety-pinned to the lower part of the waistcoat, to hang down like an episcopal or masonic apron. At any rate, some protection is a sheer necessity in winter work and also at night.

Marking System in the Scottish Trials.

The Edinburgh M.C.C. introduced a novel marking system in their recent Six Days Trial. When a rider lost his *first* time or reliability marks, *i.e.*, by being late or early at a control, he was mulcted in a double penalty; primarily, he lost one mark for every minute by which he was late or early; secondly, he lost an Irishman's bonus of fifty extra marks because it was his first offence! The absurdity of the system is obvious from my phraseology. It is, however, easy to see how the organising committee fell into such a ridiculous pitfall. They had determined—quite legitimately and wisely—that nobody should receive a gold medal if he lost any time (*i.e.*, reliability) marks at all. Furthermore, they had resolved to take climbing power and finishing condition into account, so they framed another rule, which fixed a minimum marks total as qualifying for a gold medal; and to make this rule workable, they had to employ some system of exaggerating any small failure of reliability. Hence the Irishman's bonus for the first offence.



THE BIRMINGHAM M.C.C. SPEED TRIALS.

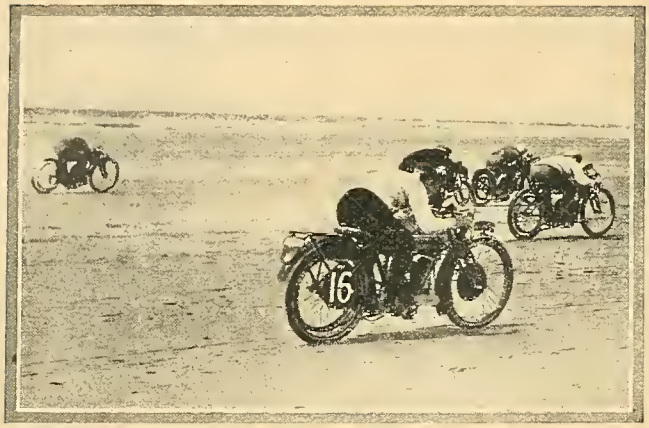
J. J. Woodgate starting in Class II. on a new two-stroke machine of his own make, known as the V.T.S.

Stupidity and Bad Luck.

I think their plan is mistaken, because Trials exist to give the public information; and, as any veteran journalist knows, the public are incapable of assimilating information unless it is given in a very lucid form indeed. The public will never realise that some unfortunate competitor who lost fifty-one marks in the Scottish Trials was guilty of no worse crime than being a minute early at a control, owing possibly to a discrepancy between watches, which the judges may refuse to admit on appeal. (As every experienced competition rider is aware, protests and appeals receive rather short shrift in big trials, because all the riders are out to do the best they can for the reputations of their machines and themselves, and judges who turn a tender ear to one protest are immediately bombarded with a score of frivolous appeals.)

Harsh Working of the Rule.

However, let us cite a few instances which *The Motor Cycle* representative noted with some commiseration. Haddock, I hear, got shut in behind a car on a short control where the road was so narrow he could not pass for several miles. The cycle cars were running to a more liberal time margin than the motor cycles; he was 1m. late at the next check, and lost 51 marks. Selby, through a discrepancy of watches, checked in a minute early at one control, and lost 51 marks. Davenport reached the finish of the trial half an hour ahead of time, and spent the interval prior to checking in in cleaning his machine (just as all the other riders employed similar intervals). During his labours his watch stopped; as a consequence he checked in 5m. late, and lost 55 marks. Whether these men (and the manufacturers who make their machines) should suffer any loss of awards or reputations for such trivial reasons may be an open question. The A.C.U. used to ignore time mistakes up to three minutes per check; but, *if a trial exists to provide the public with lucid, accurate, and reliable information about the different types of motor bicycle*, it is obviously absurd that a machine should lose more than 25% of the total marks for the week because some trumpery little accident robs it of one, two, or even five minutes at one out of thirty or forty checks.



A NATURAL SPEED TRACK.

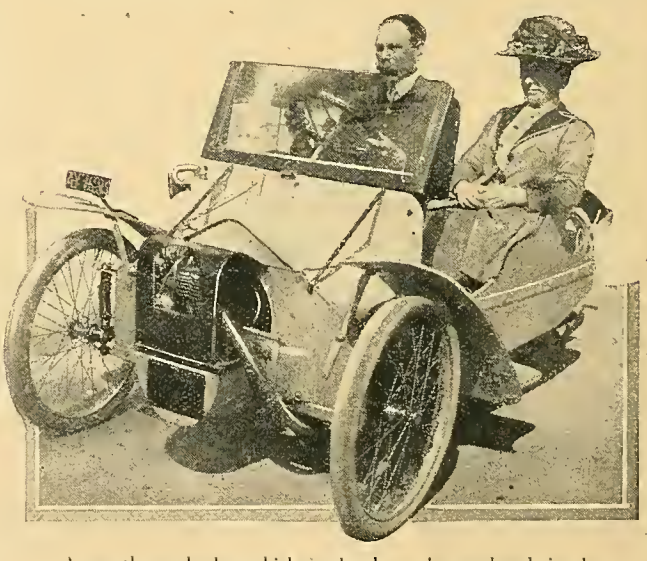
Racing on the sands at popular seaside resorts has lately been favoured.

Automatic Carburation.

I return to an old subject in a less sanguine spirit than usual. A cycle car which I have been driving lately is ornamented with a carburetter possessed of a deservedly high reputation amongst the automatic one-lever variety. When I first handled it I was fresh from rather a sensitive sample of the two-lever type, and it positively enchanted me. The engine would tick over almost inaudibly at an absurdly low number of revolutions, and when I opened the single lever it accelerated without choking into a stupendous blur of sound. The paces ranged from 5 to 50 m.p.h. on the flat, and the consumption of 30-35 miles per gallon at 27 m.p.h. averages was not disgraceful for a vehicle which is a bit of a hypocrite under a 7 cwt. limitation. But the more I learn of this vehicle the more I regard its carburetter with awe. There is an insignificant air adjustment on the carburetter; of course, it has no separate lever—otherwise the contraption would obviously cease to be "automatic." But if I open this wee air lever the merest thought, things begin to happen. For one thing the engine will no longer run slowly; I do not say that it creates as much pother and fuss on minimum throttle as a motor cycle V twin engine would, but its running becomes neither silent nor slow. Moreover, the engine cannot be started with this plate open to one-fifth of its maximum orifice. Furthermore, the acceleration is enormously improved by the extra air. Finally, the consumption improves at least 10%. These facts show that users of this alleged "automatic" vaporiser pay a very high price indeed for their automaticity. They sacrifice several very important advantages in the sole interests of that stationary tick-tick-tick; and you can only combine all the merits of the carburetter by opening the bonnet and moving the plate whenever the engine is started up, and re-opening the bonnet to close the plate when the engine is stopped.

"Whew!——"

Alternative cross-heading—"the Ford outforded!" My latest American mail contains particulars of a new cycle car de luxe designed by C. F. Herreshoff, better known "this side" in connection with racing yachts. The specification includes a four-cylinder water-cooled engine, dimensioned at 65 mm. × 82 mm., hand lever starter from the driving seat, three-speed gear box, propeller-shaft drive with two universal joints, 3in. tyres, worm and sector steering, cantilever springing, hood, wind screen, electric hooter, electric lighting (head lights provided with "dimmers," too!), and a speed range of 2-50 m.p.h. The price is 500 dollars, about £100; or half what a first-class British maker has to charge for a less luxurious specification. Again, I ejaculate "Whew!" No doubt the price contrast is partially explained by the workmanship, but beyond question some of the American manufacturers are tackling the cycle car and light car problem on the economical lines which giant capitals and huge outputs render possible. The same journal contains particulars of no fewer than fifty-five American cycle cars (I am specially smitten with the "Gadabout," the "Scout," and the "Little Princess," so far as nomenclature is concerned, though the "Dudly Bug" would draw my cheque every time). Sixteen of the machines have water-cooling, fifteen have shaft drive, and only three of the fifty-five cost £100 or over. I wonder muchly how many of the fifty-five have any actual commercial existence, and I wonder also how many of the fifty-two listed at less than £100 will make good. The cheapest is the 10 h.p. twin Real, with four friction speeds, tandem seating, and final V-belt drive at £58. The Editor opines that Great Britain will produce 30,000 cycle cars in 1914—another "Whew!" please, Mr. Printer. The weirdest egg in the basket is the Biautogo, described and illustrated in *The Motor Cycle* for August 21st, 1913. This is a genuine lightweight motor bicycle, of 35 h.p., with 935 × 135 mm. tyres, scaling 3,000 lb. and accommodating three persons. As the jump mount would try anybody but an athlete, two pairs of small pneumatically-tyred castors are provided astern, and a compressed air engine starter is included. Our editorial staff are unanimous in saying that the office boy will take the press trial when the Biautogo invasion comes. And this nightmare of a motor bicycle is the invention of a brother pressman—at which I blush for my profession!



A new three-wheeler which is shortly to be marketed is the A.Y which is fitted with 5-6 h.p. Stag engine, friction drive, six speeds forward and reverse. The engine can be started up from the seat.

STY HEAD PASS

The First Crossing By Motor Cycle

By GEORGE D. ABRAHAM.

Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc., etc.

A WAY into the heart of the mountains we sped. Grey crags loomed overhead through rolling mist-masses borne on a wind from the west, the wet quarter in Lakeland. It augured ill for the settling of the oft-disputed point, could a motor cycle cross the Sty? During the ascents of Skiddaw and Helvellyn last year, the writer's promise of something still more "spicy" had scarcely been appreciated by the motor mountaineers. How could the Sty, only 1,600 feet high, be harder than Helvellyn? Now there is no disputing the facts. The successful rider, again Mr. W. B. Little, bears ample marks to prove the hardness of the rocks on the Sty, and he also agrees that it is much the most difficult feat he has yet achieved. This is saying a good deal.

The Situation of the Sty Pass.

Few motorists who come to Lakeland fail to notice the back of a road crossing the main mountain mass joining up the east and west side of the beautiful district. The Sty Head Pass, which connects Borrowdale and Derwentwater with Wastdale, and thus seaward to Seascale, is the obvious route, and doubtless in years to come the grandest scenic round in all Britain will become an established fact. Some, and amongst them is the writer, will be sorry to see this special abode of mountain solitude disturbed. At present only the roughest of rugged rocky tracks serves for the crossing. All who have been misled by the maps into making the attempt on wheels will agree with this description.

"Ye may ga ower in a wheelbarrow, but nivver on a motor bike," was the encouraging prophecy we received from the farm folks at Seathwaite, where the road ended. The little village, famous for its collie dogs and record British rainfall, was surely never so stirred. At the outset the rain fell, the dogs fought, and cycles, cars, and sidecars whirred and barked in every direction. In due course Little extricated himself from the village and set his face up towards the misty heights. The first mile was, comparatively speaking, easy going. What mattered a sudden splash through a stony stream, continuous boulder jumping, or sudden bog sliding? All was fairly level running. Yet even this discovered the weakness of the chains which had been fixed round the driving wheel; worse still, the rough riding had restarted an ill-repaired leak in the petrol tank. The chains had to be left behind, like a "lot of other little things," such as silencer, footrests, starting handle, detachable bands, and numerous other details which proved unnecessary. Unfortunately a trail of leaking petrol was also left all the way up the pass, and this loss almost proved our undoing so far as success was concerned.

On the rough zigzags near the top of Sty Head Pass.

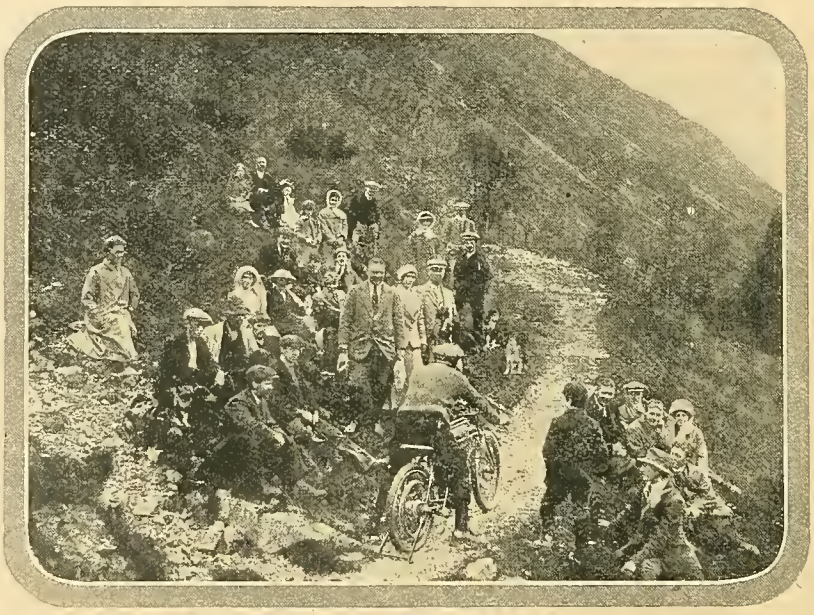
A Freak Climb with a Vengeance.

At Stockley Bridge, the quaint old reminder of how easily the Romans crossed here ages ago, the real climbing began. The track, a mere scratch in the mountain front, zigzagged up to the sky line. Soon Little was stirring the echoes sonorously, as, exhaust free, he dashed up to the rocks above the first grassy corners. Though astride it he was seldom on the saddle—one had a picture of him mostly bouncing in mid-air, with legs wildly waving.

Sty Head Pass.—

In places the path, shaped like a deep groove, ran upwards with turf and boulder-bulging walls on either side. In the depths of the narrow way, which was so constricted that footrests had to be removed, Little wriggled his way up skilfully but painfully. There was scarcely room for his feet. It was here that the hardness of Sty Head Pass was felt. At the next halting-place it was noticed that contact with a jutting boulder had made Little limp badly, but those were limper who had attempted to race alongside the rider up the rugged gradient. It was warm work.

About two-thirds of the way up a crowd was gathered, and wondered whether the wheels would grip the rocks. Some of us stood by to hold the rider should gravitation hit him too hard and threaten a backward fall over the edge. For here was an edge over which the prospect, in cool blood, was none too pleasing. At almost too high speed the Premier was set at its task. The loose zigzags were passed with loose stones flung far and wide, and straightway the front wheel rose at the foot of the "staircase." The steepness of the place flung the spinning wheel into mid-air, and for an instant it seemed that the heavy machine would topple backwards on the rider and carry him over the edge. There were audible signs of fright from the spectators. However, it was the work of an instant to clutch the machine whilst it stood on end, and then nothing would serve but another attempt. At slower speed this proved successful, and, amidst more applause than has ever before stirred the birds that haunt the wild crags overhead, machine and man dashed up to the easier zigzags.



A halt on the way up Sty Head Pass—a typical group of cheerful watchers.

Steel-studded Tyres Discarded.

One steep, rocky slab had yet to be scaled, and here the steel-studded band of the driving wheel was discarded; in fact, the ordinary grooved rubber tyre would doubtless have been better also on the lower difficulties. However, the rounded rocks were climbed on a second attempt, and soon the long grassy slopes occupied all attention. The driving wheel spun helplessly in the damp stretches. Some slithering acrobatics finally showed that the rough and stony path was to be preferred, and this was now followed more carefully.

Instead of crossing the footbridge, a notable landmark higher up the pass, Little preferred making a way through the river, and he was disagreeably surprised at the depth of the water.

Where Motor Cycles cannot go.

The easier upper section of the climb now only remained, but the soap with which the leaking petrol tank had been "doctored" had mostly been lost, and the precious spirit made its presence felt as well as smelt. Thus there was slightly erratic running to the summit. Sty Head Tarn loomed through the mist on the left like a great white sheet, and there was a passing glimpse through skurrying clouds of Scawfell Pike, seemingly straight overhead. In thick mist by the cairn on the highest point of the pass we talked over the possibility of its ascent by motor cycle. It should be understood distinctly that this mountain—England's highest—cannot be reached by a motor cyclist riding his machine. Lately an attempt ended before the real difficulties had begun, and at a place quite three miles from the actual top of Scawfell Pike. In any case, a machine, which reached a much higher point than this would have to be carried most of the last mile on the great boulders over and upon which the ordinary pedestrian has to jump and scramble in gaining the final summit. To ride here would be impossible.

The End of the Day's Work.

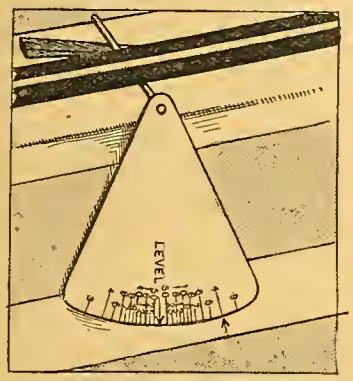
Having ended this excursion the party separated, Little and several of us continuing over the pass on the Wastdale side and the others returning to Borrowdale. The long, steep descent was not achieved without exciting moments, and there were many slippery collapses on the loose and stony surface of the apology for a track.

But soon below the gloom of the damp mist the clear air was reached and the valley revealed a thousand feet below, with the little white-washed inn gleaming like a bright omen in the greyness of the depths. Wastwater sparkled beyond in bright sunshine, and then the sea and its golden sands afar off. An hour later the normal road was under wheel once more. The tiring fifty mile ride round the mountains to Keswick was cheered by the day's success, and thoughts that the same place was only fourteen miles away from Wastdale over Sty Head Pass roused small desire to make the return journey by the same route—at least not that day. One such excursion is sufficient for a day, if not for a year.

AMONG THE ACCESSORIES.

The Dunhill Gradometer.

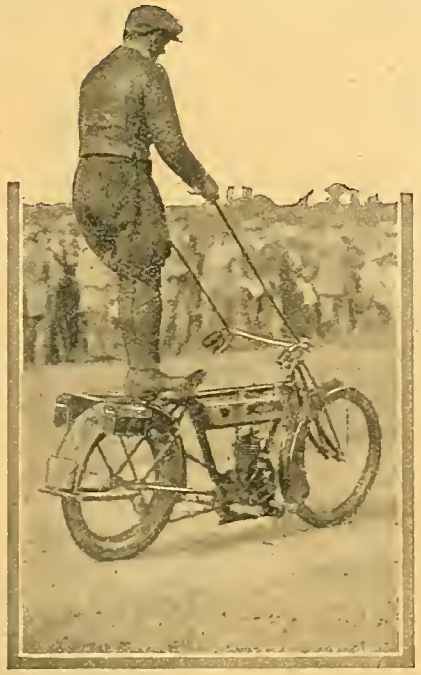
There is always much speculation and discussion amongst the spectators and competitors at a hill-climb over gradients. Moreover, the tendency is always to over-estimate, and a few actual readings on the various portions of a hill would create much surprise. Motor cyclists will



A simple form of gradometer marketed by Alfred Dunhill, Ltd.

therefore find that a little device like the Dunhill gradometer would prove itself to be of great use on many occasions. It simply consists of a scale plate and a pivot which is held in position by means of a wedge, as shown in the accompanying illustration. Before readings can be taken, the machine must be placed on a fairly level piece of ground. A mark should then be made on the tank, corresponding to the level position shown on the scale plate. This should be done twice, with the machine pointing in opposite directions; then, if the ground is not quite level, two marks will be obtained, and a point halfway between them will give the true level mark. If the machine be then placed on the hill, the gradient can be read off from the scale provided.

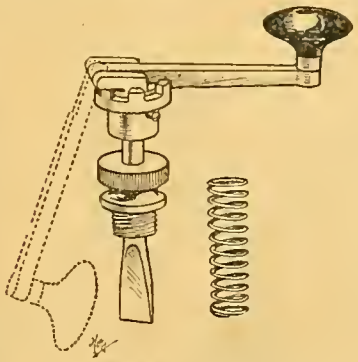
Miss Glostel, of Limerick, who is the only lady motor cyclist in her district. Her machine is a 3½ h.p. Rover.



Intermingled with the events at the Birmingham M.C.C. speed trials on the 27th ult. was a display of trick riding by Albert Milner on a Levis.

A Valve Grinder.

A valve grinding tool has lately been brought out by Messrs. Wood and Lamplugh, Tyseley, Birmingham. The device is intended to be screwed into the exhaust valve cap, and is sold complete with spring, so that when the pressure on the tool is released the valve can rise from its seating. It will be noticed that the top of the spindle holding the screwdriver is castellated, so that the position

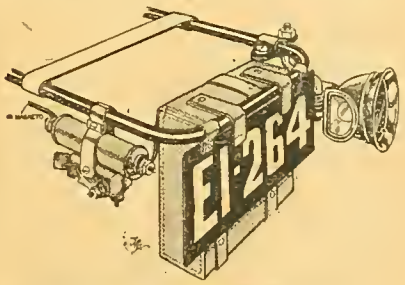


The Woodlam valve grinder

of the handle may be altered relatively to the valve in case the former is found to be in an inconvenient position. When it is required to grind in the inlet valve the exhaust valve cap is removed and placed into the inlet orifice. It will be noticed that the screwdriver is held rigidly and true over the centre of the valve, and since it fits into a sparking plug hole will fit any make of machine. When out of use the handle is placed in the position indicated by the dotted lines.

Lighting from the Magneto.

An addition to the many useful accessories placed on the market for motor cyclists by A. H. Hunt, 115, Cannon Street, E.C., is the Netolite rear lighting device, a system for illuminating the back number plate and showing a red rear light worked by the magneto. The accompanying sketch gives an idea of the Netolite. On the extreme right is the rear lamp; behind the number plate is a leather case for a "flash" Hellesen dry battery. On the left of the picture is an auxiliary coil, which acts as a damping device and ensures a steady current to the lamp, while below this is a two-way switch, allowing the lamp to be switched on when the machine is



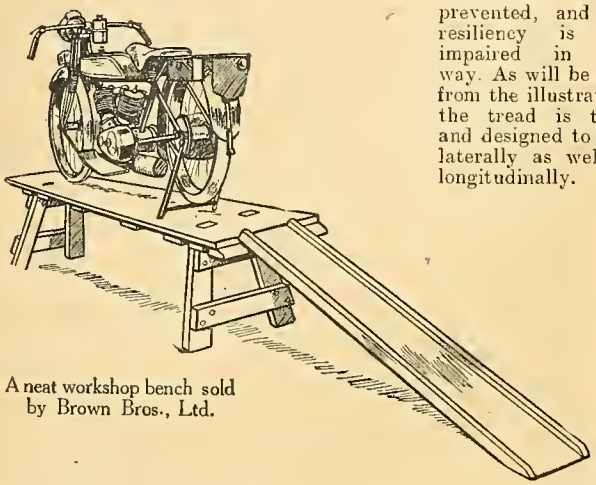
The Etolite rear lighting installation.

stationary. The battery alone supplies enough current for lighting the lamp for many hours. The light derived from the magneto is obtained direct from the low tension terminal on the contact breaker, to which the switch wire is usually fitted, and though it is rather unsteady at slow speeds, it is perfectly steady over about fifteen miles an hour. To have a two-way switch, enabling the lamp to be lighted when the machine is stationary, is an enormous boon, as then the law is easily complied with

Captain Okuizumi, a veteran of the Russo-Japanese war, with his 2¾ h.p. three-speed Humber. He is the author of a techincal book in Japanese on motor cycling.

The Challenge Motor Cycle Stand.

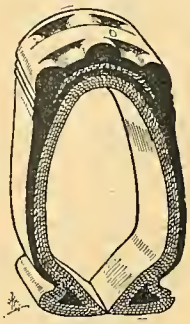
All motor cyclists know that the cleaning or adjustment of a motor bicycle is rather a back-aching affair, as the owner has to be continually stooping while adjusting or repairing his machine. To get over this difficulty an inventor has brought out the Challenge motor cycle stand, which is handled by Messrs. Brown Brothers, Ltd., Newman Street, W., and sold at a very moderate figure. The neat manner in which it is constructed is shown in the accompanying illustration. A ramp is provided so that the machine may be pushed up on to the platform. The platform itself is fitted with detachable legs, so that the whole may be dismantled in a few seconds and stowed away so as to take up very little room.



A neat workshop bench sold by Brown Bros., Ltd.

A New Wood-Milne Cover.

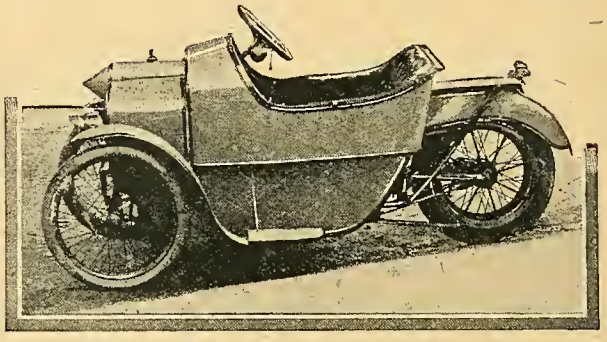
A new cover has been put on the market by the Wood-Milne Co which presents many unusual features. For instance, the shape when viewed in transverse section is that of a pear. Many advantages are claimed from this formation, for when inflated the tread is in compression, so that in the event of its being cut the tendency is for the cut to close and not to open. Furthermore, ingress of grit and water is also prevented, and the resiliency is not impaired in any way. As will be seen from the illustration, the tread is thick and designed to grip laterally as well as longitudinally.



Section of the new Wood-Milne cover.

A NEW THREE-WHEELED CYCLE CAR.

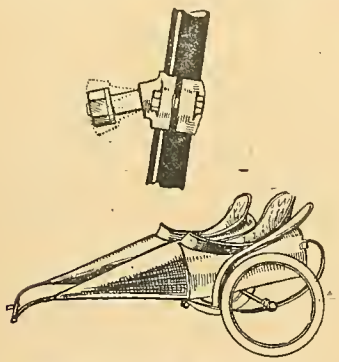
A new type of cycle car known as the Thurlow Three-wheeler has recently been built by G. H. Thurlow, Kingston Road, Wimbledon, S.W. It is shortly being placed on the market at the very moderate price of 75 guineas. It is fitted with an air-cooled 8 h.p. J.A.P. engine driving the back wheel by a 12ft. 1½in. belt through a Sturmey-Archer three-speed hub gear. As will be seen from the illustration, the little machine has a very compact appearance. Petrol consumption is said to be on a most economical seale, and the belt, on account of its great length, can be run very slack without any fear of slipping. The little machine is capable of forty-five miles an hour on the level, and will climb practically any hill. The Thurlow appears to be an admirable example of the simple type of cycle car.



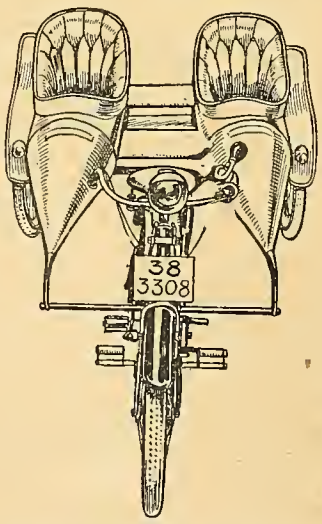
Side view of the Thurlow cycle car which is fitted with three-speed hub gear and belt drive.

The Sulky Trailer.

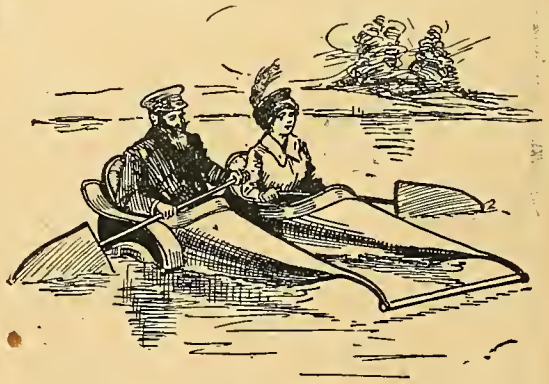
AN Italian inventor, S. Baratelli, of Milan, has produced a curious double trailer, which appears very like a double sidecar. The illustrations show clearly how the two trailers are flexibly coupled up by two parallel wooden luggage grids and sprung by two C springs carried on a two-wheeled axle, and are attached to the head of a motor cycle by means of a universal joint. This allows considerable movement to the trailers. The inventor states that the combination can take corners without the slightest fear of upsetting either when fully loaded, one only occupied or both empty, and that every ounce of motor power is used for hauling the trailers, and practically no strain is imposed on the motor cycle frame. Another interesting feature of these trailers is that they can be used as a canoe if removed from the chassis, as they float admirably. The invention is known as the Sulky trailer, and weighs about 150 lb.



Side view of the Sulky trailer, also showing method of attachment.



Front view, showing the trailer in position on the back of a motor cycle.



A use to which the Sulky trailer may be put.

The Care of Chain Transmission.

Some Hints for the Proper Treatment of Chains and Bearings.

THE average motor cyclist is one of the hardest persons to satisfy in the world. Before he has had his machine a few weeks he sometimes tries to get more power and speed, but his methods for satisfying his cravings are peculiar, and are nearly always in one direction.

He starts with perfect confidence to re-design the carburetter that has taken years in perfecting, but never gives a moment's thought to his transmission, the alignment of his sprockets, or the adjustment of the wheel bearings. He alters the magneto timing, and interferes with the engine compression, but he gives not a thought to cleaning the chains and gears. He strives in vain, by operations he does not sufficiently understand, to increase his engine power, but at the same time he is continually wasting the power he already possesses by neglecting parts that are easily within his ability and comprehension.

The pedal cyclist regularly and carefully examines his chain and wheel bearings, because he knows that any loss of speed has to be made up by his own muscular exertions. With a motor cycle, however, the engine does all the work, and very little attention is, therefore, concentrated on the transmission system.

Thoroughness the Keynote of Success.

In the regular overhaul of the motor cycle, every part of the transmission system should receive special and individual attention, including the chains, sprockets, gear box, and wheel bearings. The chain, of course, should come in for first consideration, because upon it falls the severest work. It should be cleaned with a stiff brush on top, bottom, and sides. A round brush should be procured to clean between the rollers. When the chains are being cleaned, the teeth on the sprockets should also be cleaned of the particles of grit that collect between them, because they prevent the chain from seating properly.

The chain should frequently be removed for a thorough cleaning. The dust and grit that have worked into the roller joints must be removed. To do this, place the chain in an oil tin and fill up with paraffin. Screw the cap on tightly and shake well. This process will work the links about, and it is surprising how much dirt will be extracted. After this washing, put the chain into a bath of tallow and graphite. Stir the chain round when heating the mixture in order to work it well into the joints. The chain should then be hung up, and the tallow wiped off while warm.

Renew Sprockets as well as Chains.

The most trifling wear in each rivet will make a considerable difference when the total number of rivets in the chain are added together. The result of this lengthening therefore increases the pitch of the chain which prevents the rollers from assuming their proper position on the sprockets, the chain having a tendency to ride on the teeth.

When a neglected chain has to be replaced, it will be found that the sprockets are so badly worn that the teeth will not mesh properly with the new chain. This, therefore, means buying new sprockets.

Precautions should be taken that the gear box is in perfect alignment, otherwise the sides of the teeth on the sprockets, and the inner faces of the chain plates, will be worn. When dismantling the chain to be cleaned, examine it for any signs of wear in these directions. If it is found to be the case, it must be remedied immediately if the best results are to be obtained.

Correct Chain Tension Most Important.

The adjustment of the chain is a feature that greatly affects its longevity. The tension of the long chain should be such that it can be pressed just $\frac{3}{4}$ in. at its mid-width and the front chain about $\frac{1}{4}$ in. If there is too much slackness the high speed at which the chain runs will tend to throw it from the sprockets, or make it ride on the teeth, which, of course, is simply courting a smashed chain.

A slipping clutch is a great source of loss of power, and should be remedied immediately. If the clutch is released before the lever has been moved its correct distance, it is evident that the clutch is not gripping properly when thrown in.

Lubrication of the clutch should be done regularly. That golden rule, "a little and often," applies very forcibly here. A good grade of clutch oil—sold by the makers expressly for this purpose—should be used, and not heavy cylinder oil. The film of oil forms a cushion between the plates of the metal-to-metal clutch, and permits them to come into engagement smoothly and gradually. If a heavy cylinder oil is used, it will tend to clog up the clutch discs, and prevent them from engaging properly. Plate clutches should be regularly swilled out with petrol or paraffin, and then re-charged with fresh oil.

A Word Concerning Lubrication.

All wheel bearings, and gear box bearings, should be regularly lubricated. It is better to pack the bearings with thick grease instead of ordinary thin oil. The thick grease, which tends gradually to work out of the bearings, will also keep out any grit or water that would otherwise find its way into the cones and ball races. When lubricating these bearings, it is advisable to examine them and see if any re-adjustment is needed. There is always a liability of them working loose, and they should be adjusted so that only the slightest amount of play is perceptible.

Generally it is safe to say that the average rider will derive more benefit from attention to the transmission of the machine than any alteration that he can make to the engine—economical, reliable, and smooth running being the result obtained. G.S.P.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

In the Eastern Counties.

I propose spending a week of my holidays at Lowestoft this year, and would be very grateful if you could give me half-a-dozen places of interest worth visiting in that vicinity, each journey to be about sixty miles there and back.—A.G.W.

The question you ask us is really rather outside our province. Your best plan would be to apply to the Touring Department of the Auto Cycle Union (which you can join if not already a member), and they will send you free of charge a book of that part of England giving the places of interest. Lowestoft is quite close to the Broads, where you can amuse yourself immensely. There are numerous fine old churches at places like Loddon, etc., and the country round is most interesting.

A Collision with a Horse.

I should be glad of your opinion respecting an accident which has occurred to me. I was riding a motor cycle on a main road on my right side, and approaching me was a horse and trap also on its right side. Just before I got to same the horse evidently took fright (it was a young horse being broken in) and dashed right across the road in front of me, causing me to smash into the trap. I sustained a broken collar bone and other smaller injuries, and, of course, the motor cycle was very badly damaged. Under the circumstances, can I claim damages? I was given no warning from the driver of the horse.—G.H.

We have obtained our legal adviser's opinion on your case, which is as follows: "The question of liability is determined by ascertaining which, if either, party was guilty of negligence, and upon the facts before me it is practically impossible to do this. It has been laid down that the mere trying of horses whose temper is unknown to the rider in a frequented thoroughfare, whether in harness or otherwise, is not by itself evidence of negligence, nor does the mere bolting of a horse constitute conclusive evidence of negligence on the part of the person in charge of it. Although there are decisions to this effect, the question of negligence being always one of fact and not of law, it may very well be that your correspondent would have a right of action against the driver of the carriage, as he may be able to explain the bolting of the horse and show how it was caused (*e.g.*, by the inexperience of the driver or by his attempting to pull up when driving at an improper pace)."

The Noise of a Two-stroke Engine.

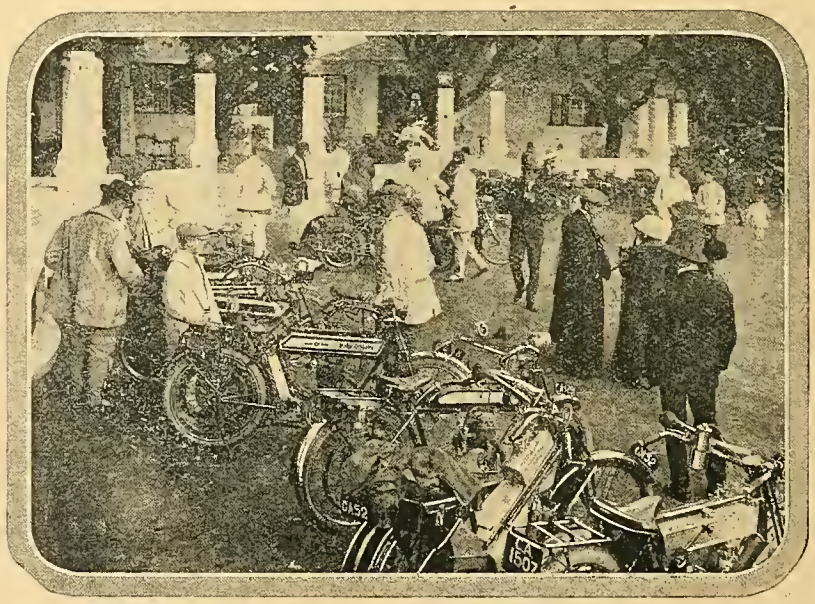
I have noticed a peculiarity about many small two-stroke machines on the market. This is the curious noise many of them emit. It does not appear to be exhaust noise, nor does it seem to be an unmechanical sound, and the strangest part of the matter is that one can often hear these machines approaching more clearly than when they have gone by, despite the exhaust being naturally directed backwards. The sound is a curious drumming sort of noise. Can you explain it at all? —ENQUIRER.

What you describe is probably simply due to the increased number of explosions in a two-stroke over a four-stroke in a given period. These little engines, if not actually running at a greater number of r.p.m. than four-strokes, are much "busier," and are inevitably bound to buzz a little. The noise being more apparent when the machine is approaching than when departing is a thing we do not pretend to explain, but we have noticed it ourselves in one or two cases. The same phenomenon is observable with the Gnome engine in aeroplanes.

North London to Barmouth.

I am shortly going to spend a holiday at Barmouth, and I should be obliged if you will let me know the best way to get there from N. London, and how to return by a different route? What are the most interesting places in that district? My machine is an 8 h.p. Bat two-speed and sidecar, so I do not mind hills.—G.J.M.

We should advise you to go by Barnet, St. Albans, Dunstable, Fenny Stratford, Stony Stratford, Towcester, Weedon, Daventry, along Watling Street through Atherstone to Shrewsbury, then through Llangollen, Bala, Dolgelly, to Barmouth. You could return by Towyn, Aberdovey, Machynlleth, Newtown, Bishops Castle, Ludlow, Tenbury, Evesham, Moreton-in-the-Marsh, Chipping Norton, Oxford, Tetsworth, High Wycombe, Beaconsfield, to London. If you wish for further information regarding the interesting places in the district, we should advise you to apply to the touring department of the Auto Cycle Union, 83, Pall Mall, S.W., or the Automobile Association and Motor Union, Fanum House, Whitcombe Street, W., both of whom make a speciality of planning out tours for members.



SCENE AT A RALLY ARRANGED BY THE CAPE PENINSULA M.C.C.

First arrivals in the grounds of the Royal Hotel, Houl Bay. In the foreground will be seen P. and M., Douglas, Humber, Rudge, Premier, F.N., and Matchless machines.

A Taxation Query.

Early this year I owned a motor cycle. Now I have sold it and bought a cycle car. I paid the twenty shilling revenue tax on my motor cycle, and I wish to know if I need pay anything more now than the difference between the motor cycle tax and the cycle car tax, namely, a matter of twenty-two shillings.—A.M.C.

No, you need only pay the difference. The twenty shilling tax you have already paid is valid for twelve months, and if you have disposed of your motor cycle this sum will be carried forward to the credit of your cycle car tax. Of course, if you have had both in use at the same time, even for a single day, you would be liable for the tax on each machine.

Carburetter Dries Up.

I have a 1911 3½ h.p. motor cycle, and lately I have experienced carburetter troubles which I am unable to remedy. The machine travels well, as a rule, on the level, but when ascending hills petrol fails to reach the float chamber, with the result that the machine is brought to a gradual stop. When I flood the carburetter all is well again. I fitted a new needle, as the old one looked worn, cleaned carburetter and petrol pipe from the tank, with the result that I cannot now flood the carburetter at all, though the machine, if anything, seems to develop more power. I still experience, however, the same trouble on hills.—B.V.R.

Possibly the float chamber is fitted behind the vaporising chamber, so that when the machine is tipped up on a hill petrol does not reach the latter. Try setting the float chamber in the forward position, when the trouble will probably cease. If it does not, we should recommend you to write to the makers of the carburetter, who will doubtless be able to remedy the defect.

A Magneto Eccentricity.

A strange experience befell me the other day. I was running my motor cycle engine on the stand, and was varying the ignition lever. When fully retarded the engine, a 2¾ h.p. single-cylinder, immediately stopped firing, as though the current had been suddenly switched off. Thinking the mixture might be too weak to be fired by a retarded spark, I tried again with a stronger mixture, but the result was precisely similar. Since then a friend who owns a small four-cylinder car tells me he has had an exactly similar experience. Can you suggest a cause?—M.F.W.

Your experience is certainly peculiar and puzzling, and it is difficult to give a reason unless one can examine the particular machine; but we are inclined to think that in fully retarding the magneto you do not merely weaken the spark, but actually eliminate it altogether. Probably what happens is that there is oil and foreign matter spread about the contact breaker, and that a thorough clean with petrol will effect a cure. A dirty connection between the contact breaker cover and the spring securing it will cause the symptoms you describe.

Southward from Carlisle.

Would you be good enough to give me a route from Carlisle to Biggleswade, taking in Chester but avoiding Liverpool and other large industrial towns?—TOURIST.

The route we would suggest from Carlisle to Biggleswade, if you wish to avoid as much traffic as possible, is to proceed from Carlisle to Penrith and thence *via* Appleby, Brough, Barnard Castle, Scotch Corner, and then down the Great North Road, but if you wish to take in Chester, proceed *via* Penrith, Kendal, Lancaster, Preston, Wigan, Warrington, Chester. This route brings you into traffic *via* Wigan, but otherwise is admirable. From Chester go *via* Nantwich, Stoke, Uttoxeter, Burton, Ashby-de-la-Zouch, Leicester, Market Harborough, Kettering, Higham Ferrers, Bedford, Biggleswade.

Durham County to North Wales.

Will you kindly give me the best road to follow from Bishop Auckland to Conway, North Wales? I am not nervous of hills.—H.N.H.

It is difficult to advise you which is the best way to take for the early part of your journey, as the route lies through populous manufacturing districts over, for the most part, rough roads. We think perhaps the best way would be to proceed as follows: Bishop Auckland, Richmond, Ripon, Harrogate, Leeds, Huddersfield, Stalybridge, Hyde, Stockport, Altrincham, Northwich, Chester, Mold, St. Asaph, Abergele, Colwyn Bay, Conway. The portion between Leeds and Stockport is bound to contain a good deal of unpleasant riding conditions, but from Stockport onwards the road is delightful. We advise you to take the route we give in Wales in preference to the coast road.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"C.F.M." (Letchworth). — Electric Indian and 6 h.p. Sunbeam. Reliability, wearing qualities, adaptability to solo use as well as sidecar, etc.

"P.C.H." (Eye).—Carden Monocar or Aviette. Petrol consumption, reliability, speed, wear of tyres, etc.

"J.B.J." (Ayrshire).—New Ryder 2½ h.p. two stroke and Wolf 2½ h.p. model A. Reliability, petrol consumption, hill-climbing, and speed.

"Ella" (Ireland).—Sunbeam 2¾ h.p. with wicker sidecar. General efficiency as passenger machine and m.p.g. Also Scott. Hill-climbing power, m.p.g., and use of benzole.

"C.A.M." (Kingstown).—3½ twin Motosacoche. Reliability, speed, hill-climbing with sidecar.

"G.W.K." (St. Ives).—Harcourt radiators fitted to a 3½ h.p. single-cylinder machine.

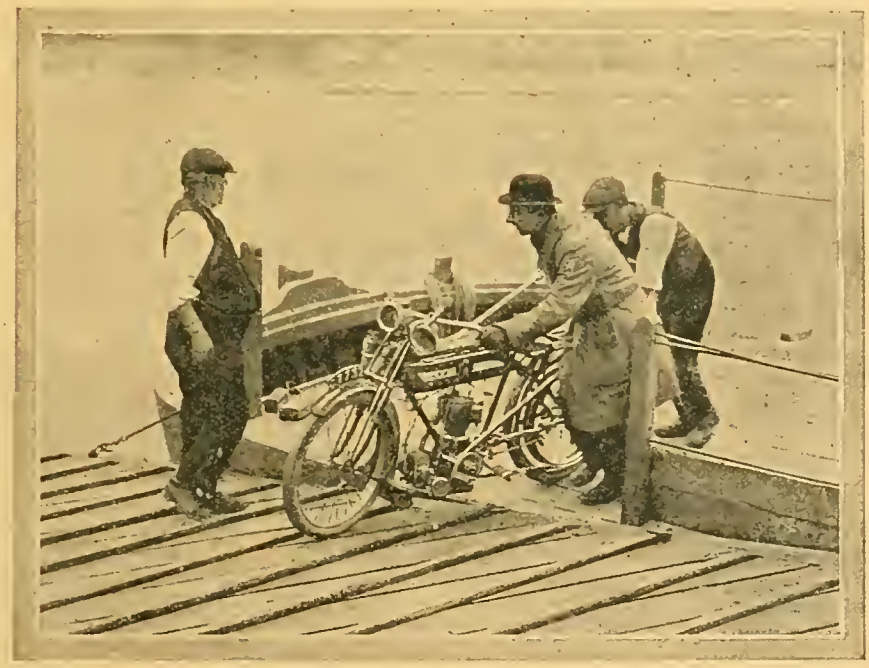
"A.B.C." (Herne Hill).—3 h.p. Royal Enfield. Reliability and speed. Also reliability of forced feed method of lubrication on this machine.

"T.M." (Pontycymmer).—Indian motor cycle. Reliability, etc.

"H.S." (Bristol).—Reliability, petrol consumption, etc., of small two-stroke machines.

"J.E.H." (Plaistow). — Wear and durability of Pedley, John Bull, and Dunlop belts.

"C.W.H.C." (Yeovil).—7 h.p. F.N. and sidecar and 7 h.p. Matchless, fitted with M.A.G. engine, and sidecar. Reliability, cost of upkeep, hill-climbing, speed, and comfort.



NEW MOTOR FERRY OVER THE OUSE.

The ferry at Boothferry, which connects the road between Goole and Howden, East Yorkshire, is now equipped with a ferry boat propelled by motor power. The photograph shows a B.S.A. rider disembarking.

Lessons of the Scottish Trials.

Good and Weak Points of Design indicated by this Severe Test.

THE Scottish Trials rank as the most formidable event of the year, for if the A.C.U. have learnt to include some terrific hills, English roads cannot furnish such an enormous total mileage of bad going, nor any gradients of such appalling *length* as Tornapress, Applecross, and the (unfortunately discarded) Rest and Be Thankful, each of which spells over six miles of continuous ascent. To put it in a nutshell, a rider who encounters trouble in Scotland is almost bound to lose his medal; the corners are so numerous, loose, and severe, and the road surfaces so atrocious, that it is next to impossible to recover lost time by "blinding."

Three very gratifying features emerge from the welter of incidents. The first is the marvellous scarcity of detail troubles. Lost nuts, stretched control wires, missing front brake shoes, broken spokes, and suchlike trifles may be trumpery annoyances alike in touring and competition, but they entail a certain amount of trouble and expense. This year they have been conspicuous by their absence. Neither in the quarter of an hour allotted for work on the machines before breakfast nor in the waits outside controls have we seen many riders occupied with these petty nuisances. To quote a signal example, it chanced that we very frequently had J. T. Wood's G.W.K. under observation at such moments. Wood is a particularly watchful and painstaking driver, and a 9 cwt. four-wheeler is peculiarly susceptible to such tiresome mischances as we have indicated: but he never seemed able to find a loose nut on his twelve month-old car.

Hills Beaten by Modern Engines.

The second and even more eminent feature of the trials has been the supreme mastery of the hills evinced by all the engines down to the little Clyno baby two-strokes. We say "engines" advisedly. A reference to the tabular results will show that there was a large percentage of stoppages on hills; but the vast majority were wholly ascribable to rank bad driving, and especially to clumsy steersmanship on hairpins. With the exception of certain overgeared machines we never once saw a single well-driven cycle or sidecar conk out because its engine was unequal to the gradient. Without a shadow of doubt many of the 500 c.c. solo mounts could have got round the course on middle gear, without recourse to the emergency ratio, if the drivers had cared to run greater risks at the hairpins. There were not many "baby" machines entered, but such as came devoured the hills with consummate ease. No spectator could have picked out the miniature engines by listening to their beat on the hills.

The third glory of the week was the splendid reliability of the variable gears. No course could give a gear more gruelling, and out of 123 starters less than half a dozen experienced gear troubles. Transmissions as a whole proved absolutely reliable.

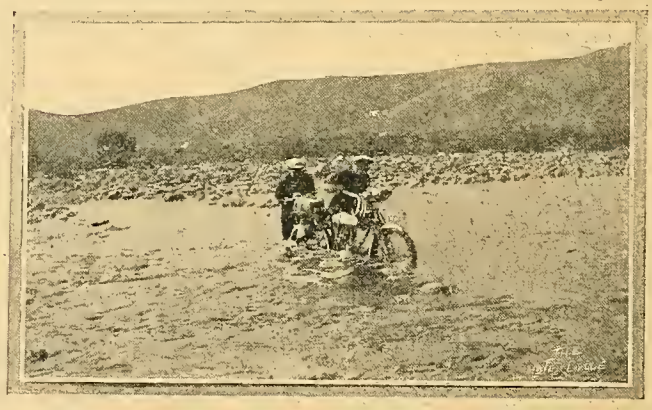
It is difficult to deal with the tyre question at all definitely, as there is no real clue to the number of stoppages experienced, but, trusting our own observation, we should estimate that far less time was lost from tyre troubles than in any previous Six Days. The commonest type of cover was the 26in. × 2⅜in. extra fort: and there is no doubt that this size will stand a lot of banging about.

Improvements Wanted in Sidecar Chassis.

Turning to the darker aspect of the week, the wholesale disablement of more than half the sidecar entry, due in most cases to serious structural fractures, gives one furiously to think. Sidecars of many leading makes were involved, and in most cases they were very tenderly nursed by expert drivers. Moreover, the case against them is blacker than the official results suggest; some of the survivors used spare couplings *en route*, etc. In some cases the design was grossly absurd; what are we to think, for instance, of a maker who fits a saddle pillar to axle stay curved like Cupid's bow, solely to clear his C springs and patent luggage grid? But this conclusion is inevitable. Existing sidecars are too weak, intrinsically, for really bad roads and very heavy country. The comparative success of the cycle cars, including the light high-powered Morgan three-wheeler, suggests that the side stresses inherent in sidecar design are the real culprits, and that no thickening of parts or recourse to special steels can ever wholly obviate the danger of similar collapses in work of this character.

The trials further sounded the knell of those variable gears which, by reason of design, are limited to high emergency ratios. Two or three makes are implicated.

The cycle cars did quite extraordinarily well considering the excessive severity of the route, and the G.W.K. and Humberette teams especially deserve the highest credit. One cannot help noticing that the cycle cars sustained no structural fractures, as a contrast in their favour against the sidecars.



Fording rivers is often necessary in the Colonies and Overseas Dominions, and the above photograph depicts a Wellington, New Zealand, rider crossing a drift. The fact that motor cycles can be put to this use and immediately restarted shows the perfection to which water-proof magnetos have now been brought. The Zenith machine shown is equipped with a Bosch magneto.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Thunderstorms.

Sir,—I have discovered something new this "thunderous" period which I have no recollection of seeing commented upon in any of the motoring papers, namely, that in a thunderstorm the safest place to shelter is on the machine itself, and, if a sidecar is attached, passenger and rider can cover themselves over with a gamp or sheet and defy the elements. We are *doubly* insulated against lightning with rubber tyres and the air they contain. We have had a lively week in the north, and water-splashes have been as numerous as "Letters to the Editor." My wife and I rode through one on the Otterburn Road on Sunday at 40 m.p.h., and were absolutely drenched from head to foot, the water "covering" the engine. A gunful of petrol and a wipe round with a rag reinstated the spark. "X 37."

Thames Ferries.

Sir,—Having recently taken my motor cycle from this town (Harwich) to Sheerness and back, it has occurred to me that there are many of your readers who may wish to travel from the Eastern counties to Kent, and who are unaware of an excellent short cut. There are two ferries—Tilbury to Gravesend, and Southend to Sheerness, Chatham, etc. The former is the only way for sidecars and cycle cars, and the road leading to it from Billericay is very second-rate and hard to find. As regards Southend for solo machines, the fact that one has to push the machine along the pier, almost a mile long, if not more, takes the gilt off the gingerbread. Otherwise, as will be seen from the map, an enormous saving is made, amounting, in my case, to over twenty miles.

Could not the A.C.U. approach the pier authorities? They could enforce a speed limit of 3 m.p.h. if necessary, and would profit by it, as they already have many porters there. R.N.

[We have submitted the contents of this letter to the A.C.U. Touring Department.—ED.]

Extra Radiators for Air-cooled Engines.

Sir,—In the spring of this year I bought a second-hand motor cycle with sidecar. The engine is a 3½ h.p. single fitted with N.S.U. two-speed gear, and the sidecar a rather heavy cane body with underslung chassis, a large space being provided under the seat in which I carry all my tools, repair outfits, spare tube, and belt, etc., these totalling roughly two stone weight. I always go out into the hilly parts of the Dublin mountains and through County Wicklow, which is known for terrible hills, bad roads, and splendid scenery. On my runs with a passenger I almost always was troubled with overheating when tackling long stiff climbs. On reading of the Harcourt radiators in *The Motor Cycle* I ordered a pair, which were easily fitted. The change they made to the running of the engine was simply extraordinary, the power seemed to have increased by a couple of horse power, while overheating disappeared at once; the oil consumption also decreased considerably. I can now, with ease, take two passengers where I previously found difficulty with one only. DUBLIN.

Best Width of Sparking Plug Gap.

Sir,—We frequently have brought to our notice various ingenious designs of sparking plugs. The most usual device on which these designs are based is that of a variable gap sparking plug; the designs embracing both automatic and hand adjustable gaps. Now all these designs are based on a wrong impression of what is required, and we think that our own experience will be of some interest.

Several years ago we made a few sparking plugs with spark gaps that could be varied by hand by a knob on the outside. There were two positions in which the knob could be placed, one labelled "Starting" and the other "Running." By placing the knob in the "Starting" position the spark gap was set to $\frac{1}{10}$ in., and with the knob in the "Running" position the spark gap was $\frac{25}{1000}$ in. These plugs were given to five experienced motor cycle riders to test, and we expected to have reports of extremely easy starting with these plugs. The report in four cases was that the plugs were quite good, but no better than any good ordinary plug, while the fifth report was that the plug was very bad for starting. This was disappointing, but on investigation we were astonished to find that four of the testers had ignored the printing on the knobs, and always started up their engines in the position marked "Running," and when the engine was started, turned the knob to the "Starting" position. The fifth tester, who found the plug a bad starter, was the only one who used the plugs as we had intended. These results led to further investigations on this subject, and we then found that, contrary to what we had expected, *it was more important to have a large spark gap at starting than at any other time.*

The explanation, of course, is that difficulty in starting is nearly always due to a weak or patchy mixture, rather than to failure of the magneto to give a current of sufficient pressure to jump the gap. This proved that there was no advantage in an adjustable spark gap plug, as while the spark gap was required as big as possible for easy

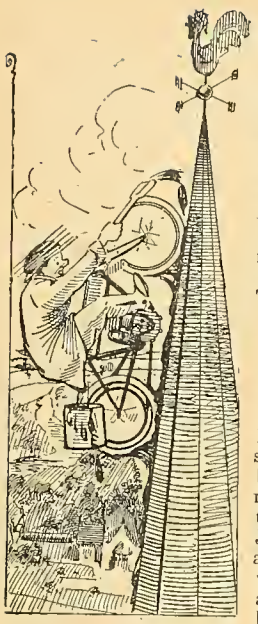
Section of Glengesh Hill, which proved a stumbling-block to many of the competitors in the Irish 24 hours open trial, and which has been included in the last three Irish trials. Two hairpin bends, a right-angle corner, and a portion of 1 in 3.6, are the main features of the hill, which rises to 600 feet in a mile.



starting, there was no advantage that could be traced in altering the spark gap either way for running. However, an important result from these experiments was that we increased the setting of the spark gaps on the standard model Lodge plugs from $\frac{20}{1000}$in. to $\frac{25}{1000}$in., and at the present day we are setting the spark gaps to $\frac{30}{1000}$in., which, we find, gives the best results with the average modern engine and modern magneto.

THE LODGE SPARKING PLUG CO., LTD.
ALEC M. LODGE, Director.

The Freakiest Climb.

Sir,—I enclose drawing of my latest climbing feat. As you will see, it was an interesting exploit, but the radiators on my cap kept me cool and collected. Owing to the danger of skidding I used Johnnie Dewar's spirit to counteract the dryness, and glue to prevent sticking. I felt no ill effects afterwards except for a very severe headache next morning.

"SCOULLER."

British Machines in Germany.

Sir,—Reading your article about "British Motor Cycles in France," I beg to inform you that the number of English machines in Germany, specially in Munich, is visibly increasing. Here are more Douglases running than N.S.U.'s or Wanderers, which are doing their utmost to compete with English machines as regards appearance, construction, and reliability. The Douglas and Indian agent in Munich is doing very well indeed. If this man could get quick delivery he could sell a good many more. There is also a B.S.A. agency here which is doing fairly well already. Our motor cycle club, for instance, counts about thirty-five members. Most of them are riding English and American motor cycles (Douglases, Indians, P. and M.'s, Broughs, Scotts, and B.S.A.'s). The country around Munich is very hilly indeed, and all the machines are splendid hill-climbers. Reliability runs, hill-climbs, etc., are held nearly every month.

ROBERT CAP.

16/11, Knoebelstrasse and 35, Theatinerstrasse, Munich.

Advice to Overseas Riders.

Sir,—I often see enquiries in your paper as to the Binks carburetter on a Scott. I have been a Scott rider since 1910, but I never realised the perfection of this machine till I fitted a Binks three-jet carburetter this year. The Binks allows quite slow free engine running, no petrol injection, wonderful acceleration, no flooding, however long left with petrol tap open, very slow running on the pilot jet, and any amount of power when the other jets are opened up for fast work on hills. The extra air lever used as a brake is a splendid help on bad roads.

I also see letters from Colonial readers as to difficulty in getting accessories, etc., per return. A small deposit with a good firm will fetch most things per return mail. The Service Company, of High Holborn, have supplied me unfailingly to South Africa, Ireland, the Malay States, and Burmah with goods stocked in their catalogue and procured from other firms also.

H. G. KENNARD (COLONEL).

Magui, Burmah.

The Question of Gears.

Sir,—I absolutely fail to comprehend why the public are made to gasp over the so-called magnificent performances of the 2 h.p. motor cycle in climbing ultra-steep gradients. They go, they see, and they come away, saying what wonderful things these little machines are, and they ask why cannot an ordinary 3½ h.p., which has practically double the power, do the same? Then you endeavour to explain that the 3½ h.p. has double the power. It has also double the weight, and last but not least a gear which is many times higher. The matter of gear not engine power is the secret of success in climbing freak hills in trials. May I suggest that a trial be held in which the lowest gear is restricted to 5 to 1 for all the 500 c.c. solo, *pro rata* for the rest, and then we shall see what we shall see, and not till then will the engine which has the best qualities come out trumps, not only that, but it will bring out a certain amount of driving skill (if any) in some of the competitors.

E. R. STRANGER.

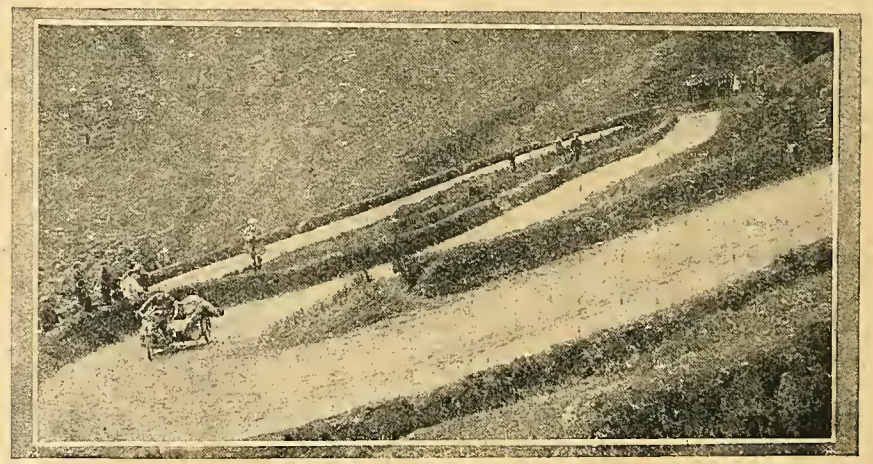
A Lightweight Tourist Trophy Race.

Sir,—As a lightweight enthusiast, and regular reader of *The Motor Cycle*, I should like to thank you for the interest you are taking in the lightweight movement. I observe that it is suggested the cubical capacity be limited to machines of 250 c.c. and under, but do you consider this fair? If such be the case the Villiers unit with a 269 c.c. will be excluded, and as this is such a popular little engine, it appears rather harsh FREDERICK C. CLEETON.

Sir,—In reference to the proposed T.T. race for lightweight motor cycles, I may say that I know a dozen men here in Geneva who would buy a motor cycle at once if they could find what they want. Like "Ixion's" correspondent referred to in "A Gap in the Market," they want a really, light, reliable machine for running out to the golf club or to business. Speed is not desired, but light weight, reliability, and low cost, and some mechanism that will give an absolutely free engine for coasting hills is essential. They are all old bicycle riders, and what we want is a machine weighing between 80 and 100 lb., costing not over £30 or £35, that one can jog about on at a 10 to 12 m.p.h. gait, and "get there and come back."

As to the T.T. race, by all means limit the weight and the price. It seems to me though that the T.T. race will only cater to the development of speed, and that is the very last thing wanted by the type of people who will eventually buy the machines. A six days 100 miles test over give-and-take roads at a 12 to 15 m.p.h. speed would be a much better test, the lightest and cheapest machine that finished with the least loss of marks to win the trophy.

Geneva, Switzerland. EDMUND CASEBY, M.D.



IRISH 24 HOURS RELIABILITY TRIAL.

R. E. Guest (7 h.p. Matchless sidecar) making a clean ascent of Glengesh Hill—which stopped many competitors. It is the most severe hill in Ireland, and a contour section with gradients is given on the previous page.

Bristol B. and M.C. Open Hill-climb

Sir,—With reference to the above event, held June 27th, and the excellent account appearing in *The Motor Cycle* last week, I am asked to inform you that the provisional results have now been confirmed, and will thank you to be good enough to publish that statement.

I might add that the only possible error is in connection with Class I., for miniature motor cycles, where the Levis is credited with practically an impossible time for such a mount, but as the time given is that taken by the official timekeepers the result must stand as issued.

ARTHUR S. RICHARDS (Hon. Sec.)

Classes in Hill-climbs.

Sir,—As an occasional competitor in club events, may I be permitted to make a suggestion to secretaries, etc.?

In many cases the classes at hill-climbs and speed events for solo mounts include "up to 500 c.c.," "up to 750 c.c.," and over 750 c.c. The "up to 750 c.c." class is usually considered as being for the 5-6 machines, but it is a fact that the most popular make of 6 h.p. twin has a capacity of 770 c.c., and so those of us who have realised the unquestionable superiority of a 6 h.p. machine over a 3½ h.p. for touring have to go into the "unlimited" class.

This in itself would not be so bad, but it seems that when a man uses an 8 h.p. for solo work he has become an incurable speed merchant, and usually has an overhead valve engine while he is about it. I feel sure that by altering the 750 class to "up to 770 c.c.," as some clubs do already, this class would be much better supported. CASTOR.

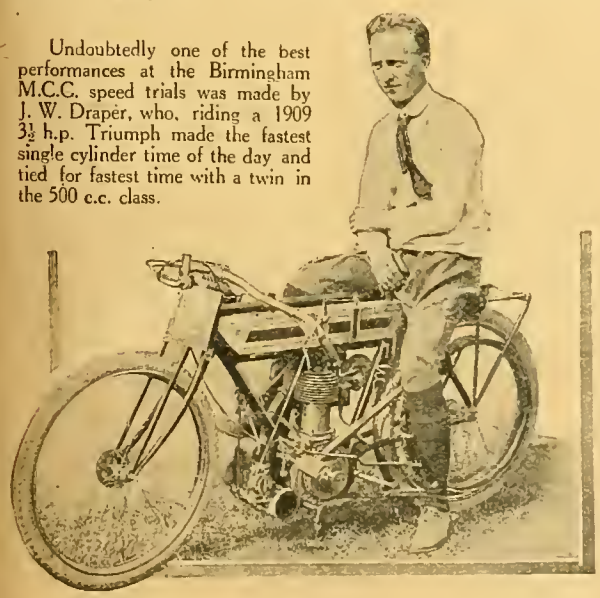
Suggested Double-purpose Machine.

Sir,—I write to you on the old but ever-interesting question of the best type of machine for particular purposes. I am constrained to do so by the fact that the particular type I consider best for my purposes has been somewhat "blown on" by some riders lately. Perhaps my conclusions are wrong, and if so, I shall be very glad to hear the opinions of others, and to have my mistakes pointed out.

The problem I have to solve is this, viz., a machine which will take me away for week-ends to a distance of sixty to eighty miles, which can be ridden solo when luggage is light, or with sidecar for more luggage or for the company of a passenger. I do not want wind screens.

This seems to indicate a machine (1) having belt drive and adjustable pulley, to allow for getting suitable ratios for solo, sidecar with luggage, and sidecar with passenger; (2) a machine which can keep up a speed of forty miles an hour with sidecar, without drying up or burning valves.

I mention this speed because an eighty-mile run into London on Monday morning means rapid travelling, or else a very early rise.



Undoubtedly one of the best performances at the Birmingham M.C.C. speed trials was made by J. W. Draper, who, riding a 1909 3½ h.p. Triumph made the fastest single cylinder time of the day and tied for fastest time with a twin in the 500 c.c. class.

Allowing for speed limits, etc., a machine of this speed would run up from, say, Portsmouth, in three hours, not less. Its minimum speed should be about forty-five to forty-seven with sidecar, and sixty or a trifle more solo; (3) a machine with a change-speed gear.

Now it seems to me that the nearest approach to this specification is a 750 c.c. twin with a hub gear. I have at present a single-cylinder with a hub gear, and the only faults I have to find are insufficient power for these speeds and a tendency to clutch slip. But the 750 twin would probably cause less slip than the 500 c.c. single, and in any case it is surely possible for the hub gear makers to put in a stronger spring or a few more plates. If they would do this one could use decent thick oil (engine oil) instead of the watery stuff at present advised.

Now for alternatives, of which there seem to be only two: (a) a chain drive machine. But the gear cannot be changed so easily, and I really do not see the object in adding two chains, chain cases, spring drive, and counter-shaft, to avoid the trouble of carrying a spare belt. I can get 2,000 miles out of a belt on my present machine or rather more, and I can put on a spare belt in a few minutes. If only people would see to their spare belts at home and have them of the right length we should hear much less of belt "troubles." A 750 c.c. twin should be no harder on the belt than a 500 c.c. single. (b.) The other alternative is a chain to counter-shaft and belt to back wheel.

But, I ask, why all this additional complication? A direct belt drive is all right if the machine is powerful enough to pull a decent high gear. If, in addition, the gear box is in the counter-shaft, there are further disadvantages. In wet weather the belt is certain to slip on a low gear, while with the hub gear the belt speed is kept up, and even on hills slip is not unusually troublesome.

Also, many makers, for reasons best known to themselves, do not fit adjustable pulleys to counter-shaft machines, thus losing the greatest advantage of the belt.

To conclude, I maintain that this is the best specification for a sidecar machine, to equal the performance of a good 15 h.p. car and to do serious touring: 750 c.c. twin; direct belt drive; three-speed S.A. gear, improved as stated, and mounted in blocks which are clamped into the fork ends, so that it can be quickly removed; light sidecar. No fal-lals.

H.J.W.P.

Adjustment of Carburetter.

Sir,—The letters on the above subject do not go half far enough, as no hints or suggestions are given to help novices. Perhaps some of your readers will be good enough to give a few hints.

When I bought a motor the firm sent the wrong carburetter, and I had to take it off and exchange it for the one I fancied, viz., a Senspray. Try as much as I could, not a single start could I make with the kick-starter. A fellow rider told me to weight the float. This I did by putting on a small collar on top of the needle, and I have since had no trouble or very little, but it seems to me rather a "home patch." This may be a hint for others who have similar trouble, but I should like to hear of a better way of tuning up. If one starts putting solder on a float, as I have seen recommended, it is ten chances to one that too much or too little is the result or the float is made lop-sided.

NOVICE.

Scottish Trials.—With regard to Mr. MacGregor's letter in the last issue, our representative informs us that, at the Edinburgh M.C.C. premises prior to the trials, he was handed three official lists of competitors, two by Mr. MacGregor himself. Two of them gave No. 74 as H. Berwick. In reference to the watch at Applecross there were quite a number of complaints from men who lost no marks on the section. He is quite prepared to believe the officials were correct, and the complainants wrong, but mentioned the matter as reported to him by men who had no personal bias in the affair.

A reader who was fined £8 11s. 5d. (or one month's imprisonment) for riding through Beeston at an alleged speed of 30 m.p.h. advises motor cyclists to be very careful in that neighbourhood.

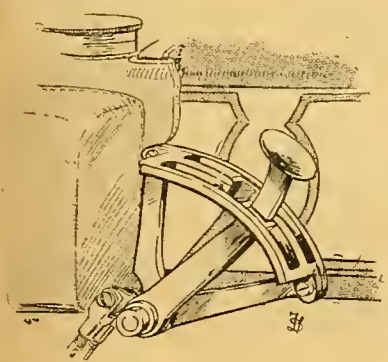
Auto Cycle Union ANNUAL SIX DAYS' TRIALS

SHEFFIELD as a CENTRE

A look round the Competing Machines. Sidecar Outfits the Most Improved. Detachable Wheels, Electric Lighting and Sidecar Brakes more common. Increased Number of Speeds.

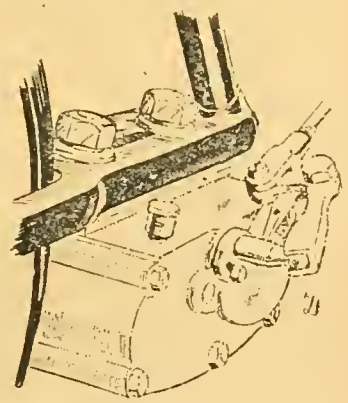
THE organisation of trials is becoming a fine art, and is an art in which Mr. T. W. Loughborough excels, as he thoroughly understands how to practise it to the best advantage. To criticise Sheffield as a centre at this early stage of the trial would be hardly fair, and it is not too early to say that it is a town which does possess certain excellent features. Being a city of no mean dimensions its hotels are good, and of these the official headquarters, which house not only the officials but a number of the competitors, are comfortable and well appointed. One official whom we are glad to see back again in England, and working for the A.C.U., is Major D. F. Nicholl, who, for the last two years, has been bewailing the paucity of motor cycles on Gibraltar's rocky heights. An innovation is the renting of a separate Auto Cycle Union office. This is situated in London Road, quite close to the storage depôt. It was an empty shop, before Mr. Loughborough furnished it, and in the windows thereof are displayed three handsome silver cups, one presented by the Sheffield motor cycle traders for the best performance by a solo rider, another given by the same body for the best performance by a sidecar rider, and the other presented by the well-known rider, Jack Haslam, for the best performance by a rider of any competing machine under 350 c.c. In the shop one of the A.C.U. staff is in attendance for the purpose of giving information, or even enrolling members, while behind there is an excellent Press room, where information is given out at the end of every day in a manner which is an improvement over last year's arrangements. Above is an office, the walls of which are covered with maps of the district, where the results are worked out.



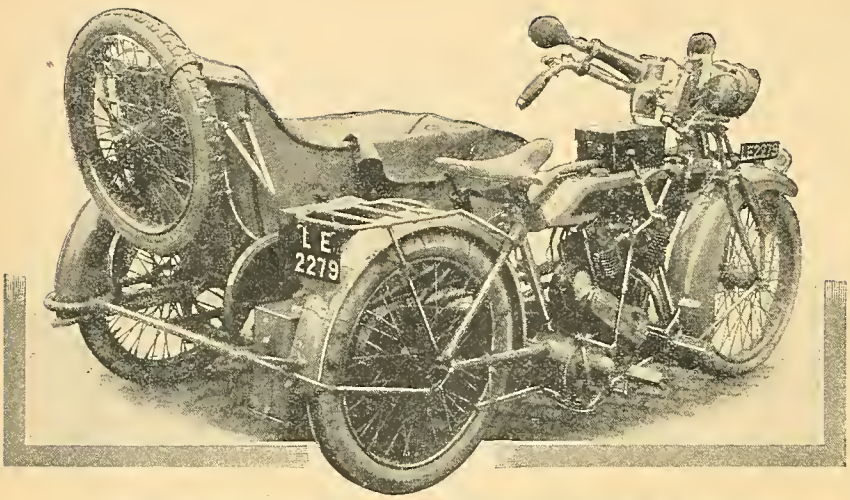
F. K. Langton's twin-cylinder Ariel is fitted with a new gate change control for the four-speed gear box

Examination and Sealing Operations.

On the morning of the 5th, as early as 9.30, there was a goodly crowd of competitors outside the Olympia skating rink in Bramall Lane. At 10 a.m. the competitors were led in a few at a time, their labels were issued and sealed on to the handle-bars. The machines were then pushed to the other end of the rink, filled up in a depot for petrol and accessories run by the Sheffield Motor Cycle Traders' Association, then taken to the Anchor brewery next door and weighed, then the drivers and passengers were weighed, and the machines were again taken to the storage depôt and placed opposite their numbers. Next the engines and gear boxes were sealed, the



Three-speed gear box and control on the O.K. Junior machines

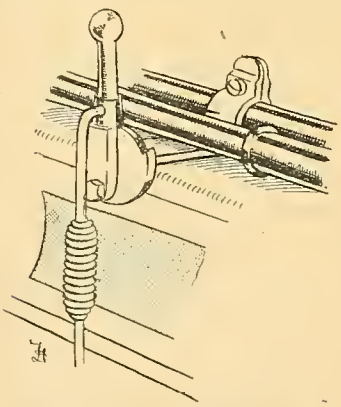


The Matchless sidecar, which is fitted with detachable and interchangeable wheels.

equipment verified, etc., and as each function was performed the official responsible placed his initial on the label, and when every duty had been carried out, one of the judges tore off the red tag at the bottom. The machines were ranged round the walls of the rink in numerical order, on thick sawdust, and a tray was placed under the crank case of each, while the twelve cycle cars and light cars were arranged in a single line down the centre of the hall.

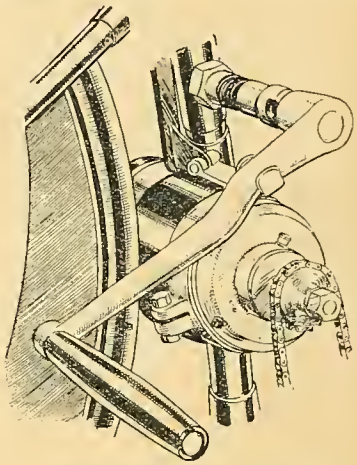
A Number of New Models.

By three o'clock there were very few absentees, and the work of the morning was almost completed. Despite the opposition to the trial raised by a section of the trade, the event is well supported, the entry is quite large enough, and most of the best makes are represented.

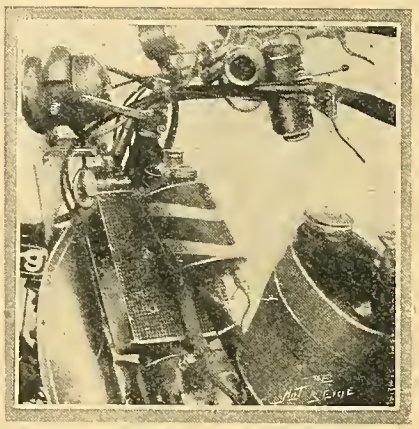


Spring control rod for the decompressor on the Overseas ridden by V. Underhill

At this stage of the industry startling features are not expected, but an examination of the machines in the Olympia rink revealed a good deal which was of interest. Langton's Ariel was fitted with a four-speed (sliding) gear box, operated by an oscillating lever working in a gate similar to that in use for many years on Daimler cars, while other noticeable features were the brake drum

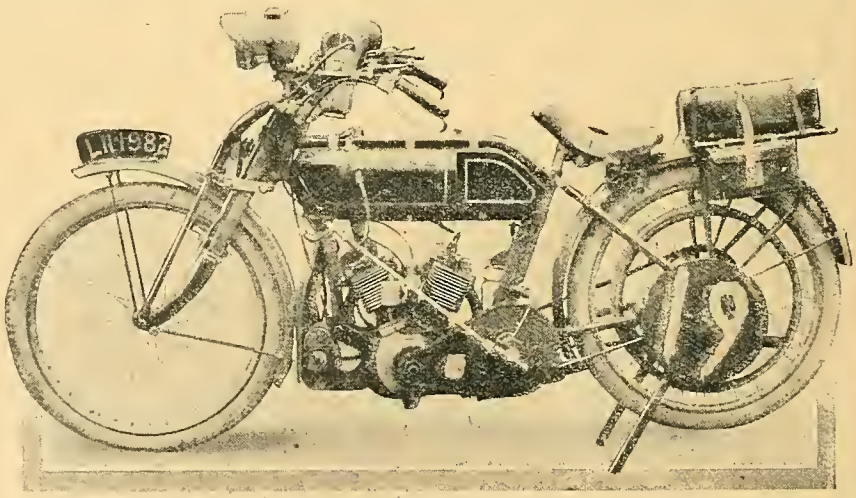


The dynamo carried on the saddle tube of the Enfields ridden by W. H. Eggington and H. Greaves.

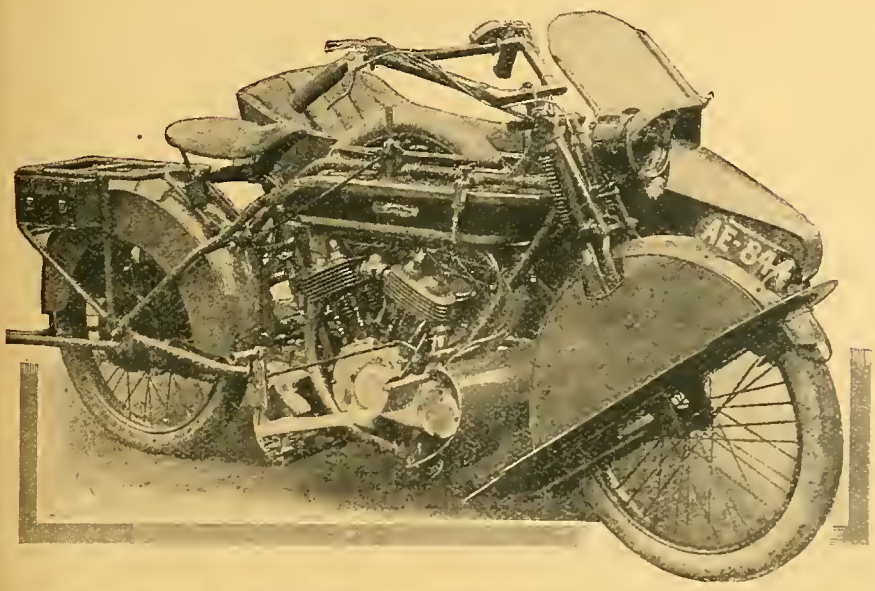


Extra tank at the front of the Scott machines.

forming part of the rear sprocket and the sensibly large filler cap on the gear box. Another machine which has not figured in many trials—at any rate in the North—was the Montgomery 5 h.p. horizontal twin. The machines in Class A (not exceeding 250 c.c.) are naturally fitted with low gears. Their makers have much confidence in the reliability of their machines to enter for such a severe test. The Dayton, the smallest engined machine, has three speeds. The N.S.U. machines in this class and in Class C are equipped with both their own two-speed engine shaft gear and the Armstrong three-speed hub, thus getting six different ratios. Motor cycles which stood out pre-eminently for their finish and general appearance were the P. and M.'s, which looked as if they were brand new, but were the same which had gone through the Scottish trials, the James, Scott, Matchless, Brown's Rover, Lea-Francis,



Gear side of the twin-cylinder Grandex Precision, fitted with Enfield two-speed counter-shaft gear and chain drive.



One of the most efficiently guarded machines in the whole of the trial is the 8h.p. Leader sidecar outfit, ridden by Eli Clark.

Clyno, Enfield, Ariel, Sunbeam, Bat, Triumph, Scott, Humber, and such well-known makes. Moffat was riding the identical machine ridden by Busby in the Tourist Trophy Race. It is fitted with an enormous petrol tank holding 2½ gallons, and had a tiny horn of the Klaxon type on the top tube, which is worth mentioning on account of its small size and nominal price. De la Hay, another Sunbeam driver, was complaining of the small size of his tank.

Praiseworthy Mudguarding.

Two machines were conspicuous owing to the pains taken to carry out the mudguarding in an adequate manner. These are Eli Clark's Leader sc. and Greaves's Enfield sc. The former is fitted with an enormous rear guard with ample side shields, so designed that by undoing the nuts securing the mudguard and carrier stays to the frame the whole can be swung back and the back tyre exposed. We saw this actually done and in a very short space of time. The front mudguard is fitted with light detachable valances, which cover half the wheel, and the front wheel and sidecar wheels are detachable and interchangeable. A large sized guard protects the magneto and transversely placed silencer, while it is interesting to note that the sidecar body is suspended on four quarter elliptical springs. Sidecars in several cases were very much on the light side, and were often dangerously near to being unsuitable for touring. The Canoelet hammock fitted to Stevens's James certainly does not look the 110 lb. it scales. From its design the passenger has always to assume a reclining position, and the same remarks apply to the sidecar on Cross's Sunbeam. Sawer's sidecar is attached to his 3½ Premier at five points, while Finch had fixed a heavy portmanteau strap to the sidecar frame and down tube as an additional precaution. Greaves's Enfield sidecar combination, to which we have alluded before this, is a most luxuriously appointed affair. The most striking feature is the front mudguard of excellent design. It is of ample dimensions, and more closely resembles a Frankonia guard than anything we have yet seen on a motor cycle.

Dynamo Lighting Sets on Sidecars.

A Lucas dynamo similar to that lately seen on Egginton's Enfield sidecar is carried in a circular bracket brazed to lugs fitted in the saddle tube. Slotted orifices allow for adjustment of the driving chain. The dynamo is driven off the gearshaft. A neat switch box is fitted to the top tube, and the equipment lights both the head and tail lamps. A sidecar brake, worked by a Bowden lever fitted to the diagonal sidecar stay, is applied to a dummy belt rim on the sidecar wheel, while the luggage grid is suspended on springs. The frame is of new design, the top tube being dropped, and so allowing a lower saddle position. Finally, a belt rim brake is fitted to the sidecar wheel.

Haslam's single-cylinder Premier possessed a light but comfortable wicker sidecar, purple in colour, and provided with a sidecar wheel brake.

A New Detachable Wheel.

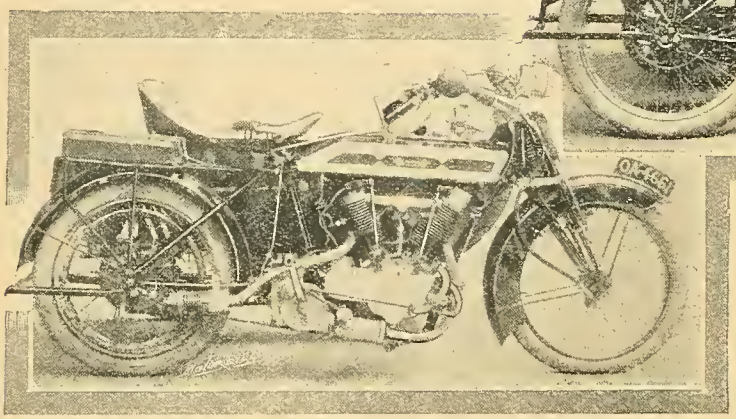
The chief innovation on the handsome and businesslike khaki coloured Matchless-M.A.G. sidecar machines is the new detachable wheel. All three wheels are interchangeable, and the chief improvement lies in the introduction of stuffing boxes to exclude grit and wet from the bearings, and the provision of a slotted distance piece in the back wheel, which allows the spindle to be inserted before the driving dogs are in engagement; this can be also inserted after the dogs have been engaged. Harcourt radiators are fitted in several cases, noticeably to Drysdale's Connaught and Chapman's 4 h.p. Triumph. White's Wolf possesses an ingenious form of gate, in which the change speed lever is disengaged by downward pressure of the hand. Cock's Clyno is provided with a large shield in front of the Senspray carburetter, while Frank Smith's sidecar combination has a neat internal expanding sidecar brake possessing compensating joints. This is the first appearance of this sidecar, but the Clyno is in other respects standard. A noteworthy feature of the spick and span P. and M.'s is the fitting of inspection doors to the chain cases, which are

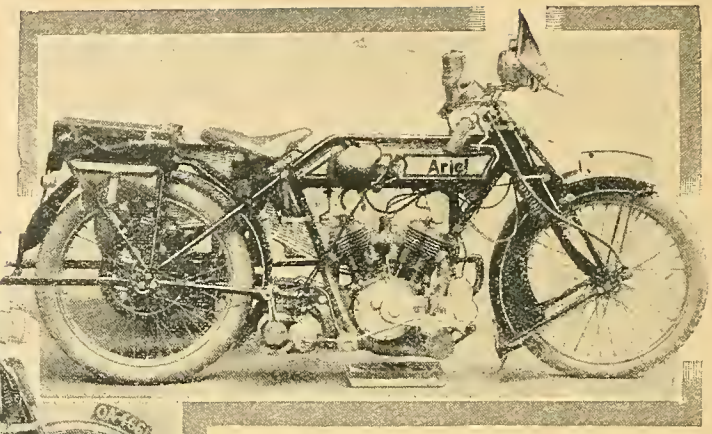
Scene in the Skating Rink, Bramall Lane, Sheffield, where the machines are stored after each day's run.

The A.C.U. Six Days Trial.—

made like the cover on a magneto contact breaker and kept in place in a similar manner. Phillips's Douglas has a metal plate attached to the front stand, so that the latter, when out of use, acts as a mud shield; an efficient belt guard is also fitted.

Tom Silver's 7-9 h.p. Quadrant sidecar outfit has a three-speed gear box in the counter-shaft, and a shield to the overhead valve gear. Among those who make





(1) Valve side of the 7-9 h.p. Quadrant.
(2) The three-speed twin-cylinder Ariel. Underneath will be seen a bath to catch any oil from the engine. One of these tins is supplied to each competitor.

their *début* in an A.C.U. trial are the American Excelsior sc., which has a two-speed-epicyclic gear and a Binks carburetter, and the Wellington and Burford solo machines, which present no striking departure from standard practice, while the latter is a sensibly designed mount. The large Best and Lloyd lubricator, first seen in the Isle of Man, is fitted to Collier's Grandex and to other machines in the trial.

The Cycle Cars.

There are thirteen cycle cars, ranging from W. D. Hawke's Victor-Precision (the only belt driver) to the miniature cars, such as the four-cylinder Morris-Oxford, Calthorpe, and the pair of A.C.'s with their polished aluminium wind-cutting bodies. Morgans are the most popular, H. F. S. Morgan's four-speeder having what appears to be an air-cooled motor, but which has the engine and radiator neatly covered in. The J.B.S. has four gears also, and is driven by a twin-cylinder Blumfield engine. On Millar's Humberette a car type Smith carburetter with warming jacket is fitted with a beneficial effect in consumption, we are told. The Gordon is the same that Armstrong, its maker, has used in several trials of late.

Altogether the machines—solo, sidecars, and cycle cars alike—present quite the most workmanlike and well-finished set of machines we can remember to have seen presented for competition in a Six Days Trial.

NOTES.

The Sheffield-Simplex car, which will lay dye along the course, left on Saturday. Arrows also are being used at doubtful corners.

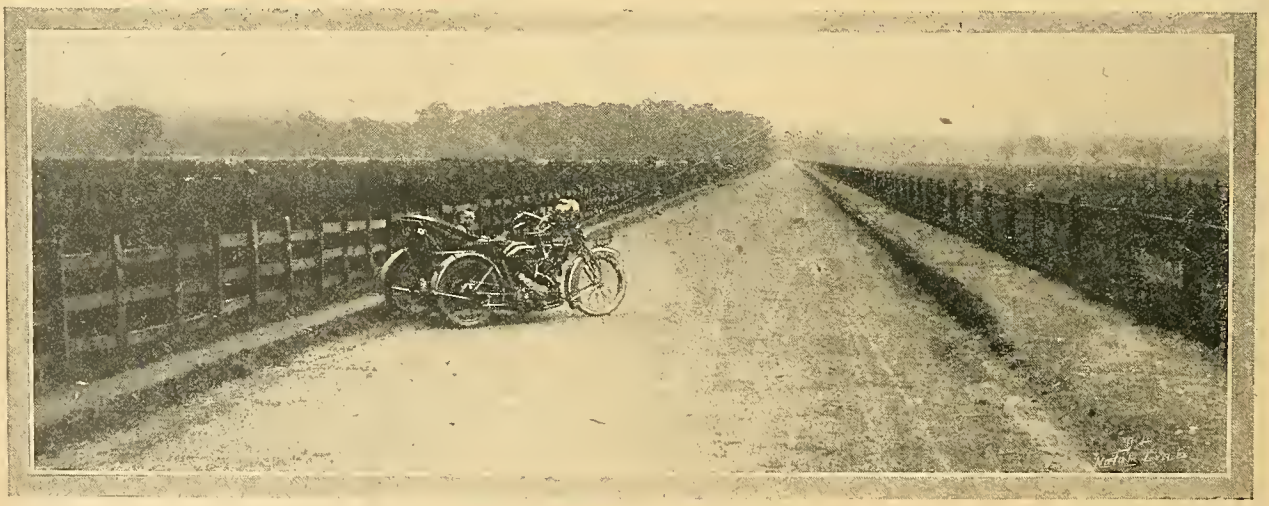
Five of the twenty-five paid observers appointed by the Auto-Cycle Union failed to report themselves at the appointed time on Sunday, which did not lessen the difficulties of the organising body. However, five substitutes were soon pressed into service.

J. S. Holroyd, who has been associated with the Motosacoche Company for some time, is riding a Blackburne in this week's event.

The Triumphs have a new tank finish in slate colour and stove enamelled. It looks, if anything, smarter than the aluminium formerly used, and should certainly be more lasting.

There are not many new designs in the trial, due probably to the fact of seven leading firms being unrepresented officially.

The O.K. Juniors are seen for the first time with three-speed counter-shaft gears.



The road on which the speed test was held on Wednesday. A lunch stop of three hours was made for this purpose

AN ADVENTUROUS FIRST DAY.

132 STARTERS—111 SURVIVORS.

MONDAY'S ROUTE: 137½ Miles. Sheffield, Stoney Middleton, Monsal Dale, Littonstack, Cowdale, Congleton, Biddulph, Rudyard (lunch), Leek, Wirksworth, Matlock, Bakewell, Curbar, Holmesfield, Sheffield.

THE sky was overcast on Monday when the competitors were allowed into the storage hall one by one to bring forth their machines for the official start. Prompt at 8 a.m. E. B. Glissan, on a 6 h.p. Rex sidette, who carried No. 1, and was incidentally taking part in his first competition, led off the ball, and one by one the others, numbering 132 all told, followed on what proved to be an adventurous day. First it rained, and in the very earliest stages a five mile stretch of moorland track was traversed which would put any section of similar length in Scotland in the shade; then followed a most tricky descent of Jacob's Ladder, where a cycle car overturned, then a hill, the surface of which was so loose and bad that the competitors thus early talked of "striking" once again, hairpins which no cycle car could negotiate without reversing, and a succession of appalling gradients and rock-strewn bye-roads, which must tell their tale before the week is out. Those competitors with Scottish Trials experience confess that they have never known so much in the way of hills and freakish surfaces crammed into one day, and on Monday evening many riders were complaining of stiffness and saddle-soreness.

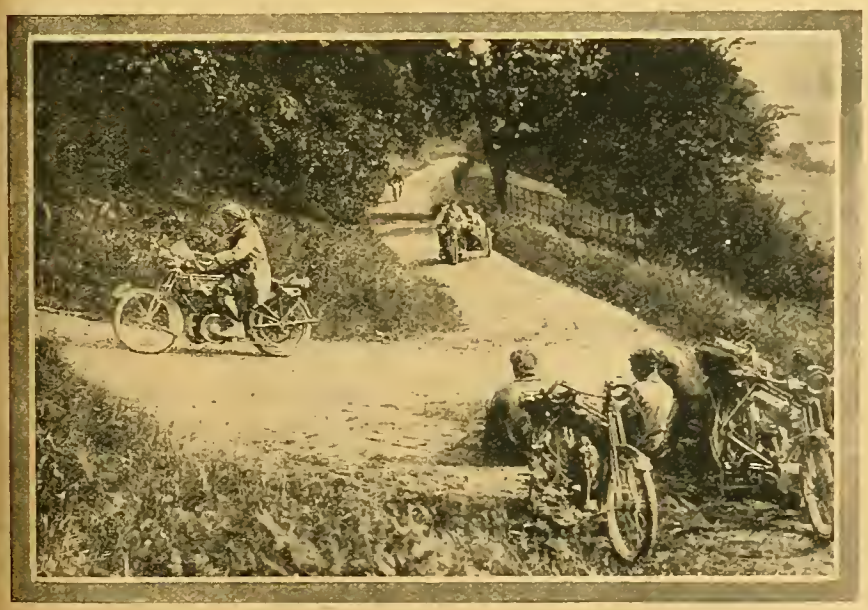
The Early Stages.

To revert to the start. F. J. Watson, who had returned to Birmingham by road on Sunday in order to get a new piston, succeeded, by dint of riding all through the night, in getting back to time, and his machine was duly weighed at 3 cwt. 2 qr. 22 lb., and on the starting line at the appointed time.

A general melee on Littonstack on Monday last. In the background may be seen the steep descent to the foot of the hill.

J. L. Norton had engine trouble on his way to Sheffield, and changed his engine for one owned by a local rider. Even before reaching the outskirts of Sheffield there was quite a useful climb, but this was nothing to what followed. Near Hathersage a score or so of competitors went astray, but soon regained the proper route. The upper portion of Sir William Hill proved a teaser, but Stoney Middleton tried the competitors more severely, and here several came to a standstill. G. W. Wilkin (2¾ Levis) came up the top part really fast, and Finch (3½ Premier sc.) made an extraordinarily fine climb for a 3½ sidecar outfit. Many suffered from rear wheel slip on the last of the bad bends, of which there were three, and the rough surface caused more than one failure. Glissan had had trouble with one cylinder and arrived late, but made a good ascent of the upper part. One of the features of the climb was the excellent show put up by the cycle cars, and Gordon Armstrong (8 Gordon) in particular made a fine, steady climb. The A.C.'s were as fast as any. R. Ellis (Morgan) came up with a roar. G. D. Hardee and C. R. Collier (7 Matchless sc.) performed well, but both suffered from rear wheel slip. N. G. Downs (2½ New Imperial) had a bad skid, but recovered finely, but F. G. Edmond (3½ Humber) hit a stone and came off, though he had plenty of power in hand. H. F. Edwards (Bat) was badly baulked, but saved himself by magnificent riding. Millar made a fine climb and did his best to avoid baulking, but the surface was so unpromising that he was forced on to the better part. K. E. Don (5 Zenith) made a fine climb, but broke his frame near the top of the hill and had to retire. Greaves on the 8 Enfield, did not seem so happy as he usually is on the 6 h.p., and joined the large band who received outside assistance. Most of the lightweights were in good form, and N. Hall (O.K.) shone in particular. Victor Garland (Williamson sc.) retired owing to the gear box bolts coming adrift.

Previous to this hill the descent of Jacob's Ladder was a nightmare. We followed a Morgan with its back wheel locked slithering down crabwise. The



R. G. Fenner (3½ h.p. Blackburne), J. Haslam (3½ h.p. Premier sidecar), and a Sunbeam rider rounding the foot of Station Hill, Bakewell

The A.C.U. Six Days' Trial.—

Morris-Oxford c.c. got out of hand, ran up the bank, and turned over, fortunately without damage. Hereabouts Longson, on the American Excelsior, retired with a broken sidecar connection.

Dropping down Monsal Dale Hill, a rather stiff climb followed on a stony and rutty surface, and we passed Gregson, whose hub gear had given out on his twin Bat, which otherwise was going excellently.

A Revival of Blea Tarn in Lakeland.

Further on, at Littonstack, which hill was not included in a non-stop section, there was a sight to be remembered, for competitors were literally strewn all the way up the road, and some of the machines were belching forth clouds of blue smoke. When Littonstack was selected the surface was passably good, though the gradient is really severe, approaching 1 in 3 at the top. But recent heavy rains rendered the surface almost impossible, and consequently the vast majority stopped, though it should be added that many failures were due to baulking on the narrow road, which is the worst feature of the whole affair. A number, however, did make clean climbs, including F. C. North (Ariel), Clayton and Westwood on Triumphs, Baker (Scott), Applebee, sen. (Motosacoche), Oliphant (Premier), and others. Ellis (Morgan) made an excellent ascent, but in turning into the narrow gateway at the top his front wheel lifted, and the machine charged the gatepost, smashing the screen to atoms and cutting the driver's hand, but he pluckily continued. Lower down the hill Sawer's Premier sidecar turned completely over without injury, and Stevens on the James sidecar did practically the same thing, the sidecar wheel being buckled. He sent for a new one, and continued rather late.

Major Lindsay Lloyd now appeared at the hill foot, and as soon as he saw what was going on decided there and then to allow those riders who preferred it to proceed by another route, so that those who had churned their back tyres and strained clutches and gears in getting over the hill are to be condoled with. Hugh Gibson elected to make an attempt, and with Gregson on the carrier made one of the best climbs. Heinzel, whose six-speed 2 h.p. N.S.U. is going magnificently, ran off the road, charged through a bunch of nettles, and was off down the hill in no time, to the amusement of the crowd.

A Troublesome Hairpin.

After joining the Buxton road the route suddenly doubled back upon itself up Kingsterndale, and the hairpin at the foot caused about twenty failures, none of the cycle cars we saw being able to negotiate the turn, and even motor cyclists charging the bank or having to foot-slog to keep going. Hereabouts Glissan (Rex Sidette) retired owing to bent tappets, and Edwards (Sparkbrook sc.) also gave up, as his low gear refused to engage. Other withdrawals were Chinn (Wolf), who experienced trouble with his gear, and Sproston, who broke a chain on his Lea-Francis.

Cloud, Mow Cop, and Barley's Hill were the only other ascents worthy of mention before the luncheon stop at Rudyard Lake. Here 118 competitors arrived. Tom Silver elected to retire, as his knee began to give him pain. It will be recalled that he suffered a bad fall in the Scottish Trials. J. W. Woodhouse took his place on the Quadrant sidecar, withdrawing the solo mount he had ridden up to that point. Sawer (Premier sc.) and Moston also retired at Rudyard, leaving 115 in the trial.

The afternoon trip promised to be quite as exciting, as there was a succession of steep climbs over surfaces which could not be described as good, bad, or indifferent; in most cases there were Colonial tracks, and evidently the A.C.U. was very little disturbed by the strike which was occasioned last year, for Monday's route surely was the most severe the A.C.U. has ever planned.

A good road out of Leek was followed for about four miles, but a sudden left-handed turn led to a long steep climb with a very stony surface. After the village of Ford an orchard with a mud surface had to be traversed on a fair up grade, and a long drop through a very narrow lane followed after leaving Grindon. At the foot of the hill lies a level crossing, and this marked the termination of the non-stop section. This was fortunate for many as the subsequent long climb up a grass-grown track, including three hairpins, caused the large majority of passenger machines to come to a standstill through rear wheel slip. The early arrivals had a great advantage, as the surface was passable until the sidecars and cycle cars arrived and churned deep ruts all over the road. Baulking was the rule rather than the exception, and the first hairpin became so congested that it was impossible to observe, and a clearance was only effected by the aid of much outside assistance, which was cheerfully given by a number of local sportsmen.

Hugh Gibson (Clyno sidecar), J. Drew (2½ h.p. New Imperial), W. G. Ayling (1½ h.p. Dayton), and A. F. Plint (1½ h.p. Dayton) at the hairpin bend on Littonstack.

Excellent Performances on Green Hill.

The villagers turned out in force to see the riders perform on Green Hill, Wirksworth, which ascent was in a much worse condition than we have ever seen it, due to heavy rains. But the performances here were very good indeed; even the lightweights making clean ascents of this 1 in 4 gradient. Wilkin on a Levis led, his engine emitting a fine healthy purr; Walters (P. and M.) simply toyed with the climb. May (2¾ A.J.S.) followed in good style, though he grazed the wall. Taylor (New

The terrific gradient and appalling surface of Littonstack—a road unfit for touring machines—caused a number of failures. Valuable assistance was rendered by the sporting onlookers in assisting competitors.

Imperial) helped with his foot, whilst Williams (Wellington) dismounted. Brownsort (A.C.), Kerr (N.S.U.), and Langton (Ariel sc.) went up in close company in excellent style, followed by Phillips (Douglas), Smith (Clyno sc.), Robinson (N.U.T.), Tubb (Humber), Noakes (Sunbeam), young Montgomery (on the horizontal twin), and Drysdale (Connaught), who made no mistake. Creak Davis stormed the gradient on his Chater-Lea sc. Dixon (James) was baulked by a boy, but restarted and went up well. Heinzel was applauded as he steadily picked his path to the summit on the diminutive N.S.U. Francis (Lea-Francis), Finch (3½ Premier sc.), and Stevens (6 A.J.S. sc.) were among the best.

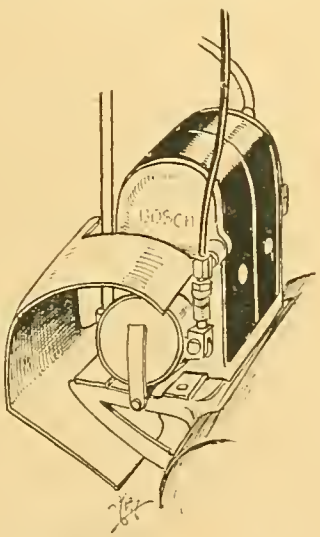
Matlock Bank Proves Easy.

Through Matlock Bath the famous bank was included, but the competitors paid little heed to 1 in 5 gradients of this kind after what they had already experienced. Scott (A.C. cycle car) passed us going well, though he had broken the lower leaf of his front spring.

A glimpse of Haddon Hall and Bakewell hove in sight, the moderately steep climb over the station bridge being included. We saw no failures here, but we noticed Pearson's two-stroke Clyno make yet another impressive ascent. Incidentally his companion, A. G. Cocks, had a bad fall near Buxton and retired. Curbar was more difficult owing to the loose and bumpy surface.

By this time the riders were saddle sore, and many a rim showed the effect of the gruelling it had received. The timekeeper was stationed on the outskirts of Sheffield, and just previously the competitors had descended at a crawl a hill which really has no surface, which was to form the first test on Tuesday. Entering the city, Applebee senior unfortunately knocked down a man who walked into his front wheel—and, incidentally, it is astonishing how the Sheffield folk wander aimlessly about the roads without a thought as to traffic.

One hundred and eleven competitors were duly checked into the garage on Monday night, so that if the average of twenty-one retirements is maintained throughout the week there will be few competitors left on Saturday. Many of those who did finish lost marks.

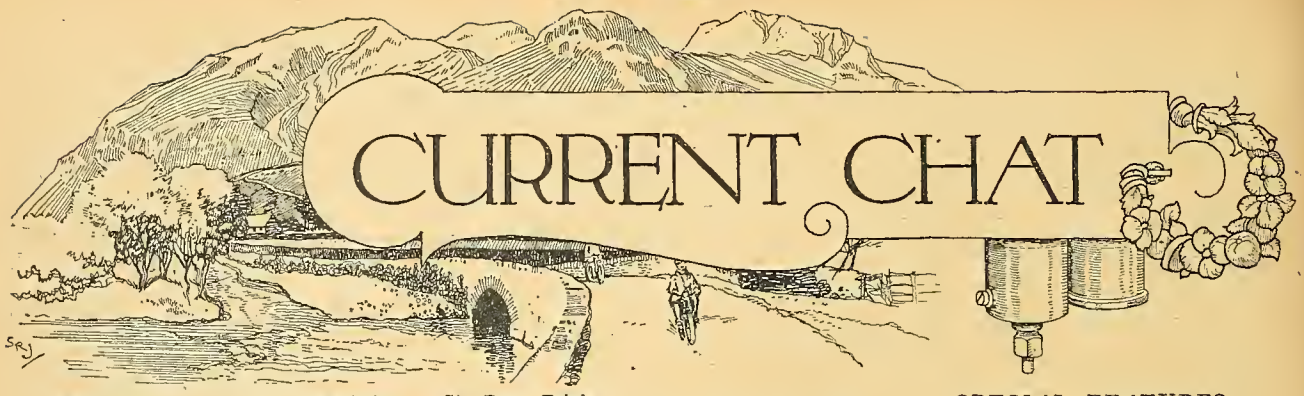


Shield over the Magneto on W. Westwood's, 4 h.p. Triumph

TUESDAY'S ROUTE: 126 Miles. Sheffield, Bakewell, Matlock, Wirksworth, Leek, Rudyard (lunch), Wincle, Cowdale, Stoney Middleton, Hathersage, Sheffield.

Tuesday opened fine, the roads being in excellent condition, and on the outskirts of Sheffield the first hill was encountered; it was short, steep, and rough, and accounted for quite a number of failures. Nott missed the moorland track, and had to scorch back. The road leading to Curbar was exceedingly bad, and the competitors preferred to ride on the grass at the roadside. The next incident was the precarious descent of Grindon, and on the corresponding ascent Walters (3½ P. and M.) led, making an easy climb, but Wilkin (2¾ Levis) nearly fell changing gear in a deep rut. Langton (5 Ariel) made a splendid climb, as did all the Ariels, but May (2¾ A.J.S.) missed gear on the corner, and restarted easily. He had previously charged a wall in a non-stop section, as Chapman had also done. Splendid ascents were achieved by Haddock (2¾ A.J.S.), Kerr (3½ N.S.U.), North (4 Triumph), Robinson (3½ N.U.T.), Davis Smith (4½ B.A.T.), Nott (5-6 Clyno sc.), Stevens (4¼ James sc.), Tubb (3½ Humber), Westwood (4 Triumph), Clayton (4 Triumph), Applebee (3½ Motosacoche), and Drysdale (2½ Connaught).

Flint made a wonderful climb, and Ball, Gibb, and Finch did well, as did C. R. Collier on the big Matchless sc., and Ellis Dixon. There were instances of poor cornering, but Morgan made no mistake, nor did Newey (3½ Ariel), Cook (5 A.S.L.), Allday (3½ James), Williams (6 A.J.S. sc.), Holroyd (3½ Blackburne), Haslam (3½ Premier), and Hawkes (10 Victor c.c.). Owing to pulling a cover off, Tecton was late, and Hardee stopped on the corner with a choked jet.



TIMES TO LIGHT LAMPS.

July	9	... ...	9.14 p.m.
,,	11	... ...	9.13 p.m.
,,	13	... ...	9.11 p.m.
,,	15	... ...	9.9 p.m.

Bank Holiday Races.

Two handicaps for motor cycles are included in the programme at Brooklands on August Bank Holiday. These are both for all classes of motor cycles, over 5¾ and 8½ miles respectively.

Stolen Motor Cycle and Sidecar.

A 4 h.p. 1914 Triumph, engine No. 30,472, and Gloria cane bodied sidecar, No. 590,619, was stolen by means of a worthless cheque from W. Nixon, Brampton, Cumberland, last week. Anyone meeting with this machine is requested to communicate with the Brampton police. Our deposit system is devised to prevent frauds of this kind.

A North-country Speed Test.

The class winners of the Westmorland Motor Cycle Club's speed trials at Underby were as follow: Lightweights, W. Heaton (2¾ A.J.S.) Machines up to 560 c.c., R. Bownass (3½ N.U.T.) Up to 1,000 c.c., R. Bownass (3½ N.U.T.) Sidecar machines (any capacity, on formula), H. Taylor (6 Bradbury sc.) Bownass's performance in the 1,000 c.c. class is worthy of special notice.

A Light Car Rally.

The Midland Light Car Club are organising an open rally for Saturday, July 11th. The meet is to be at the top of Fish Hill, Broadway, an almost ideal spot for the event, as it is situated in beautiful country with a wide selection of hills in the neighbourhood for those who wish to test the climbing powers of their machines, while the roads are good.

Speed and Consistency.

Very high speeds were attained at the Colwyn Bay Speed Trials last Saturday, C. R. Collier on the 7 h.p. eight-valve Matchless attaining a speed of 87.38 miles an hour for the flying half mile and winning seven first prizes. Amongst the sidecar classes Kenneth Holden won the kilometre standing start for passenger machines up to 500 c.c. and the same for 750 c.c. as well as the flying half mile for 750 c.c. and 500 c.c. passenger machines. The A.J.S. firm also take a large share of the credit, taking first, second, and third in three classes, in one case C. Williams on a 2¾ h.p. machine attained a speed of 63.38 miles an hour.

Six Days Trials.

As in the case of other important trials, *The Motor Cycle* provides its readers with the first details and illustrations of the early stages of the A.C.U. Six Days Trials which finish to-morrow (Friday) at Sheffield. A continuation of the report will appear in our next issue written by members of our staff who are following the competitors throughout the week on motor bicycles.

Error in Programmes.

That any mistakes occurred in the official programme of the Scottish Six Days Trials was due to the entrants themselves wrongly describing the fittings on their machines in the entry forms, and, therefore, no blame can attach to the Edinburgh and District M.C., writes Mr. Campbell McGregor.

Road Racing in Italy.

Motor cycle road racing is gaining a great hold on the Continent, and the latest important event was the Grand Prix of Turin just decided. There were thirty-seven entries, sixteen in the 350 c.c. class and twenty-one in the 500 c.c. class. The latter was won by Malvisi on a Motosacoche, Della Ferrera machines being second and third, while the winner in the smaller class was Musso on a Della Ferrera, B. Badino, on a Douglas, being second, and making the fastest lap in the 100 kilometre race, at an average speed for the lap of 50 m.p.h.

SPECIAL FEATURES.

THE A.C.U. SIX DAYS TRIALS.

Exclusive Illustrations and Descriptive Report.

STY HEAD PASS CONQUERED.

Shorter Trials Routes.

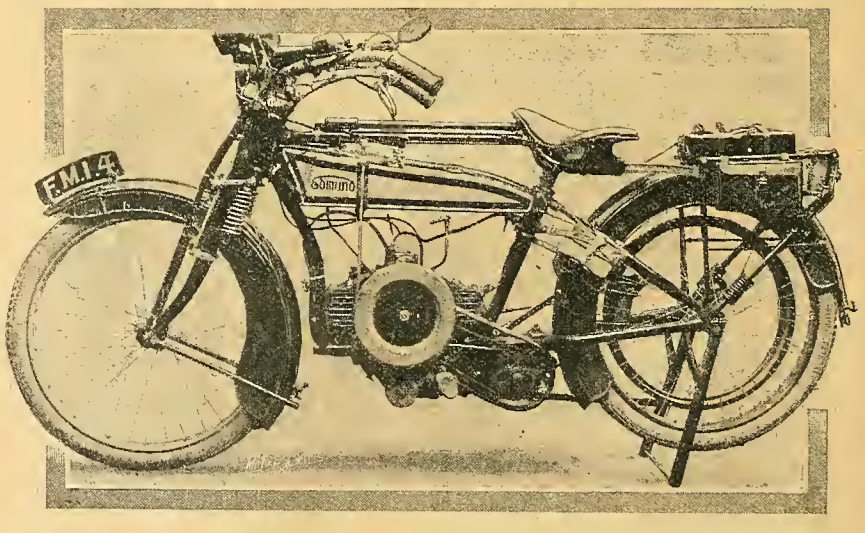
The daily routes for the A.C.U. Six Days Trials are much shorter this year, and competitors much appreciate the earlier return to the riding centre.

Military Motor Cyclists.

Several motor cyclists are required by the War Office to act as despatch riders on 28th July to 8th August next, and also on 3rd August to 8th August. Any riders desirous of serving in this capacity should communicate direct with the Secretary of the Auto-Cycle Union, 83, Pall Mall, London, S.W.

A Midland Trial for Cycle Cars.

A class for 1,000 c.c. cycle cars is included in the regulations for the Coventry and Warwickshire Motor Club's open trial for cycle cars and light cars to be held on Saturday, July 25th. Other classes are for vehicles with engines up to 750 c.c. to 1,100 c.c., no weight limit. Acceleration, easy engine starting, and ability to re-start on a gradient are the three tests included.



An Edmund spring frame machine fitted with 2¾ h.p. Douglas engine and two-speed gear

FUTURE EVENTS.

July 18.—Liverpool Amateur M.C.C. Open Trial.

July 18.—M.C.C. Members' Meeting at Brooklands.

July 18.—Midland Light Car Club Open Efficiency Trial.

July 25.—Streatham and District M.C.C Open Hill-climb.

July 25.—Coventry and Warwickshire M.C. Light Car and Cycle Car Open Trial.

July 25 B.M.C R.C. Race Meeting

Aug. 3-9.—F.I.C.M. INTERNATIONAL SIX DAYS TRIALS. Grenoble as a centre.

Aug. 15.—Essex M.C. Race Meeting at Brooklands.

Sept. 6-9.—ANGLO-DUTCH TRIAL IN HOLLAND

1,000 c.c. Cycle Cars in the Six Days Trial.

Five of the thirteen cycle cars in the Six Days Trials have engines under 1,000 c.c.

Next Week's Trials Report.

Next week's issue of *The Motor Cycle* will contain a detailed description of this week's Six Days Trials, written and illustrated by our own staff, who are accompanying the competitors daily on motor cycles.

Irish Trial Results.

W. J. Henderson (5-6 Rudge) proved the winner of the Rudge-Whitworth Cup and the Manthorpe Cup in the open twenty-four hours Irish trial described in last week's issue of this journal. Second and third prizes fell to riders of 3½ Rovers in the persons of G. Roche and J. Browne.

Two-stroke and Lightweight Number.

July 23rd is the date of the above special number of *The Motor Cycle*, which, as its name implies, will be devoted mainly to articles on the subject of two-stroke engines and lightweight machines of about 300 c.c. capacity. Well-known experienced writers will deal with the subject in articles appealing to all tastes.

Racing Comparison.

In comparing the results of the Johannesburg-Durban race, won by B. Adams on a Rudge-Multi at a speed of 37 m.p.h., with the T.T. race in the Isle of Man, a writer in the *Sunday Times* of Johannesburg actually gives it as his opinion that of the two performances he considers Adams's far and away the more remarkable. The distance of the Rand race was 415 miles.

A Daylight Saving Climb.

Quite a new note in hill-climbs will be struck by the Sutton Coldfield and Mid-Warwickshire A.C. on Monday, July 27th, when this club will hold a hill-climb open to motor cycles, sidecars, cycle cars, and cars, starting at 5 a.m.! Two club trophies will be run for, and, given a fine summer morning, we can imagine nothing more delightful than a climb such as this. It gives the man who cannot compete on a Saturday because his half-holiday is on a Thursday a chance of picking up one of those much sought after but elusive medals, and afterwards presenting himself at business with it on his watch chain—perhaps!

A World-wide Circulation.

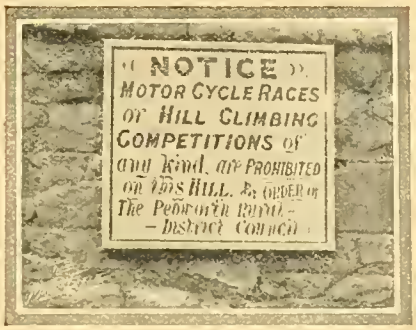
Letters from correspondents in such divergent places as Munich, Magui in Burmah, and Geneva appear in this week's "Letters to the Editor."

The International Six Days Trial.

Entries for the International Six Days Trial close on Saturday next at ordinary fees, and should be sent to M. le Secrétaire, Commission Sportive, Automobile Club de France, 8, Place de la Concorde, Paris. A strong English contingent is expected to go over to Grenoble, comprising such well-known riders as Frank Smith, C. R. Collier, F. May, W. F. Newsome, T. C. de la Hay, H. V. Colver, P. S. Brady, J. Gregson, F. Dover, F. L. Bassett, J. Wodehouse, etc. All those who intend to compete should at once communicate with the A.C.U. regarding their international passes and travelling arrangements.

The Grand Prix: A Contrast.

The contrast between the flourishing state of the motor cycle pastime in England as compared with France was shown up in a remarkable manner at Lyons on Saturday last on the occasion of the French Grand Prix car race. Never before in the whole history of the motor movement has such a tremendous collection of cars been gathered together so that their occupants might witness the race. On the other hand, only a dozen or two motor cyclists were observed, and the whole get up of both riders and machines contrasted most unfavourably with the spick and span outfits we are accustomed to see in this country. The race for the Grand Prix resulted in a sweeping victory for the German Mercédès cars, and our contemporary, *The Autocar*, in the issue for Saturday, July 11th (published to-morrow), will present to its readers what is undoubtedly the fullest, best written, and most completely illustrated report of this race to be obtained anywhere.



The notice board, which has recently been placed at the foot of Willersey Hill, prohibiting "motor cycle races or hill-climbing competitions of any kind." It will be interesting to see if this can strictly be enforced, provided the legal limit be adhered to.

The New Twin Rudge.

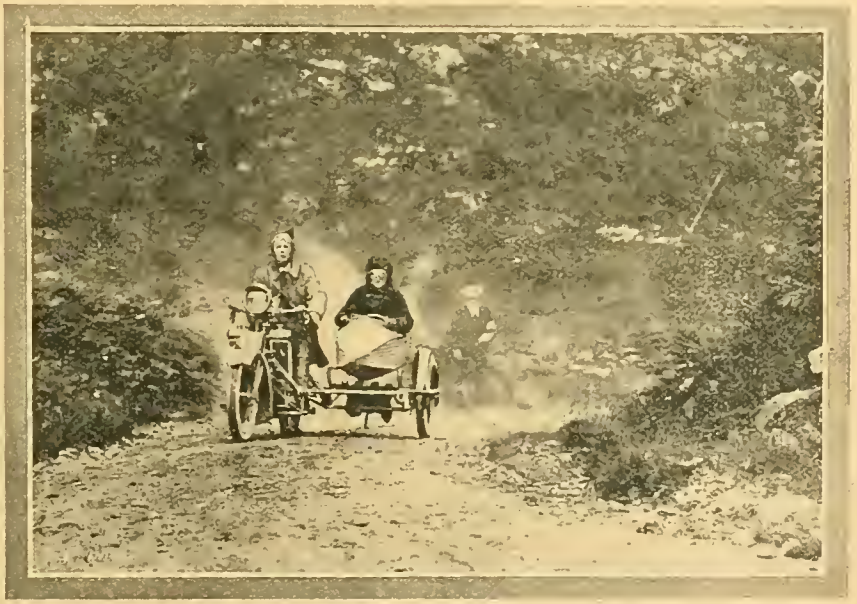
Five hundred twin-cylinder Rudge engines, similar to that described and illustrated exclusively in the last issue of this journal, have been put in hand.

Speed up Hill.

In accomplishing the fastest time of the day at the Caerphilly hill-climb, and beating all the cars in that event, C. T. Newsome averaged 39.14 m.p.h. on his Rover. The performance is all the more noteworthy as Newsome has made fastest time three years in succession.

Motor Cycles for Colonial Officials.

We learn from one of the P.W.D. officials in Nigeria, West Africa, that it is the intention of the Government to equip the Public Works Department officials in Nigeria with motor cycles and sidecars in 1915. It is evident that the authorities intend to undertake a vigorous campaign of road making, as at present they are very bad.



THE GLASGOW M.C.C. TWELVE HOURS TRIAL.
D. S. Alexander (8 h.p. Williamson sidecar) on one of the bends of Glen Finart.

SPEED TRIALS IN NORTH WALES.

High Speeds on the Promenade at Colwyn Bay at Mersey M.C. Trials.

Scene at the start, showing cars returning after the finish of their class, while motor cycle competitors are lined up for the next class. A white line will be noticed down the centre of the road to afford competitors a better chance of keeping to their own side of the road.

AN atmosphere laden with burnt gases and oil hung over the Colwyn Bay Promenade on Saturday last on the occasion of the Mersey Club's annual speed trials, which attracted an entry of 500, the greater portion being motor cycles. The track itself might well have been wider, but the surface was admirable for the racing. Competitors were despatched in half-minute intervals, the times being taken by means of synchronised watches.

C. R. Collier was riding a 3½ h.p. overhead valve Matchless, as well as the 7 h.p. eight-valve machine, on which he made fastest time of the day of 20⅗s. for the half mile (flying start)—speed, 83.8 m.p.h. The Campion sc. ridden to victory by S. Briggs in Classes 10 and 23 had a plated finish, which was quite dazzling.

An incident which marred the proceedings for a short time was a spill in Class 7 by W. J. MacConnachie (3½ Triumph). When nearing the finish the front tyre blew off, and the rider was thrown, but did not sustain any severe injuries. Confusion reigned, as the other competitors were coming up the course, and J. M. Ritchie (Rudge) fouled the footrest of Carryer's Royal Ruby, with the result that both were thrown clear of their machines, the former having later on to be taken to the hospital. However, next day Ritchie was reported to be progressing very favonrably.

H. Hall (Rudge) stopped near the finishing point in the same class with ignition trouble. In Class 10 F. C. Topham had the front cylinder head blown off his 8 h.p. J.A.P., but finished the course with one cylinder firing.

Timekeeper's Telephone Breakdown.

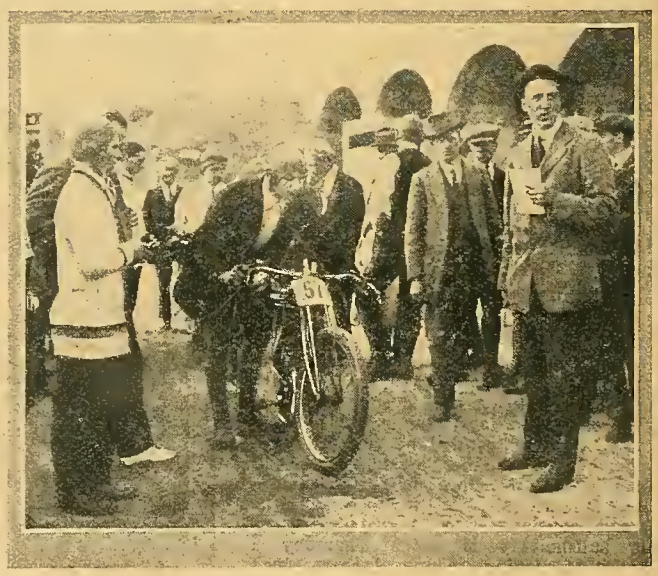
From now onwards no results were posted up on the board, as the telephone arrangements broke down, and so no times could be verified until later in the day. After each event one of the officials travelled down the course on a car announcing the end of the class and what class was to follow.

A protest was lodged in Classes 1 and 14 against the published dimensions of the New Imperial engine. This matter, however, is being handed over to the A.C.U. for the engine measurements to be officially checked.

The exhaust of the Sunbeams was noticeably quieter than any other machines.

Class 13, open to residents of twelve months or more in North Wales, for the North Wales Championship, was won by R. F. James, riding a 3½ N.S.U.

Just past the finishing line a foothridge had been erected over the course to allow the spectators to view the racing from either side of the road. Incidentally, the bridge itself proved a good point of vantage, as from here practically the whole course could be seen at once, as well as the pull up, which extended a distance of some 800 yards.



E. F. Baxter (8 h.p. Rex) on the starting line in Class 18 for solo machines up to 1000 c.c. capacity.

Speed Trials in North Wales.—

The provisional list of results, subject to confirmation by the Club Committee, is as follows :

CLASS II.—ONE KILOMETRE STANDING START (Solo Machines up to 350 c.c.)—1, W. Heaton (2¾ A.J.S.), 44s., speed 50.84 m.p.h. ; 2, C. Williams (2¾ A.J.S.), 44⅘s. ; 3, W. Stevens (2¾ A.J.S.), 45s. First amateur, T. N. Stubbs (Douglas), 48⅘s., speed 46.22 m.p.h.

CLASS A.—ONE KILOMETRE STANDING START (Solo Machines up to 200 c.c.)—1, B. Norris (2 O.K.), 62s., speed 36.08 m.p.h. ; 2, G. A. Radley (2 O.K.) 62⅕s. ; 3, W. H. Butterfield (2 Levis), 62⅘s.

CLASS III.—ONE KILOMETRE STANDING START (500 c.c.)—1, C. R. Collier (3½ Matchless), 39⅕s., speed 57.07 m.p.h. ; 2, H. V. Colver (3½ Matchless), 41⅘s. ; 3, H. Riddell (3½ Ivy), 42¼s. First amateur, V. E. Horsman (3 Singer), 44⅘s., speed 50.38 m.p.h.

CLASS I.—ONE KILOMETRE STANDING START (Solo Machines up to 275 c.c.)—1, O. Wade (2½ New Imperial), 57s., speed 39.24 m.p.h. ; 2, G. A. Radley (2 O.K.), 60⅕s. ; 3, R. E. Grice (2½ Ixion), 62s.

CLASS IV.—ONE KILOMETRE STANDING START (Solo Machines up to 750 c.c.)—1, C. R. Collier (3½ Matchless), 38⅘s., speed 58.25 m.p.h. ; 2, H. V. Colver (3½ Matchless), 40⅘s. ; 3, H. G. Dixon (3½ James), 41⅘s. First amateur, J. H. Fox (5 Matchless), 43⅘s., speed 51.54 m.p.h.

CLASS V.—ONE KILOMETRE STANDING START (Solo Machines up to 1,000 c.c.)—1, C. R. Collier (7 Matchless), 35⅘s., speed 62.84 m.p.h. ; 2, J. J. Cookson (7 Matchless), 38⅕s. ; 3, H. Reed (8 Dot) and *A. J. Brewin (8 Zenith), 38⅘s. *First amateur.

CLASS VI.—ONE KILOMETRE STANDING START (T.T. Machines up to 350 c.c.)—1, C. Williams (2¾ A.J.S.), 41⅕s., speed 53.52 m.p.h. ; 2, *E. Hart (2¾ A.J.S.) and W. Stevens (2¾ A.J.S.), 42⅘s. *First amateur.

CLASS VII.—ONE KILOMETRE STANDING START (T.T. Machines up to 500 c.c.)—1, C. R. Collier (3½ Matchless), 39⅕s., speed 56.20 m.p.h. ; 2, H. G. Dixon (3½ James), 41⅘s. ; 3, T. Harrison (3½ Triumph), 42⅕s. First amateur, E. Kickham (2¾ Douglas), 42⅘s., speed 52.51 m.p.h.

CLASS VIII.—ONE KILOMETRE STANDING START (Passenger Machines up to 500 c.c.)—1, K. Holden (3½ B.S.A), 50⅘s., speed 44.03 m.p.h. ; 2, *V. E. Horsman (3½ Singer), 51⅘s. ; 3, A. Wray (3½ A.B.C.), 54⅕s. *First amateur.

CLASS IX.—ONE KILOMETRE STANDING START (Passenger Machines up to 750 c.c.)—1, H. Bottoms (6 Bradbury) and K. Holden (B.S.A.), 48⅘s., speed 45.84 m.p.h. ; 3, *J. H. Fox (5 Matchless), 50⅘s. *First amateur.

CLASS XII.—SEALED HANDICAP (for Solo and Passenger Machines and Cycle Cars).—1, N. J. Hall (3½ N.U.T.), 46⅘s. ; 2, R. E. Grice (2¾ Sunbeam) 48⅕s. ; 3, H. Waterworth (3½ Triumph), 52s.

CLASS X.—ONE KILOMETRE STANDING START (Passenger Machines up to 1,000 c.c.)—1, S. B. Briggs (8 Campion), 42⅘s., speed 52.76 m.p.h. ; 2, A. J. Brewin (8 Zenith), 43⅕s. ; 3, E. Longden (8 Dot), 48s.

CLASS XIII.—ONE KILOMETRE STANDING START (Motor Cycles and Passenger Machines).—1, R. F. James (3½ N.S.U.), 44⅘s., speed 50.16 m.p.h. ; 2, W. Jones (2¾ A.J.S.), 45⅕s. ; 3, F. W. Browne (3½ Triumph), 46s.

CLASS XXI.—HALF-MILE FLYING START (Passenger Machines up to 500 c.c.)—1, K. Holden (3½ B.S.A.), 32⅘s., speed 55.21 m.p.h. ; 2, *V. E. Horsman (3½ Singer), 33⅘s. ; 3, A. Wray (3½ A.B.C.), 38⅕s. *First amateur.

CLASS XV.—HALF-MILE FLYING START (Solo Machines up to 350 c.c.)—1, C. Williams (2¾ A.J.S.), 28⅘s., speed 63.38 m.p.h ; 2, W. Stevens (2¾ A.J.S.), 29⅕s. ; 3, H. Newman (2¾ Ivy) and W. Heaton (2¾ A.J.S.), 30⅕s.

CLASS B.—HALF-MILE FLYING START (Solo Machines up to 200 c.c.)—1 H Newey (1.9 Levis), 41⅕s., speed 43.06 m.p.h. ; 2, B. Norris (2 O.K.), 42⅕s. ; 3, G. A. Radley (2 O.K.), 44s.

CLASS XXII.—HALF-MILE FLYING START (Passenger Machines up to 750 c.c.)—1, K. Holden (3½ B.S.A.), 33⅘s., speed 53.89 m.p.h. ; 2, *V. E. Horsman (3½ Singer) and H. Bottoms (6 Bradbury), 33⅕s. *First amateur

One of the sidecar competitors crossing the finishing line. On the left will be seen the large score board, and on the right the grand stand and officials' tents.

CLASS XIV.—HALF-MILE FLYING START (Solo Machines up to 275 c.c.)—1, O. Wade (2½ New Imperial), 38⅕s., speed 46.39 m.p.h. ; 2, G. A. Radley (2 O.K.), 42⅕s. ; 3, A. J. Jenkins (2½ Ivy), 43⅕s.

CLASS XXIII.—HALF-MILE FLYING START (Passenger Machines up to 1,000 c.c.—1, S. B. Briggs (8 Campion), 27⅘s., speed 65.69 m.p.h. ; 2, A. J. Brown (8 Zenith), 27⅕s. ; 3, E. Longden (8 Dot), 32s.

CLASS XVI.—HALF-MILE FLYING START (Solo Machines up to 500 c.c.—1, H. Riddell (3½ Ivy), 25s., speed 72 m.p.h. ; 2, C. R. Collier (3½ Matchless), 25⅕s. ; 3, J. Cocker (3½ Triumph), 25⅘s. First amateur, G. Kendall (3½ Norton), 25⅕s.

CLASS XVII.—HALF-MILE FLYING START (Solo Machines up to 750 c.c.)—1, C. R. Collier (3½ Matchless), 24⅘s., speed 73.77 m.p.h. ; 2, J. Cocker (3½ Triumph), 25⅕s. ; 3, H. Riddell (3½ Ivy), 25⅘s. First amateur, J. H. Fox (5 Matchless), 26s.

CLASS XIX.—HALF-MILE FLYING START (T.T. Machines up to 350 c.c.)—1, E. Kickham (2¾ Douglas), 27⅘s., speed 65.69 m.p.h. ; 2, C. Williams (2¾ A.J.S.), 27⅘s. ; 3, W. Heaton (2¾ A.J.S.), 28⅕s.

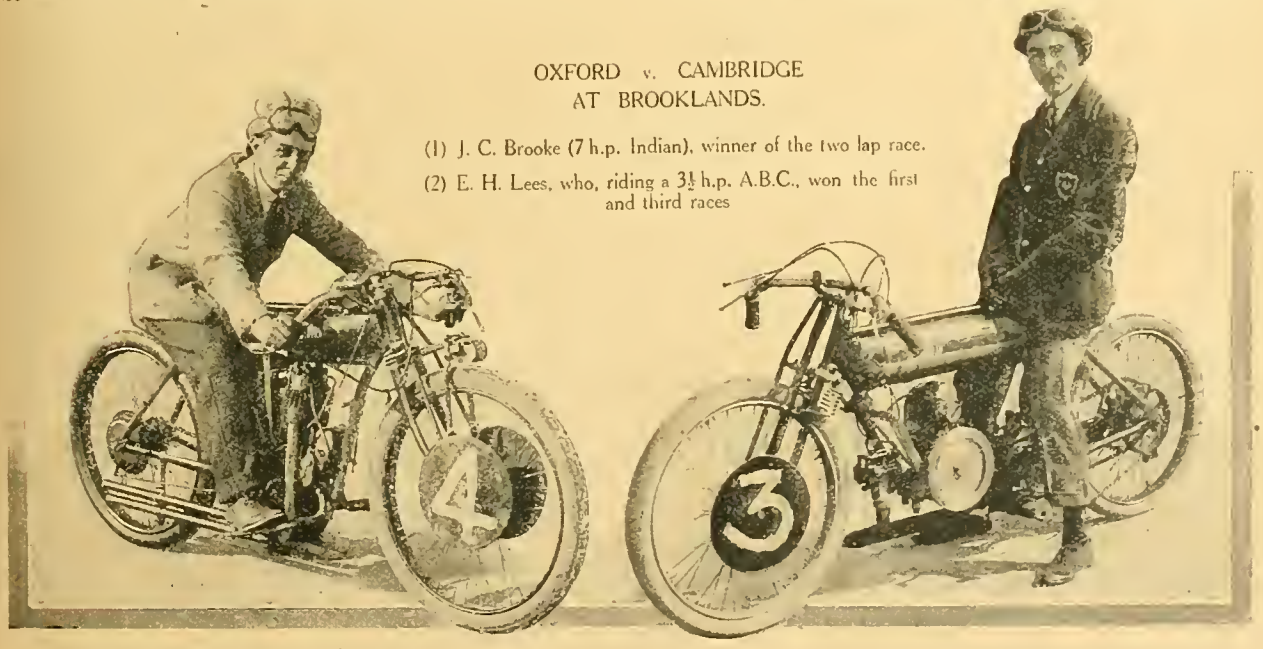
CLASS XVIII.—HALF-MILE FLYING START (Solo Machines up to 1,000 c.c.)—1, C. R. Collier (7 Matchless), 20⅕s., speed *87.38 m.p.h. ; 2, A. J. Brewin (8 Zenith), 21⅘s. ; 3, H. Reed (8 Dot), 21⅕s. First amateur, A. J. Brewin. *Fastest time of the day.

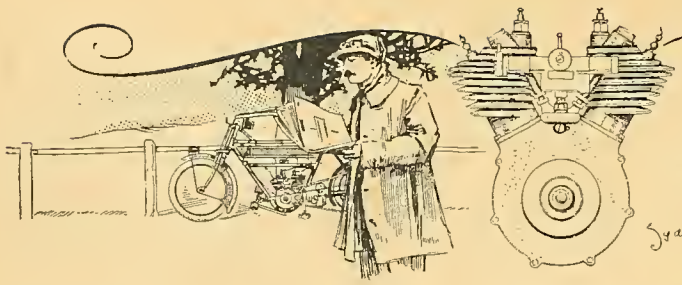
CLASS XX.—HALF-MILE FLYING START (T.T. Machines up to 500 c.c.)—1, C. R. Collier (3½ Matchless), 23⅕s., speed 77.59 m.p.h. ; 2, J. Cocker (3½ Triumph), 25s. ; 3, *G. Kendall (3½ Norton), 25⅕s. *First amateur.

OXFORD v. CAMBRIDGE AT BROOKLANDS.

(1) J. C. Brooke (7 h.p. Indian), winner of the two lap race.

(2) E. H. Lees, who, riding a 3½ h.p. A.B.C., won the first and third races





SEVERE SCOTTISH EVENT.

Glasgow M.C.C. One Day Trial.

THE conditions were all that could be desired on Saturday last when the Glasgow M.C.C. held their annual twelve hours reliability trial. Brilliant sunshine and an entire absence of wind, combined with the fact that the route chosen on this occasion passed through some of the most magnificent scenery in the West of Scotland, made the event one of the most enjoyable of the season. The route, in contrast to many of the twelve hours trials north of the border, was particularly severe, including several notorious Argyllshire hills, as well as the well-known Rest and be Thankful. The latter, it may here be stated, was, if anything, the easiest of the lot, and only the bad hairpin at the top caused any trouble. The following was the itinerary of the day's journey: Glasgow, Bearsden, Balloch, Arrochar, Rest and be Thankful, St. Catherine's, Otter Ferry, Dunoon (lunch stop), Ardentinny, Glen Finart, Whistlefield, St. Catherine's, Hell's Glen, Arrochar, Balloch, to Glasgow. The three observed hills were Rest and be Thankful (including the Little Rest), Glen Finart, and Alt Glinnie Mhoir. To obtain a gold medal competitors had to make a clean ascent of all these hills, and be at checks to time. There were forty-eight starters.

The ascent of Rest and be Thankful.

Very few experienced trouble to Arrochar. A. T. Downie (5-6 Ariel sc.), however, had tyre trouble near Bearsden, and W. Turpin (6 Sunbeam sc.) was forced to detach his sidecar owing to wheel bearing trouble. On "The Rest" A. McCulloch (2¾ A.J.S.) failed, as did T. F. Walkinshaw (3½ N.S.U.), the latter taking the hairpin too fast. W. Carlaw (6 Swift c.c.) had distinctly hard lines, as in changing into low gear the little vehicle slid back a few yards, stopped, and then got away. A. J. Griffiths, on an O.K. Junior, easily the smallest engine in the trial, made a good ascent, appearing to have plenty of power in hand. From the top of the hill to St. Catherine's was easy going, thereafter the road deteriorated, and between Otter Ferry and Dunoon was merely a track, the surface being vile and the road particularly twisty. So bad was this stretch that miniature machines and sidecars were allowed twenty minutes extra over the solo riders.

One or two were late at the lunch control. D. B. Stirling (6 h.p. Clyno sc.) took the wrong turn, and will probably be disqualified. A. F. Downie (5-6 h.p. Ariel sc.) had further tyre trouble, and did not finish. J. L. Smith (2½ h.p. Triumph) also had tyre and plug trouble and was very late.

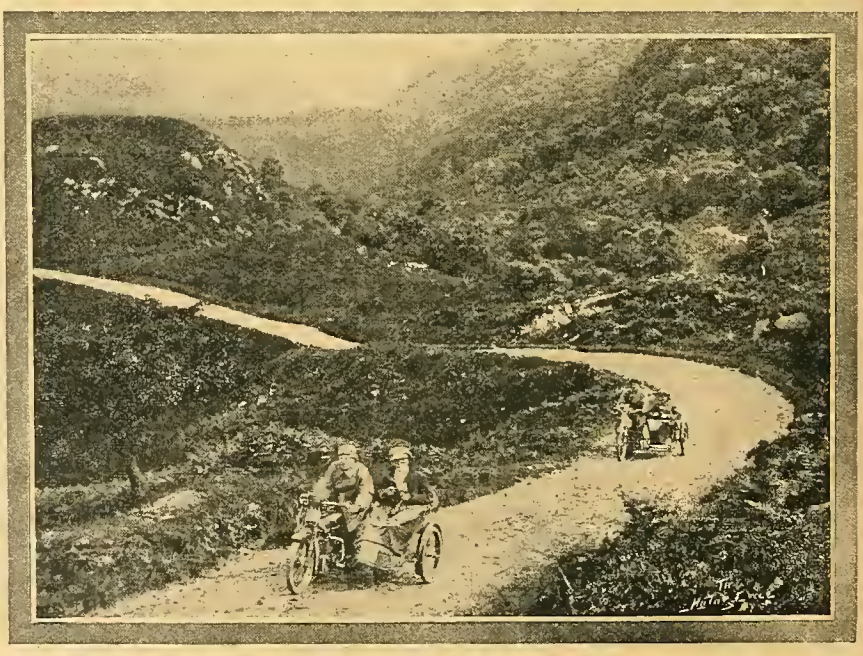
Climbing Glen Finart.

After lunch the very severe ascent through Glen Finart was tackled, and many of the competitors found the last hairpin too much for them. Morris (3½ h.p. Ariel) made quite a good ascent, as did W. Deans (3¼ h.p. Lea Francis). W. Carlaw (Swift c.c.) got round well, while D. Bell (6 h.p. A.J.S. sc.) also had little trouble in making the ascent. One of the best ascents of the day was that of D. S. Alexander (8 h.p. Williamson sc.) He took the corner at speed, and finished the climb very fast. The F.N.'s also made light of the ascent. A. J. C. Lindsay (3½ h.p. Rover sc.) just failed near the summit, as did R. G. McGibbon (3½ h.p. Edmund sc.) and A. J. Griffiths (O.K.) The following were the other failures: J. McMeekin (3½ h.p. Rudge); Murray Lang (3¼ h.p. Lea-Francis), who, however, really stopped when over the summit; Stoddart (3½ h.p. B.S.A. sc.), who was kept back by another sidecar combination; R. Holmes (6 h.p. Clyno sc.); J. L. Smith (2½ h.p. Triumph); J. Bell (6 h.p. A.J.S. sc.), who was baulked, and T. Findlay (3½ h.p. James).

List of the Survivors.

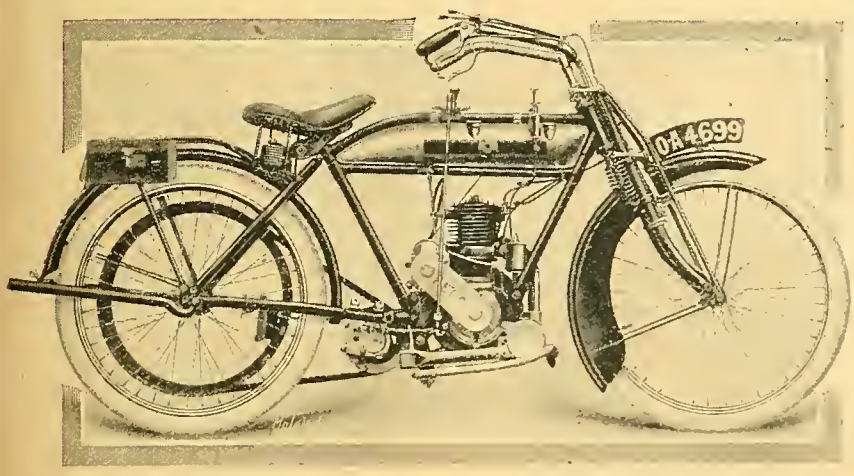
The last hill, Hell's Glen, was responsible for a few more failures, but the majority had little trouble in checking in at Arrochar to time. The following checked in during the evening at Blythswood Square:

W. Carlaw (6 h.p. Swift c.c.), T. S. V. Phillip (6 h.p. A.S. sc.), T. A. McCreadie (2¾ h.p. Sunbeam), A. U. R. Downie (2¾ h.p. A.J.S.), W. Morris (3½ h.p. Ariel), F. M. Lang (3¼ h.p. Lea-Francis), A. J. Griffiths (2 h.p. O.K. Junior), J. McMeekin (3½ h.p. Rudge), A. McCulloch (2¾ h.p. A.J.S.), H. W. Ballardie (5-6 h.p. Hazlewood), W. Bryson (6 h.p. A.J.S. sc.), W. Deans (3¼ h.p. Lea-Francis), D. S. Alexander (8 h.p. Williamson sc.), F. M. Stoddart (4 h.p. B.S.A. sc.), W. J. Gates (7 h.p. F.N.), W. Dickie (7 h.p. F.N.), J. S. Chisholm (3½ h.p. Ariel), A. J. C. Lindsay (3½ h.p. Rover sc.), J. S. Dallas (5-6 h.p. New Hudson sc.), T. Tennent (3½ h.p. Rudge), T. Shoda (3½ h.p. Douglas), H. E. Whittingham (4¼ h.p. James sc.), J. J. Whyte (7 h.p. F.N.), R. W. Reid (6 h.p. Bradbury sc.), F. C. Rayment (4 h.p. Triumph), D. B. Stirling (6 h.p. Clyno sc.), W. Alexander (7-9 h.p. Indian sc.), E. Mazella (3½ h.p. Triumph), R. Black (7 h.p. F.N.), J. Bell (6 h.p. A.J.S. sc.), J. Barclay (3½ h.p. Triumph), R. H. Jones (3½ h.p. Triumph), D. Bell (6 h.p. A.J.S. sc.), R. G. MacGibbon (3½ h.p. Edmund sc.), A. T. Brash (7 h.p. Harley Davidson), and T. Findlay (3½ h.p. James).



W. Bryson (6 h.p. A.J.S. sidecar), followed by another competitor in one of the many glens.

A Trump-Peco Two-stroke.



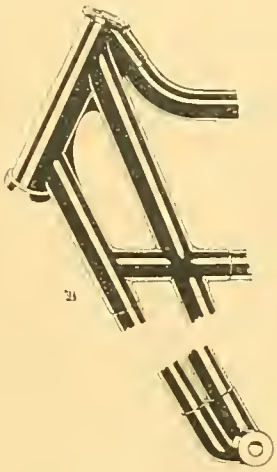
Right hand side of the new two-stroke Trump-Peco

ALMOST every week there are fresh additions to be noted to the two-stroke ranks, and one of the latest is the neat little mount to be marketed by Trump Motors, of Lombard Street, Birmingham. On a recent visit to the works we inspected the preliminary model, which will be altered in detail only, except for the frame construction described later. The 2¾ Peco engine, 75 × 79 mm. bore and stroke, is fitted, and carries a U.H. magneto, and either Amac or Senspray carburetter. The drive is either direct or by chain and belt with a two-speed counter-shaft gear, or through a three-speed hub, the same design of frame being utilised in each case. Lubrication is quite separate from the petrol supply, oil being passed through a Best and Lloyd sight-drip feed direct to the cylinder, whence it feeds the bearings in the usual Peco manner. The tank is a neat oval in section, and has a large capacity. Druid forks are fitted, and the front mudguard has full valances.

Unusual Frame Design.

The frame construction to be employed is unusual, and the patentees, Mr. W. A. Forster, of Trump Motors, and Mr. C. Pearson, of Peco Motors, claim that it is unbreakable. As was pointed out to us, the most common point of fracture is just below the head lug, and a reference to the appended sketch will show that the down tube is duplicated in the case new frame. This divides the strains both from the engine explosions and from the pivoting action of the forks, while in the latter case it is considerably assisted by the curve in the top tube, which is designed with that object. This head construction is most interesting and forms a novel and practical feature.

Originality in design is always interesting, especially when there is sound reason for the departures from standard, and we were much impressed by the new Trump-Peco frame.



Head lug and front down tubes on the two-stroke Trump-Peco

As showing the great interest taken in motor cycle events in South Africa, the above photograph was taken at the finish of the Johannesburg-Durban race, and shows the winner, B. Adams, on a 3½ h.p. Rudge (in white circle), finishing at Durban. Second place was taken by H. J. Thompson, who also rode a Rudge Multi

"THE MOTOR CYCLE" LIST OF WEEK-END CLUB EVENTS.

July 10th.—Ripon and District M.C.C. Reliability run for President's Cup.
„ 11th.—Middlesex M.C.C. Run to Digswell, 3.15 p.m.
„ 11th.—Tottenham and District M.C.C. Run to Harpenden.
„ 11th.—Cardiff and District M.C.C. Hill-climb.
„ 11th.—Middlesbrough and District M.C.C. Run to Rievaulx Abbey.
„ 11th.—Midland Light Car Club. Open rally at top of Fish Hill, Broadway.
„ 11th.—N.W. London M.C.C. Run to Walton-on-Thames Regatta.
July 13th.—Plymouth and District M.C.C. Evening run to Two Bridges, 7.30
„ 15th.—Surrey M.C.C. Speed trials.
„ 15th.—Folkestone and District M.C.C. Run to Canterbury.
„ 15th.—Castleford M.C. Reliability trial.
„ 18th.—Meet at Brooklands for M.C.C. races.
„ 18th.—Perth and District M.C.C. Team competition for the Waverley Cup, open to all Scottish motor cycle clubs.

Liverpool A.C.C.

In the reliability trial held on the 27th ult., G. B. Court (Douglas), L. Mogridge (Rudge), and J. Green (New Hudson) tied for the first prize, and no decision has yet been arrived at.

Harrogate and District M.C.C.

The annual two days reliability trial for some reason or another attracted only a moderate number of members for the trip, which went up into Lakeland, and included a run round Windermere, Rydal Water, Grasmere, Thirlmere, Derwentwater, and Ullswater. The chief hills were Red Bank, Dunmail Raise, Kirkstone Pass, and a bad and stony ascent from Nateby to Mnker, all of which were included in non-stop sections. Red Bank caused W. Hill (3¾ Scott sc.) and F. Wray (4 James sc.) to fail, and later on Wray retired. Near Sedbergh E. R. Davies (2¾ A.J.S.) tried conclusions with a car and came off second best, and at this point W. Hill, who was passing at the time, like the good sportsman he is, gave up his chances and took Davies home in his sidecar, and, despite its extra load, the Scott did splendidly. W. Fawcett (3½ P. and M.), after suffering from numerous punctures, tried to make up time on a flat tyre, with the result that he had a fall and retired. J. Charles (2¾ Douglas) had chain trouble, and G. Hill, on a similar machine, had a lot of tyre trouble.

Only the following finished with clean sheets, having climbed all hills, completed the non-stop sections, and clocked in to time at all checks: H. E. Ellis (2¾ A.J.S.); C. H. Charles (3½ Singer); C. Falkingbridge (3½ Rudge Multi); and G. H. Threlfall (3¾ Scott).

Folkestone and District M.C.C.

A hill-climb was held at Waterworks Hill on the 1st inst. Results:

Event 1.—For most weight propelled up the hill on least petrol consumption: 1, A. J. McLachlan (6 Royal Enfield), 965; 2, A. S. Burvill (6 Royal Enfield), 830; 3, A. E. Franks (6 Royal Enfield), 711.

Event 2.—For machines showing the greatest difference between fastest and slowest times up the hill: 1, R. Nichols (7 Indian), slow 241s., fast 45s.; 2, A. E. Franks (6 Royal Enfield), slow 207s., fast 52s.; 3, B. R. Billings (3½ P. and M.), slow 215s., fast 73.2s.

Newport Pagnell and North Bucks M.C.C., and Wellingborough, Rushden and District M.C.C.

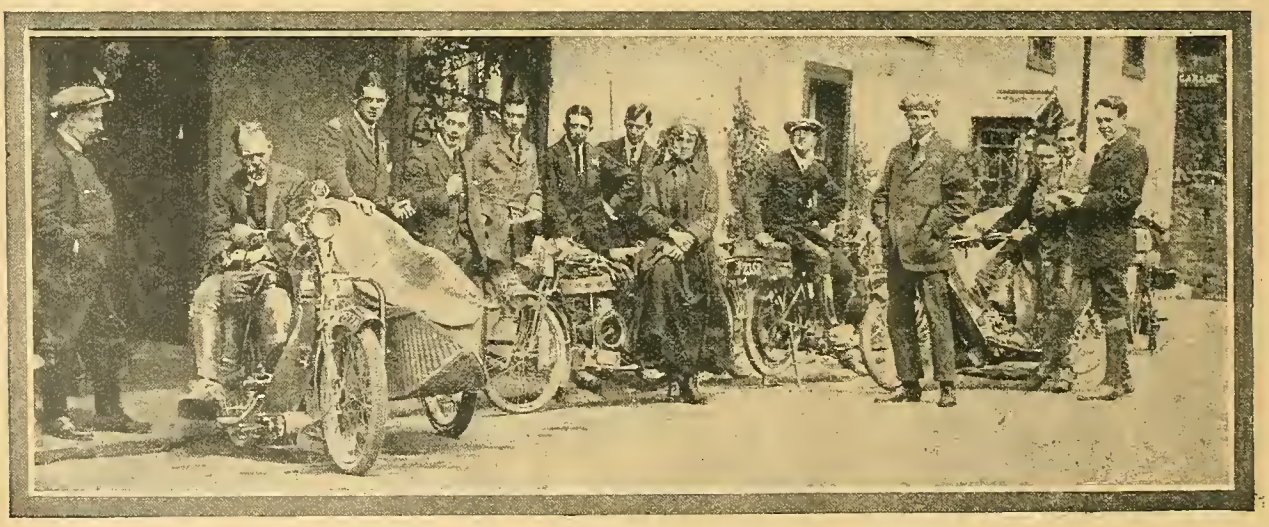
An inter-club trial was run off on the 27th ult. over a course of about 100 miles. Results:

Wellingborough.—A. J. Watts (3½ Triumph) and W. A. Perkins (3½ Triumph), 96 marks; F. Briggs (6 Rex and sc.), 93; H. Sanders (3½ Triumph), 91; H. Bennett (3½ Humber), 89; C. M. Newton (2¾ Douglas), 88; A. Shortland (3½ L.M.C.), 86; J. Walker (3½ Triumph), 85; E. G. Palmer (2¾ Douglas), 73.

Newport.—C. Webster (6 Bradbury and sc.), 95; G. F. Trimmer (6 Enfield and sc.), 86; J. V. Shaw (3½ Ariel), 85; C. M. Wilford (6 Enfield), 85; T. Bowden (3½ Triumph), 85.

Coventry and Warwickshire M.C.

The Coventry and Warwickshire M.C. will, on the 25th inst., hold an open trial for cycle cars and a closed event for light cars up to 1,500 c.c. There will be three classes: Class I., for vehicles with engines up to 750 c.c.; Class II., ditto from 750 to 1,000 c.c.; Class III., ditto from 1,000 to 1,100 c.c. The start will take place at 8 a.m. on the road between Gibbet Hill and Stoneleigh, and the course will be approximately 150 miles. Entries to Mr. H. Whiteman, Hertford Street, Coventry, close on the 18th inst.



HARROGATE AND DISTRICT M.C.C. TWO DAY RELIABILITY TRIAL.

A group of competitors at Pooley Bridge, at the north end of Ullswater, the lunch control on the second day's run.

Club News.

The Cyclecar Club.

A club hill-climb will be held at South Harting on July 18th, a feature of which will be a special class for lady drivers.

Tyldesley and District M.C.C.

The annual one day reliability trial was held recently, when about thirty members took part. There were two non-stop sections and one secret check. Results: 1, Mr. Clare (3½ Triumph sc.); 2, Mr. Cowburn (4 Triumph); 3, Mr. Greenhalgh (4¼ B.S.A.).

Cape Peninsula M.C.C.

An open rally for motor cyclists took place on June 6th, the venue chosen being some twenty miles away from Cape-town amongst most picturesque surroundings. From near and far solo and sidecar riders turned up, and soon a hundred outfits were lined up in the grounds of the Royal Hotel. A public vote decided to which owner of the smartest outfit the special prize would be awarded. This ultimately went to W. J. Houghton, who was riding his two-year-old Triumph, which was in the most perfect condition imaginable. The big crowd of motor cyclists were entertained to tea by the C.P.M.C.C.

Herefordshire M.C.C.

The members of the Herefordshire Club held a picnic at Speech House in the Forest of Dean, where they were met by the Cheltenham, Gloucester, and Abergavenny Clubs on June 28th. The captain, Mr. W. A. Smith, gave some surprise prizes, which were won by the following: Mr. Southgate (6 h.p. Rex sc.) for being No. 13 to get there, as that number is generally considered unlucky; Mr. W. B. Gibb, of Gloucester, was given the prize for having the most attractive, clean, and comfortable passenger machine (a Douglas cycle car); Mr. Brain, riding a Sunbeam, was awarded for same as above, but solo. About 3.30 the party dispersed in various directions for tea, some going to Ross, others to Symond's Yat, and most of the Herefordshire men (twenty-two in number) went on to Chepstow.

Showing how the four-cylinder Henderson attracts attention, even on its native soil. It is seen outside one of the principal hotels in Detroit, U.S.A.

OXFORD v. CAMBRIDGE AT BROOKLANDS.

Start of the three lap race for solo machines.

On the starting line in the sidecar and cycle car two-lap race.

The first time the Oxford and Cambridge Clubs attempted this year to run their race meeting at Brooklands, which was in the springtime, it rained so heavily that the affair had to be postponed. On Tuesday, June 30th, however, when the fixture was held, the weather was glorious. Unfortunately, owing to poor advertising, very few people knew of the meeting, and so the attendance was small. Results:

Two Lap (about 5½ Miles) Handicap (for Motor Cycles not exceeding 500 c.c.)—1, E. H. Lees (A.B.C.), 16s.; 2, T. C. McKenna (Norton), scratch; 3, L. Bostoo (N.U.T.), 68s. Time 5m. 57⅘s. Speed 64.71 m.p.h.

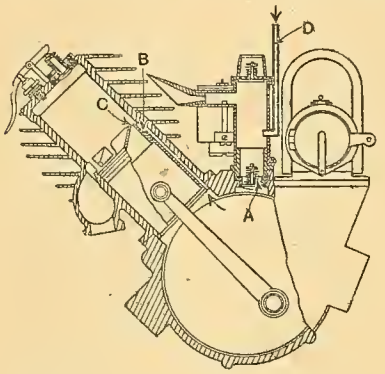
A Two-stroke Engine.

This engine is of the two-port crank case compression type, drawing gas into the crank chamber through an inlet valve B arranged just beneath the carburetter. The invention in this particular case consists in making the end B of the transfer passage at right angles to the length of the cylinder and

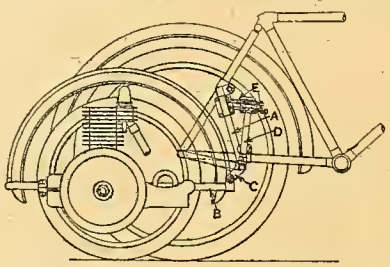


providing the piston with a lip C of particular shape, so that directly the transfer port at B is uncovered the gas is delivered to the top of the cylinder. As the piston approaches its outer limit of travel the gas is delivered more and more across the cylinder. Oil is admitted by the pipe D.—D. Ruva, No. 11,588, 1913.

PATENTS by Eric W. Walford

An Auto-wheel Attachment.

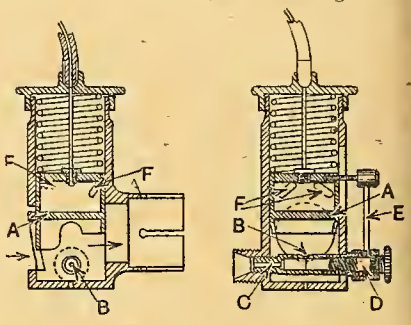
This particular arrangement is provided to insulate the cycle from the impulses of the engine. To the cycle is attached a triangular frame A, and the horizontal frame B of the auto-wheel attachment, instead of being secured directly to the frame A, is pivoted to a link C, to which is attached an arm D lying between opposed springs E



attached to the frame. Thus the thrust of the engine is transmitted to the machine through the springs E.—R. O. Clark, No. 5,324, 1913.

A Simple Carburetter.

This carburetter is of the kind in which movement of the throttle alters the jet opening. It will be noticed that the carburetter is very small, comprising merely a vertical sliding valve A actuated by a Bowden wire, and arranged to control the passage of air through the carburetter in the direction of the arrows. At B is a fuel outlet receiving fuel



through a needle valve C. The stem D of this valve is connected by a crank and a link E to the throttle, so that as the throttle is raised the needle valve is unscrewed, and more petrol is allowed to pass to the jet. The connection between the needle valve and the throttle is adjustable. At F are holes in the throttle valve, which, when the throttle is completely closed, allow pure air to pass to the engine.—D. McGregor, No. 5,496, 1913.

Sidecars for Rough Countries.

A notable feature of the Scottish Six Days Trials was the number of breakages of sidecar chassis. It is interesting to note, in view of this, that every Montgomery sidecar engaged in these trials emerged in excellent condition.

A Good Record.

In the recently concluded Scottish Trials, the six P. and M.'s entered were awarded five gold medals and one silver medal, the silver medal going to the only lady rider who completed the trial. The new P. and M. chain cases proved most successful in every way.

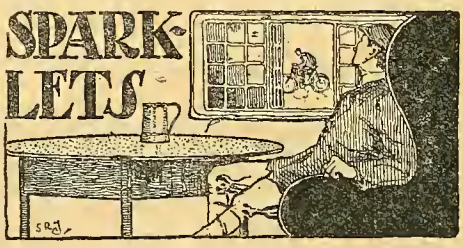
For Tourists in Scotland.

Messrs. Gall and Inglis have recently published a new and excellent series of road maps know as the Gradient Road Maps. The section sent to us is that of Inverness, Speyside, and the Caledonian Canal. The quality of the roads is shown by means of colours, and the hills are indicated by triangles of varying thickness denoting their steepness. The superior roads are marked in bright yellow, the good roads in dark yellow, the inferior roads in pink, and the rough roads in blue. If a road is not coloured at all it is a sure indication of its badness.

TWO STROKES AND LIGHTWEIGHT MACHINES

will form the main topic in a special issue of *THE MOTOR CYCLE* to be published on THURSDAY, JULY 23rd.

SPARKLETS



A Powerful Lightweight Engine.

In the recent trial for the Calthorpe Cup the O.K. Junior machines performed remarkably consistently, and their speeds up Edge Hill were wonderful for so small an engine. This engine is specially constructed for Messrs. Humphries and Dawes, and is known as the O.K. engine.

A Severe Gear Test.

On another page of this issue Mr. G. D. Abrahams gives a graphic description of the conquest of Sty Head Pass by Mr. W. B. Little on his Premier. It is interesting to note that the indispensable change speed gear on this journey was an Armstrong hub, which went through the tremendous test without any trouble or attention.

Royal Ruby Extensions.

The growth of the Royal Ruby business has necessitated the acquirement of greatly extended premises, and the works of the company at Canal Street, Ancoats, Manchester, are now being more than doubled in size. It is hoped with these extensions to cope with the very rapidly growing demand for Royal Ruby motor cycles.

Hutchinsons in Scotland.

In the recent Scottish Six Days trials Hutchinson tyres scored many successes. Of the eight competitors who started on these tyres seven finished and secured gold medals, the other competitor having the misfortune to fall over the cliffs at Applecross and thus place himself *hors de combat.*

A London-Edinburgh Echo.

We are informed by the Competition Secretary of the M.C.C. London-Edinburgh Run that a gold medal for the single journey has been award to T. Silver (4 Quadrant sc.). Silver was originally disqualified for being fifteen minutes ahead of time, but this was found to be an error on the part of a checker.

Belts and Speed Trials.

The Lycett "Reliable" belt was in great demand at the Birmingham M.C.C. speed trials on June 27th. C. R. Collier used this belt on his new 7 h.p. Matchless racer, which made fastest time of the day, and several other winners pinned their faith in the Lycett belt for transmission purposes.

The Hutchinson trophy awarded to the B.S.A. team for regularity of running in the Circuit de l'Eure.

he world fit
SCH'

A LETTER FROM

The Triumph Cycle Co., Ltd., one of the oldest and most successful manufacturers in the world.

Dear Sirs, *June 29th*, 1914.

You will no doubt be interested to hear that we have obtained the utmost satisfaction from the Bosch Magneto. We believe that we were one of the first — if not the first — Manufacturers to adopt magneto ignition on Motor Cycles as standard. This was as far back as 1905, and the many thousands that we have fitted since that year have given splendid service.

As you are aware, we have a very high conception as to what the quality and workmanship of a Motor Cycle should be, and we have no hesitation in saying that the standard you have set, and consistently worked to, in the manufacture of your Magnetos, deserves the highest praise.

We are convinced that the revival of motor cycling was to a very large extent due to the magneto, and in particular to the Bosch Company, who were the first to supply in necessary quantities, and at the same time a really reliable article.

Yours faithfully,
TRIUMPH CYCLE CO., LIMITED.
M. J. SCHULTE
(*Managing Director*).

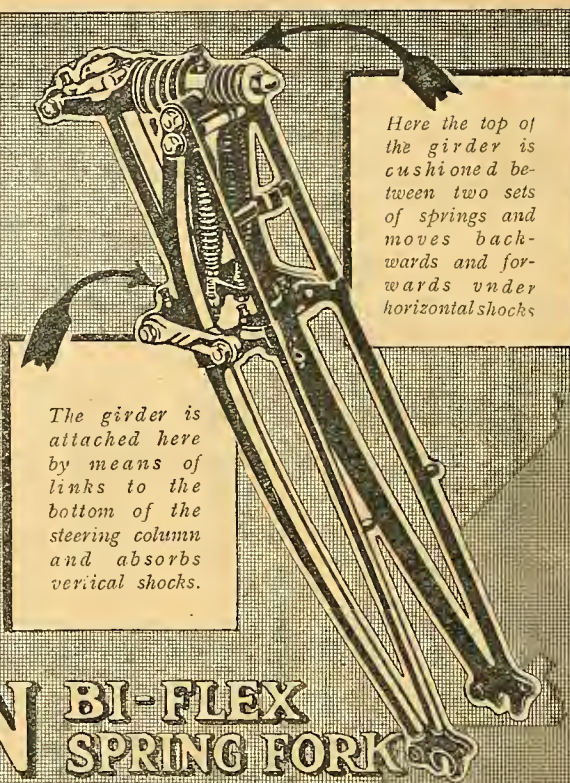
The Brampton way of absorbing shock

is the simple, the thorough, and the most effective way. Look at the illustration and notes and you will observe that *both* vertical and horizontal shocks are absorbed by the Brampton Bi-flex spring fork. Other makes take up only one direction shock — the other is transmitted through the frame to the rider with uncomfortable and sometimes disastrous results.

Bearing surfaces are large and provision is made for taking up wear in links.

Why not write to-day for our fully descriptive pamphlet? Post free.

BRAMPTON BROS., LTD.,
OLIVER STREET WORKS BIRMINGHAM

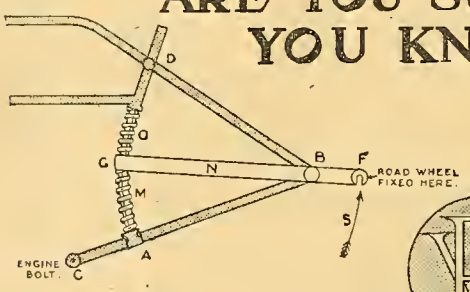


Here the top of the girder is cushioned between two sets of springs and moves backwards and forwards under horizontal shocks

The girder is attached here by means of links to the bottom of the steering column and absorbs vertical shocks.

BRAMPTON BI-FLEX SPRING FORK

ARE YOU SURE YOU KNOW



IT'S SO SIMPLE.

the working of the **P.V. SPRING FRAME?**

If not, read this.

It does not hinge at **A**, this point being absolutely rigid, as are the points **C** to **A**, **A** to **B**, **D** to **B**, and **D** to **A**—in fact, the whole of the shaded part is in one piece. **B** is the point where the road wheel is fitted on rigid machines. This shows that the P.V. has all the advantages of the rigid type frame as regards stability.

At the point **B** the only working bearing is situated. On this bearing point oscillates the springing arm **N**, which extends from **F** to **G**, at which point it encircles the radius tube of frame, back again to **F** on the opposite side. A shock spring **M** and a recoil spring **O** also encircle this tube as shown.

It can now be clearly seen that all shock (road unevenness) as directed at ⇨ **S** is absorbed by spring **M**, counteracted by **O**, and damped at **G**.

This explains the principle of the P.V. Spring Frame, which four years' road test and its constant successes in Trials proves far ahead of all others.

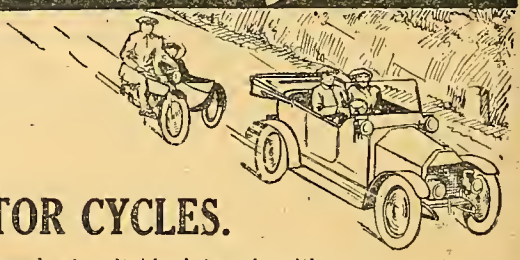
Metal Plate Tyres



THE NEW NON-SKID FOR LIGHT CARS & MOTOR CYCLES.

The tread of the M.P. tyre is recessed at suitable intervals with steel plates which afford a perfect grip on wet and greasy roads, while the rubber portion of the tread prevents skidding on dry wood or asphalt.

The depth of the plates secures more than double the life of the ordinary steel-studded non-skid.

Motor cyclists will especially appreciate the additional protection afforded by the M.P. tyre against skidding and punctures.

One of the many testimonials from riders of Juno Motor Cycles
88, Greaves Street, Little Horton, Bradford
May 30th, 1911.
Dear Sirs—I have now run my "Juno" Two-stroke for 1,000 miles, and it has proved itself so reliable that no adjustments have been made. The way it takes hills is marvellous, it is the best value for money I have come across.—W. S. Capstick.

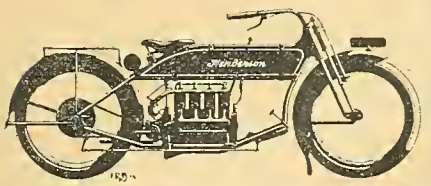
:: IN THE :: SCOTTISH SIX DAYS TRIAL

The Henderson



ECLIPSED ALL OTHERS

THE MOTOR CYCLE

REFERRING TO ITS PERFORMANCE ON VARIOUS HILLS, SAID:—

. . . . The four-cylinder Henderson made a LOVELY CLIMB, purring silently, and steering to a hair with absolute steadiness. . . . . The Henderson again did the prettiest climb of the ENTIRE ENTRY. . . . . Robertson Brown has had cruel luck with his Henderson. He lost his way on Monday, and, misunderstanding the rules, mistimed his riding schedule, and forfeited a few marks, to which, under the curious E.D.M.C.C. rules, a "first time" penalty of fifty extra marks is added. Since then he has been going great guns, and has ECLIPSED THE ENTIRE ENTRY on more than one hill. To-day he roared up Glendoe only to sustain a dry skid at a loose corner a few miles on, and crashing into a deep ditch, broke the frame.

OUR ONLY EXCUSE FOR THIS ABRUPT FINISH IS THAT AFTER FIVE DAYS OF BUCK JUMPING AND PRECIPICE CLIMBING ONE IS APT TO TREAT WITH INDIFFERENCE SUCH DETAILS AS CULVERTS, LOOSE STONES, HAIRPIN CORNERS, ETC., ETC.

WE LOST A MEDAL BUT GAINED A REPUTATION THAT CANNOT BE ASSAILED.

Last Week's 'Colonial" Trial.

THE A.C.U. Six Days Trials last week developed into a Colonial trial pure and simple, and now we see little excuse for the A.C.U. to organise a Colonial or Overseas test in the autumn, as we recommended them to do some months ago, for the road surfaces over which the trial was held positively equalled any surfaces motor cyclists encounter in the Colonial and Overseas dominions. This must be the case, as motor cycling under the conditions which obtained last week was no pleasure at all; indeed, it became an anxious strain for all the competitors.

The surfaces were indescribably rough, the hills steep, long, and frequent, and the pot-holes and gulleys so deep and freakish that riding became positively a danger. As our readers well know, we have always encouraged the severest tests for motor cycles, sidecars, and cycle cars, as this is agreed to be the quickest and surest method of improving the breed, but having covered practically the whole of the course on a motor bicycle, we do think that the A.C.U. overstepped the mark in this instance.

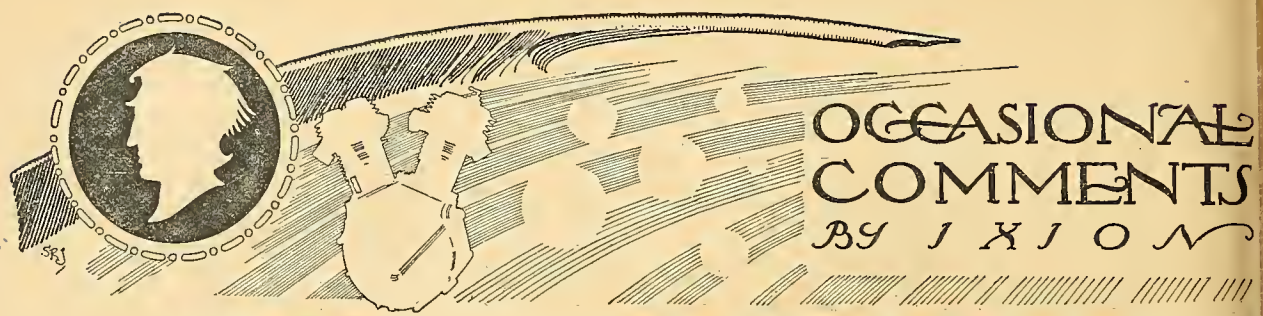
There was not so much to grumble at in the course generally as in the high average speed set. Twenty m.p.h. is a good touring average at any time on a long day's run, but when one considers that there were dozens of hairpins and precipitous hills smothered in loose stones, which competitors could do no more than crawl down or up, time had to be made up somewhere, and consequently speeding, which was both risky to competitors and other road users, became the order. This we consider the worst feature of the whole trial, and quite a number of retirements were due to hitting gulleys and deep holes unawares at speeds in excess of the legal limit.

Now, as we have previously pointed out, everything that can be urged against such a severe course and difficult conditions being arranged helps to bring out in bold relief the performances of those who were successful in satisfying all the conditions throughout the week. It says much for the modern motor cycle, sidecar, and cycle car that so many were able to comply with the rules in every particular. We do, however, sympathise with those who by an unfortunate piece of luck cannoned a huge stone on one or other of the test hills and were brought down, and thus deprived of marks. In this connection the hindermost competitors unquestionably had the most difficult task, as after the first forty had passed the loose roads were usually badly cut up by the driving wheels of the passenger machines.

Lessons from the Results.

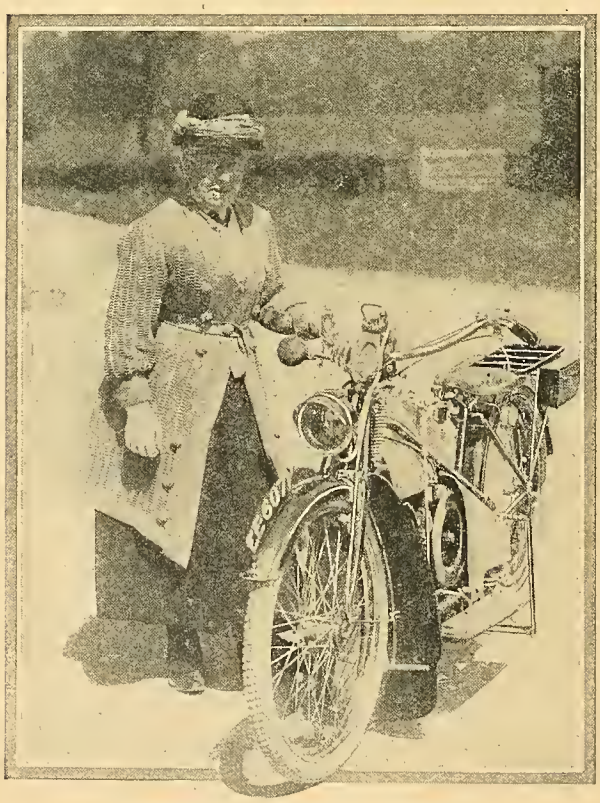
THE A.C.U. certainly have the support of the results of the trial to back up their policy of arranging freak courses, for it will be seen that over fifty gain gold medals. It has often been pointed out that the maximum award in a trial in which but few such awards are gained is far more valuable to a maker than an award which is so common that practically every competitor is placed on the same footing at the finish. Again, referring to the results, we observe that in every instance without exception the special awards have been gained on three-speed mounts, which significant fact will not escape the observant. It is more than a coincidence that three-speeders should have scored so decisively, as the special tests included this year, such as acceleration, speed, and ease of restarting on a gradient, were all in favour of a multiplicity of speeds. The more gears incorporated naturally the wider is the range of ratios, the top being higher and the bottom gear lower.

The passenger machines in the trial, both sidecars and cycle cars, were hard put to it to conform to the conditions and speed, and it must be confessed that they performed very creditably indeed in view of the nature of the course. Another year we hope to see them finish the trial in larger numbers, and, above all, in better condition.



More Waste Labour!

Speedometers are rather a sore subject with me, ever since a certain howler. However, trusting that readers' memories are short, I will timidly return to the dangerous topic. I have just spent a hot, angry, and grimy hour and a half grovelling on the garage floor, fitting a speedometer to one of my 1914 machines. I took out the front wheel pretty easily; the sole defect of design encountered in that job was the fact that the brake nuts were obviously planned to be removed with a miniature tube spanner, and such a tube spanner was not contained in the kit, nor did one of the required size figure in the very large collection of such tools that graces my walls. As a consequence I got the nuts off with an open-ended spanner, and scratched the fork enamel in the process. Then I screwed the large gear wheel on to the spokes. Having no lathe, I could not spin it for truth; I took its radius with a pair of dividers, and got it as true as I could. Back went the wheel, and next I faced the far more formidable job of fitting the gear box. Theoretically, of course, these brackets are specially made for each brand of machine, and go on like an old glove. Actually, I began by filing out the arm which fits over the wheel spindle: ten minutes with a rat tail got it in place. Then I screwed the nut home, and found the small gear wheel was too close up to the spindle to mesh with its big sister. I managed to loosen the many small, tight and inaccessible nuts which hold the various odds and ends of the gear box bracket together, and finally demonstrated that the bracket, as delivered, prevented the gears from meshing under any circumstances. Off came the whole affair, and the party removed to the vice, where the long-enduring rat tail was requisitioned to reamer out all the holes on the bracket. Just as dusk came on we got the gear box *in situ*, and apparently the wheels were well and truly meshed. Some idiot spun the front wheel of the bicycle, and an irregular grinding noise proved that something was still out of truth. We tossed up whether we should work longer by acetylene, or go in and prime ourselves with liquor to write to the makers of the speedometer. The fall of the coin was in favour of liquor and curses, and the rest of the sad story may be continued in my next. The firm who sold me that machine are making at least a hundred machines a week. I don't say they ought to fit speedometers as part of the *modèle de luxe* equipment, though there's a lot to be said for the Hendee policy. But they might make a jig, fit a flange or other type of gear wheel carrier to the off-side of their front hubs, and let a speedometer concern have a duplicate jig whereby to make their gear box brackets. Who'll be the first?



NEVER TOO LATE TO MEND!

One of the latest recruits to motor cycling is Miss E. Morris, of Lincolnshire, who, though sixty years of age, soon mastered a 2½ h.p. Douglas.

A Curious Incident.

When one of our representatives strikes trouble with his machine while engaged in reporting a trial, he is welcomed back to the office by a storm of chaff. One of our staff contrived to seize up his engine during the Scottish week, and submitted to the inevitable "roasting" on his return with rather an ill grace.

When I got the facts out of him later, it struck me he had been the victim of rather a curious mishap. He was engaging in his first real "blind" of the week, and after five or six miles pretty well "all out," his engine began to smell rather warm. He did the right thing in overlubricating pretty furiously until he saw a trail of blue smoke behind him, and as the engine got no cooler, he maintained the over-lubrication until a plug sooted, and he stopped to clean it. Whilst cleaning the plug, he noticed an oil leak under the engine, and found that the crank case drain plug was missing. Mystery No. 1. Why did the engine

Occasional Comments.—

smoke when there was practically no oil in the crank case? His oil pipe opens on to the near side flywheel at about 10.30 o'clock; apparently some oil was carried round on to the outside edge of the flywheels, and flung into the cylinders; but, as subsequent events showed, whatever oil was not carried round on the flywheel fell on the road almost at once. He progressed, still leaving blue smoke astern, for twenty-five miles to his hotel. Next morning he disliked the sound of his engine, and continued to over-lubricate, dismounting occasionally to clean a sparking plug. He was pretty sure that a big end bearing had got badly scraped during the leakage period, and hoped to keep it going over the final day by pumping in plenty of oil; but after another fifteen miles the big end seized, and the engine stopped quietly on a hill. Mystery No. 2. Why did not the over-lubrication during forty miles of running with a rich blue exhaust cause sufficient oil to enter the big end to prevent further trouble? Oil was entering the bearing during the whole of the forty miles, or the engine must have seized miles sooner than it actually did; yet the oil was powerless to prevent the "scrape" from developing into a "seize." Bearings are often so far damaged in dismounting an engine that it is sometimes difficult to say precisely what has happened; but from his story I should opine that the friction in the scraped brass was so great that a short distance of *continuous* running, say ten miles, was bound to lead to a seizure. Had he been content to cover the last day's run in seven-mile instalments, with frequent stoppages for cooling, he might have got his engine through to the finish, but to run ten miles in one piece was fatal.

The incident shows that an instantaneous dismount is the only safe plan when an engine gets unduly hot, for a weary pressman may be pardoned for taking risks at the end of a hard day. I have never sustained a parallel mishap myself. I remember two occasions on which I actually seized up big ends, and in each case I used paraffin flushings and plenteous lubrication to such good purpose that I covered 300 miles in one case and nearly 500 in the other without a repetition of the trouble.

Delivery Tune Again.

This time the wail refers to an engine equipped with an automatic lubrication system based on crank case suction. The engine was a twin-cylinder, and a defect in the crank case resulted in the oil supply being grossly uneven, one cylinder being starved, while the other sooted its plugs. The overlooking of the defect by the testers was simply unpardonable; it must have revealed itself at a glance to a practised eye, and the novice who received the machine traced the symptom (though not the cause) on his first ride, which shows how superficial the factory tests had been. The makers doubtless imagined they were being tolerably generous in offering to set matters right gratis if the machine were brought to their works, and further promised to get the job done in the day if the machine arrived by 9 a.m. The machine was returned to the waiting customer at 11 p.m., the time and parts not being charged for. He waited for daybreak, and after riding a few miles found that various bulky components began to drop off. When the two silencers were housed in his pockets, and the machine rendered slumber impossible for all residents near the road along which he was travelling, he began a thorough investigation. He discovered that the engine was supported by but one sound bolt; the fitters had replaced the old bolts in the new crank case, which was drilled for bolts of larger diameter, and the bolts had either dropped out or sheared or shed their nuts. On reaching home the indignant owner addressed a six page letter to the managing director.

I don't know whether readers are growing tired of my "delivery tune revelations," but I deem it my duty to keep pegging away at the point until certain recalcitrant concerns set their testing shops in order. The whole sport and industry will suffer so long as one or two badly managed factories persist in treating their clients with such appalling callousness.

A SEARCH FOR OVERSEAS TRACKS IN THE ISLE OF MAN.

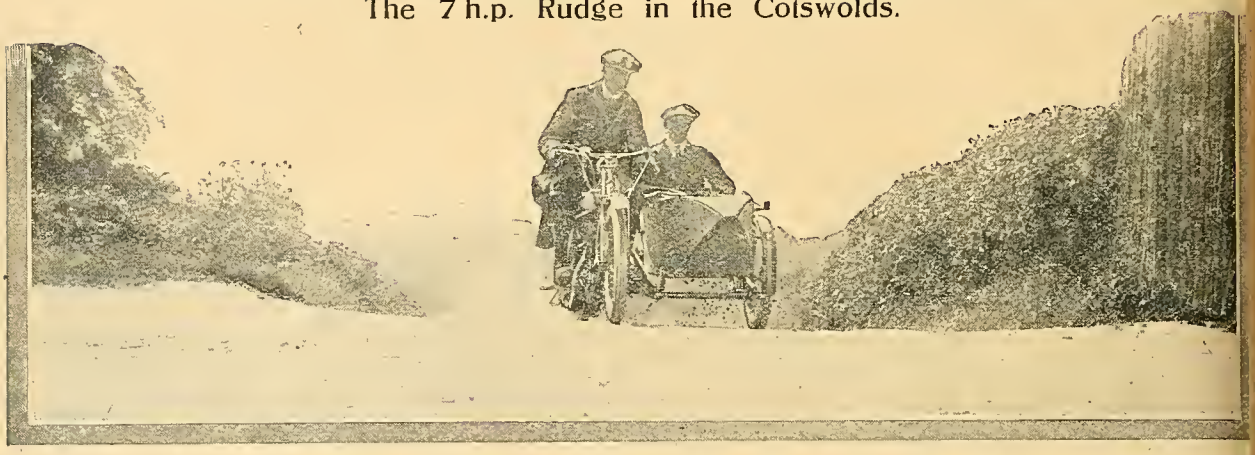
ROAD TESTS OF NEW MODELS.

The 7 h.p. Rudge in the Cotswolds.



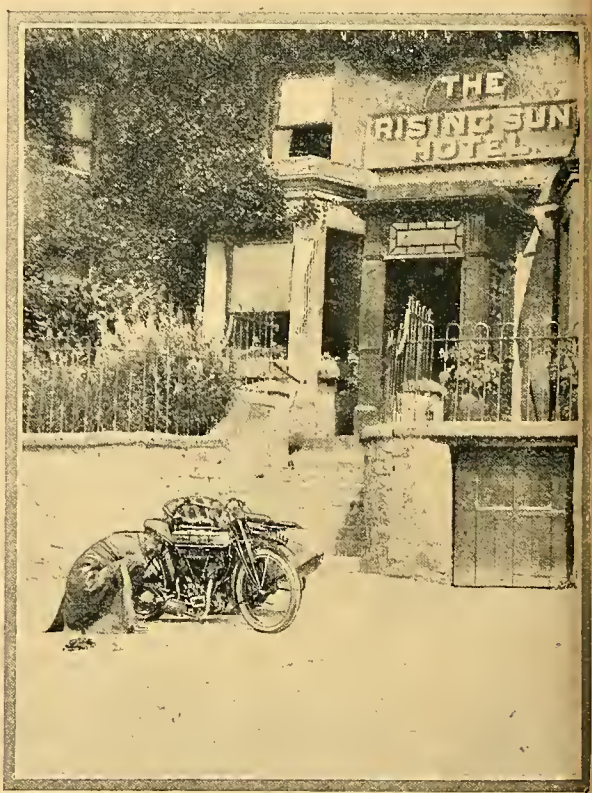
Coming over the brow of Gambles Lane, known to motor cyclists as "Rising Sun."

FOLLOWING on our inspection of the new twin Rudge, we had the pleasure of a day's trial in the Cotswolds. It was our intention thoroughly to "try out" the big twin on the severe hills in which the neighbourhood abounds, for, from the excellent reports we had heard, we judged the standard Edge Hill course too easy. In spite of the fact that the experimental machine had not a kick starter, there was no difficulty in effecting a push start, for the engine fired at once, and the weight of the sidecar outfit was easily overcome, even on a gradient, with the passenger's assistance. While on the subject of weight, it is interesting to remember that the Rudge twin sidecar outfit weighs but a few pounds more than the single, as the two types are identical except for the engine.

Leaving the Rudge works, we made for Warwick, *viâ* Stoneleigh Hill, the gradient of which was just sufficient to show us that the engine would pull well on a high gear. On the long straight stretches of road after passing through Stratford-on-Avon the 3¾ to 1 top gear came in useful, and the machine spun along at a good pace with the engine turning over comfortably. The speed indicator showed that the maximum pace was well up to the average of sidecar machines, while, owing to the multi-gear, by means of which just the right ratio can be employed, and the fine cool running of the engine, a high average can be put up with comfort.

Saintbury Climbed Easily.

On reaching Saintbury we turned to the left and up the long twisty hill. This was our first real chance of opening up, and it was at once evident that there was plenty of power to spare, and we toured up the hill at a good speed with the throttle half shut and the gear lever several notches from the lowest position. Just after the bad part of the hill had been surmounted a flock of sheep was encountered, which necessitated a long stop, but on restarting the engine picked up on the gradient in great style. Willersey was in fine order, and we decided to include this climb on the return journey, and in the meantime we pushed on to Winchcombe and Sudeley Hill. The gradient held no terrors for the big Rudge, but the deep ruts an loose stones caused us to bless the firm for thei excellent foot oiler, which left both hands free to pilo the machine between the worst patches of road. Th long pull up Cleeve Hill towards Cheltenham wa accomplished on the 3¾ to 1 top gear, which is n



THE RISING SUN HOTEL AT THE TOP OF GAMBLES LANE.

The hill was christened "Rising Sun" after the hotel, when it was included in a trial some few years ago, and this name has clung to it ever since.

oad Tests of New Models.—

nean performance for a standard touring machine fitted vith a strong sidecar and a passenger of fully average veight.

Lunch was partaken of at the Rising Sun Hotel, situated at the top of Gambles Lane, or "Rising Sun Hill" as it is sometimes called. After lunch the nachine was closely inspected all over, but beyond ightening a slack oil union we could ind no possible excuse for tinker- ng. Gambles Lane was climbed with ease, but as the engine had had ime to cool down the machine was un part way down, turned on a sharp gradient and restarted on the clutch. This was a ine test of engine and transmission, and both stood the strain in the best possible manner, the clutch engaging sweetly but firmly, and the engine picking up gamely n spite of its load, and coming over the top of the hill as fast as at the first attempt. While in the neighbourhood it was decided to have a look at Post Office Hill, which lies a little on the Winchcombe side of Rising Sun.

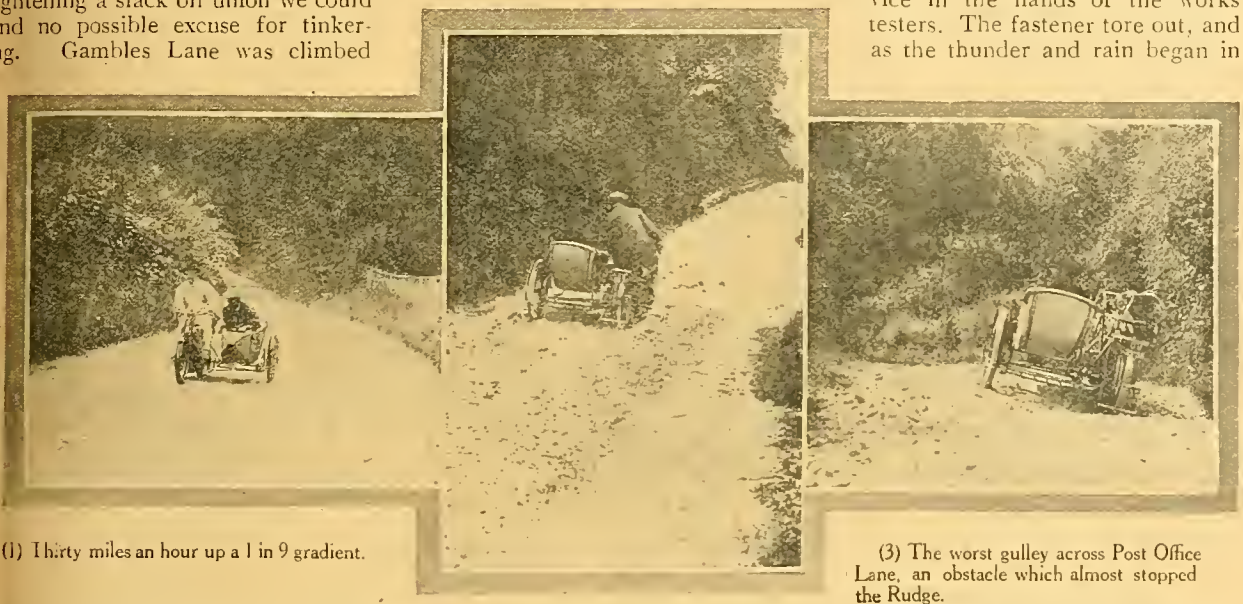
Post Office Hill.

Accordingly we dropped down the hill, the surface getting gradually worse and worse until on the steepest part the loose stones were so deep and the cross gulleys so awful that it really seemed hardly fair to drive the machine over it. However, having come so far the trip had to be made, and the Rudge was turned and the climb essayed. Ample power was there, but pace was impossible; in spite of this it climbed steadily upwards with the front wheel all over the road in consequence of the appalling surface, and the engine plugged away with no sign of a knock in spite of the comparatively high bottom gear ratio. Suddenly a stone jammed in the belt rim and threw off the belt and so spoiled a fine climb. However, the worst of the hill had been conquered, and the photographer seized the opportunity to obtain some views illustrating the surface. While thus employed a descent to the bottom was made, and after slithering upwards till the better surface was reached, we picked him up and restarted on the clutch. The test was about as severe a gruelling as a motor cycle could reasonably have in one day, so the homeward route was taken. At Broadway a heavy storm came over the hills, and this we raced to Willersey.

A Simple Adjustment.

The sudden opening of the throttle proved to be too much for the belt, which had seen hard service in the hands of the works testers. The fastener tore out, and as the thunder and rain began in earnest a move was made to the inn to refit the fastener and await the passing of the storm. As soon as the rain ceased we made for the hill again, and slipped up with greatest ease. By the by, a large notice is now posted at the foot of the hill prohibiting its use for competition purposes. The day's work was over, but one more instance of clever Rudge design showed itself, for after the heavy rainstorms the roads in places were a series of pools, and in consequence a certain amount of belt slip was experienced. Fortunately when this occurred the neat little belt tension adjuster situated at the end of the rear spindle was remembered, and a turn of the little lever, which was done without stopping the machine, made an immediate improvement. A wet run into Coventry concluded an interesting day and a severe test from which the Rudge emerged with flying colours.

A new model Rudge is bound to attract considerable attention, and, from our experiences, the twin is as fine an example of a big machine as can be found, and it has given no trouble since it was first designed, a point which helps to prove that the firm's wide experience has been of great value in the new design.



(1) Thirty miles an hour up a 1 in 9 gradient.

(2) Ascending Post Office Hill, near Cheltenham, the surface of which is atrocious as may be seen from the photograph.

(3) The worst gulley across Post Office Lane, an obstacle which almost stopped the Rudge.

OF
THE MOTOR CYCLE
WILL BE ISSUED ON THURSDAY JULY 23RD

MILITARY MOTOR CYCLISTS.

Two Exercises in Hampshire Shortly Described.

ON June 8th and 9th Staff exercises were held in Hampshire, in which the Signal Service, with the now indispensable motor cyclists, were employed. The following makes of machine were represented—Blackburne, Bradbury, Triumph, Ariel, Matchless, and Douglas.

The actual scheme of operations was rather complicated, and would be of little interest to the reader. Roughly, after an advance to Alton, on the 8th, the force was driven back on the 9th to Winchester.

Late in the afternoon of the 8th rain, which had been threatening all day, made its unwelcome appearance. Very soon the weak places in the telegraph cable were found, consequently main lines were "out of action" for some considerable time. It was at this juncture that the motor cyclists again proved their

(4) A few of the cars and motor cycles used in the manœuvres.

Military Motor Cyclists.—

worth. Orders for the night, and "operation orders" for the following day were sent out almost entirely by motor cyclists, many valuable hours being saved, and weary officers and men being enabled to obtain an early and well deserved rest.

The Cavalry Conk Out.

As on previous occasions, large sections of troops were represented by groups of officers in motor cars. *Apropos* of this, a rather amusing incident occurred. The writer was situated on the top of a rather long hill with a wireless office awaiting the arrival of a somewhat decrepit car representing the cavalry. A motor cyclist arrived, saluted, and said—"The cavalry have conked out on the hill, sir, but hope to be up shortly."

The operations were brought to a successful conclusion early in the afternoon of the 9th inst.

The motor cyclists under the writer's charge suffered from no mechanical derangements, the only troubles experienced being punctures; some dozen machines were employed.

On June 11th and 12th a "scheme" was again held in Hampshire under the direction of the War Office Staff. Some forty motor cyclists took part, a number of men joining on the evening of the 10th. The majority of the men were Special Reserve or Territorial motor cyclists with a sprinkling of civilians. The makes of machines represented were Triumph, 8 h.p. Matchless, Humber, Rover, Douglas, Pride of the Exe, Bradbury, and the ubiquitous Blackburne. The last-mentioned machines attracted considerable attention, and the slow running, flexibility, and appearance were generally admired.

The motor cyclists were divided into groups and attached to general headquarters, Army headquarters, and the four divisions. All motor cyclists, however, were under the direction of two officers of the Special Reserve Royal Engineers, motor cyclist section.

Although operations began at an early hour, the "traffic" was not very heavy until about 2 p.m. The driver of a Clyno and sidecar experienced a broken mudguard stay, and a Humber rider had to effect a tyre repair, the only mishaps in the early stages. It is probable that sidecar outfits will not in future be permitted, too much space is taken up in narrow lanes, and the machines are somewhat awkward to manœuvre among horses.

About 3 p.m. a move was made by nearly all the troops. In such cases an office is left until another "office" at the next position is "through," motor cyclist groups being sub-divided, some accompanying the party establishing the new office, the remainder stopping with the old office until the line is clear and then joining their comrades. An experiment was carried out which proved successful, thanks to the motor cyclists' ability to read maps accurately. A despatch rider was sent forward to receive instructions as to the exact position of the new office, returning to guide the officer in charge to the spot.

Despatch Riding.

A number of changes of position were made during the afternoon and early evening; there was a considerable amount of riding in consequence; later, affairs settled down, although a certain amount of work was done during the night.

Steady riding is the order of the day on these occasions; as a result there were practically no mechanical troubles. Motor cyclists of the Army headquarters did well, they had a large shed for the accommodation of their machines and a large shed adjoining for sleeping. One breakdown was reported during the night, a broken valve, the spare being rather a tight fit in the guide; this, however, was soon remedied. The enemy was steadily retiring and the majority of motor cyclists enjoyed a peaceful night. By 9 a.m. on the 12th the enemy had been finally repulsed. All returned to the Royal Engineer camp at Cheriton; here the array of machines was most imposing and attracted considerable attention. The men had a look round the camp while their mileages were being checked; one and all declared that they had enjoyed themselves thoroughly and were anxious to know the next occasion on which their services would be required.

The work performed was excellent. The motor cyclist is slowly but surely proving himself and his machine invaluable. The staff officers were full of praise for the indefatigable band and their trusty machines.

R.E.S.R.

THE A.C.U. SIX DAYS TRIALS.

General view of the machines lined up at Doncaster racecourse during the luncheon stop on the third day.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

From the West to Margate.

I am shortly riding from Bristol to Margate. I want to avoid London, but at the same time pass sufficiently near to be able to stop a night at some place whence I can run up to town for the evening and get back again so as to make an early morning start for Margate. Where would you suggest as a good spot for this purpose, and which road would you advise me to follow from Bristol to Margate?—H.N.

We should recommend you to stay the night at Croydon, which is within easy reach of London. Your best route would then be Bristol, Marshfield, Chippenham, Calne, Marlborough, Hungerford, Newbury, Reading, Twyford, Windsor, Staines, Kingston, Sutton, Croydon. Then continue through Farnborough, Sevenoaks, Wrotham, Maidstone, Charing, Canterbury, Sarre, Margate.

The Drawbacks of Paraffin as a Fuel.

Will you kindly inform me if it is practicable to run a modern 3½ h.p single-cylinder motor cycle on a mixture of petrol and petroleum, and, if so, what percentage of petroleum would be most practicable?—F.W.J.

It is quite practicable to run a motor cycle on a mixture of petroleum and petrol; in fact, a machine could be run on petroleum alone. It would not be worth running on a mixture of less than 50% of petrol, and then you would find it extremely difficult to start. In all probability it would be an impossibility to start on the mixture itself, and you would have to carry a reserve tank of petrol for this purpose. The drawbacks of using such a fuel are many. To begin with, violent sooting up would be experienced in the engine, also you would find the running to be very sluggish, and the engine would probably knock badly on hills. With an ordinary carburetter—that is, one not designed specifically for running on petroleum, it is almost an impossibility to deliver a mixture which does not cause violent smoking, but a mixture of 1 petroleum to 5 petrol increases the power of some engines. Another fault which is common to petroleum is its power of "creeping," and it is impossible to prevent it from getting all over the machine.

The Timing of Twin-cylinders.

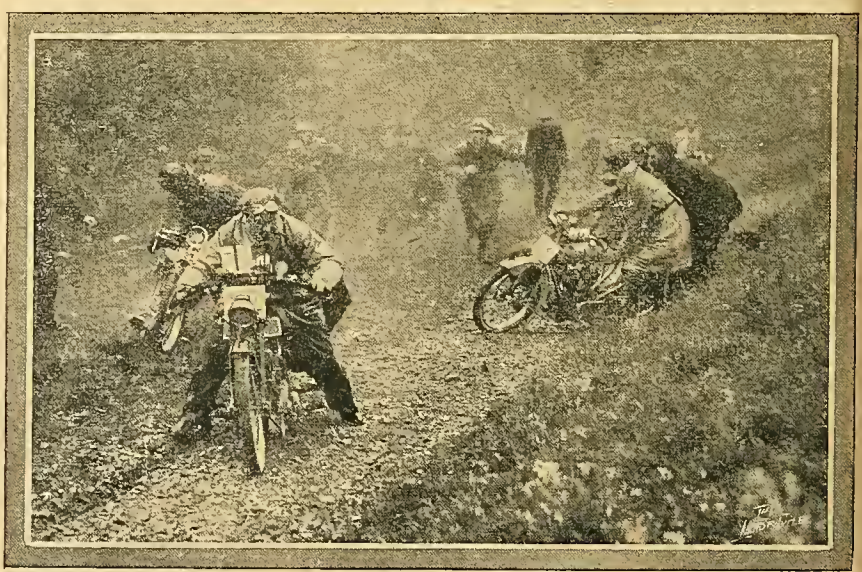
I have had the cover plate off the timing case of my twin 6 h.p. machine, intending to pack it owing to oil coming out on the top of the crank case. In doing so I have disturbed the timing wheels. There are two wheels with a cam on each which lift the tappets, and I take it that if I get one right the other must be right. I have reset them for the exhaust valve in both cylinders to close dead on top of the inlet stroke, but find that the valve opens sooner in the back cylinder than in the front one. If I reset it to open at the same time it does not close when the inlet stroke commences. Would you let me know which is right?—E.B.

Several V-twin engines have slightly different timings in each cylinder, and in this particular case we should advise you to get the most suitable timing from the makers. It is quite a usual thing to have a certain amount of overlap on the valves; that is, the inlet and exhaust being open at the same time for a short period. The usual timing for a cylinder is for the exhaust valve to open forty-five degrees before bottom dead centre and close on top dead centre, and the inlet valve to open five degrees after top dead centre and close twenty degrees after bottom dead centre.

Lighting and the Law.

I am purchasing a cycle car. Will it be legally necessary for me to have three lamps in front, or will one head light be sufficient? I am in the habit of leaving my motor cycle outside my club, and I never light my lamp at night when leaving it there. Will it be necessary for me to light the lamps on the cycle car while leaving it outside?—INTERESTED.

You must have two lamps in front to show the width of the vehicle. If you leave your car outside your club you must keep the offside lamp and the tail lamp alight. It is illegal to omit to do this.



THE A.C.U. SIX DAYS' TRIALS.

J. W. Moffat (3½ h.p. Sunbeam), Graham Price (5-6 h.p. Bat), and another in difficulties on Littonstack Hill.

Ignition Cut-out.

? I am desirous of fitting a cut-out to the ignition of my machine, and as the magneto does not possess an additional terminal for this purpose, I propose carrying a wire from the sparking plug, up under the knee grips, to the top tube of frame, on which I would have a neat switch of the "permanent" on or off variety, thus doing away with the necessity of keeping one's finger on the switch all the time. Do you see any objection to this arrangement, and does the use of cut-out in any way harm the magneto? Also, is it likely to save exhaust valve from pitting when it is lifted by cutting out the spark?—J.H.L.

We should not recommend a high tension cut-out. It may result in your getting a shock whenever you touched the frame and the current was earthed. It is quite easy to get a special contact breaker cover with a terminal from the magneto people. A low tension cut-out does not harm the magneto in the slightest degree. It would not affect the exhaust valve in any way, but when the switch is off it has the result of polishing up the magneto points if you are descending a long hill, as no sparking takes place.

A Tour in Ireland.

? I propose making a tour of a week to ten days' duration in Ireland, but as I have had no previous experience of motor cycle touring, or of Ireland, before venturing I should be glad to have some advice from you on the subject. My machine is a 3½ h.p. single-cylinder, built in 1908, but was recently at the makers, where it was overhauled and modernised by the fitting of a two-speed gear and free engine. I am taking a friend (about 10 stone) as passenger on a seat rigged on the carrier. I intend starting from Cardiff and running to Fishguard, crossing from Fishguard to Rosslare, touring for about 400 miles, and returning *viâ* the same sea passage or *viâ* Dublin and Holyhead. Is this scheme practicable, and what route would you advise in this part of Ireland? What sort of roads would I encounter, and what distance should I cover per day comfortably without rushing it and being too hard on the mount? How shall I be placed for obtaining spares, accessories, and necessities, and what spares should I carry to start with?—W.C.A.

The touring scheme suggested in your letter is quite practicable. The Irish roads are rough in places, but, generally speaking, have been much improved of late years. But you must not expect to find much good going. You could very comfortably cover up to 100 or 120 miles per day. For hints on spares, see "Motor Cycles and How to Manage Them" (obtainable from these offices, price 1s. 2d., post free), where a list of spares for touring is mentioned. If you write to the Auto Cycle Union, 89, Pall Mall, S.W., or the A.A. and M.U., Whitcomb Street, W., they would map out a good route for you to take, and give you very full information. We fear you may find it difficult to steer on a bad road with a passenger on the carrier, and would advise a sidecar if possible.

Exhaust Valve Trouble

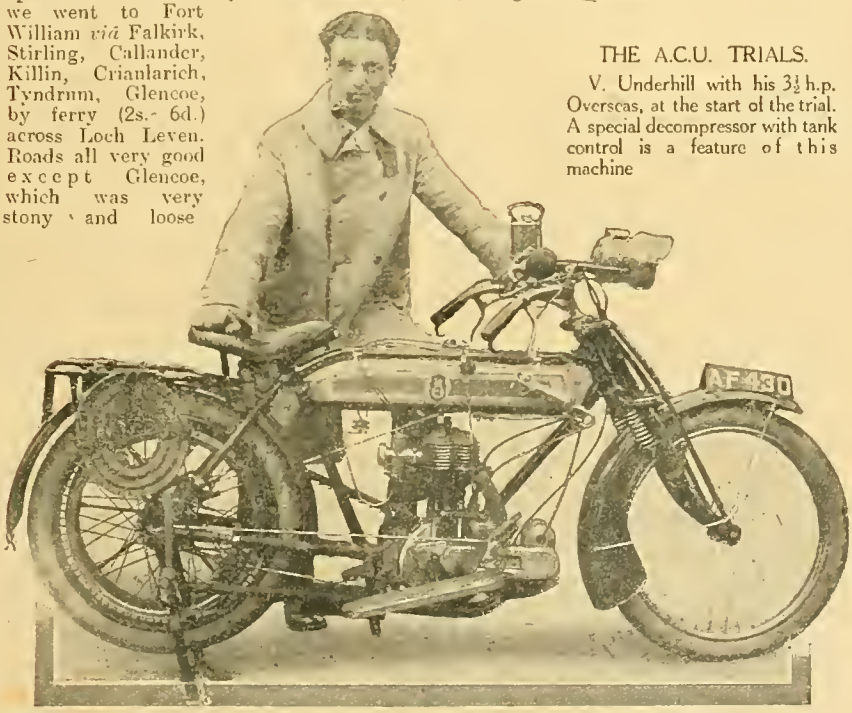
? I ride a 1913 3½ h.p. single-cylinder, two-speed geared machine, which I use solely for sidecar work. I find the engine very severe on the exhaust valve—indeed, I have only had the outfit a few months and I have burnt out four valves already. If I do 100 miles or so it is all I can manage without having to take the valve out, and lately there has developed a habit of the exhaust valve bending. I give as much air as possible without misfiring, and have tried smaller jets without any improvement, and I should be glad if you would give me your opinion as to what is wrong.—F.C.S.

It is probably a matter of rather stronger exhaust valve springs being required. A weak spring would allow the valve to bounce on its seating and thus to get burnt, and probably bent and broken as well. It would be a good plan to verify the valve material and see if this is of a sufficiently high quality; in fact, you might query the makers of your machine on this point, and tell them your troubles, when doubtless they will help you. In addition to driving with as much air as possible, also see that the spark is as far advanced as may be without causing the engine to "knock."

READER'S REPLY

Swindon to the Highlands.

Your correspondent, "A.L.M.," in *The Motor Cycle*, July 2nd, may be interested to hear of a trip carried out by myself and a friend last year to Scotland. Leaving Birmingham at 2 a.m. on the Saturday before August Bank Holiday, we reached Edinburgh by 7.30 p.m. The route taken was *viâ* Derby, Doncaster, Wetherby, Newcastle, Otterburn, Carter Bar and Galashiels. We stopped about 1½ hours at Wetherby. The next day we went to Fort William *viâ* Falkirk, Stirling, Callander, Killin, Crianlarich, Tyndrum, Glencoe, by ferry (2s. 6d.) across Loch Leven. Roads all very good except Glencoe, which was very stony and loose but not stones to do any harm. Next day *viâ* Loch Laggan, almost to Kingussie, but turning right-handed and going down Glen Garry, through Blair Atholl, Perth, Inverkeithing, Edinburgh, to Otterburn, and home next day. The run from Fort William to Blair Atholl was rather rough. Distance, 986 miles. Machines, both single-geared Triumphs, geared 4-1. One puncture between us. Magnificent scenery. Actual riding speed averaged about 21 m.p.h., and only on the first day and the last did we light our lamps. If your correspondent cares to communicate with me through the editor I shall be pleased to write him further.—A.M.S.



THE A.C.U. TRIALS.

V. Underhill with his 3½ h.p. Overseas, at the start of the trial. A special decompressor with tank control is a feature of this machine

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor

"J.S.C." (London).—Binks carburetter on Scott. Economy and assistance in slow running

"J.A." (Derby).—26 × 2¼in. Stelastic tyres for use on the back wheel of a 3½ h.p. single.

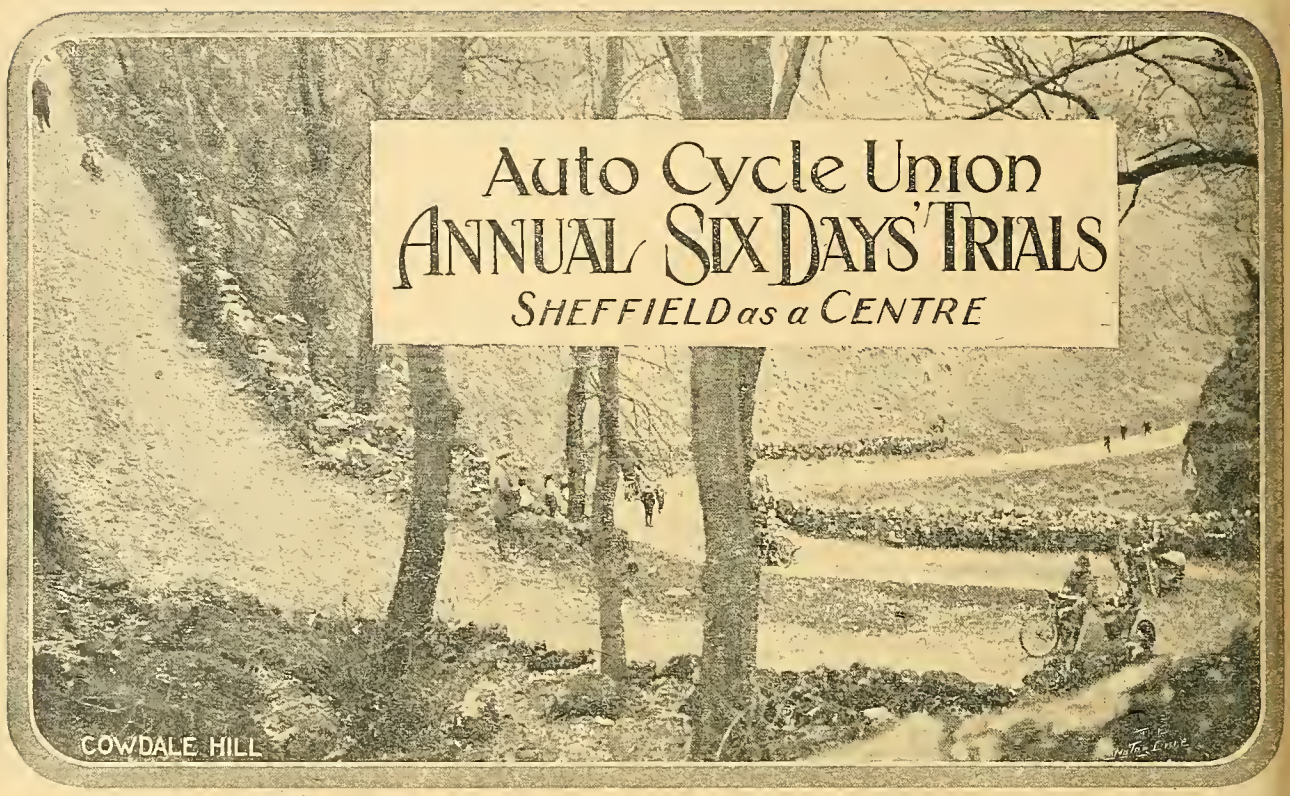
"E.L.R." (Upper Tooting).—2½ h.p. light tourist New Imperial. Reliability, petrol consumption, and vibration.

"P.T." (Chester).—Single-geared Levis, Connaught, and Peco. Reliability, hill-climbing and petrol consumption.

"J.G.K." (Nigeria). — P.V. spring frame. 180° Brough engine. Any defects. Simple counter-shaft gear suitable for this combination.

"B.D." (Hampstead). — Suitability of lightweight for India, with special reference to two-strokes. Liability to overheating.

"S.A.M." (Newbridge).—Scott. Reliability, petrol consumption, spring forks, loss of compression in crank case, two-speed gear and lubrication.



Auto Cycle Union Annual Six Days' Trials

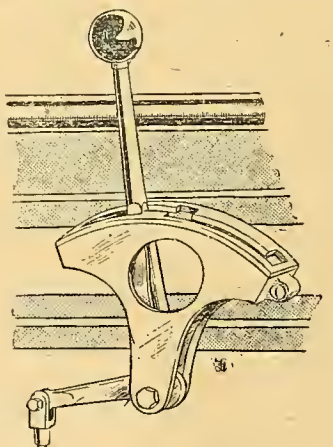
Sheffield as a Centre

TUESDAY'S ROUTE: 126 Miles. Sheffield, Bakewell, Matlock, Wirksworth, Leek, Rudyard (lunch), Wincle, Cowdale, Stoney Middleton, Hathersage, Sheffield.

OUR last week's report of this eventful trial left the competitors at the midday halt on Tuesday, Rudyard Lake being visited a second time. Here we learned from W. H. Egginton that the rear spindle of his 8 h.p. Enfield sidecar had broken, but he decided to continue so long as the wheel would stand up. Others who did not arrive at the luncheon control were Hugh Gibson, the frame of whose Clyno sidecar outfit had broken due to hurrying over very rough roads in order to catch up time, and W. A. Davenport (Lea-Francis), who reported having been run into on a hairpin bend by R. M. Davy (Norton), whose machine was undamaged, but not so the Lea-Francis, which sustained a buckled front wheel. Haslam (Premier sc.) and Watson (Ariel sc.) were in high spirits, as they were the only competitors to have piloted successfully 3½ h.p. sidecar combinations round the course, and their performances are indeed the wonder of the other riders—some of whom are not slow to grumble at the undue severity of the test.

Tuesday's run generally was far easier than that of Monday, which may sound paradoxical, seeing that the competitors followed practically the same route but in a reverse direction. But the state of the roads mainly accounted for the severity of the first day's trip. The narrow and twisty course, however, caused the competitors a good deal of trouble to average the necessary 20 m.p.h., and especially does this remark apply to the passenger machines.

The first point of interest after Buxton was that winding but not very steep ascent known as Cowdale, which was negotiated during the Spring One Day Trial. Its surface looked fairly good, but it was in reality of a treacherous nature, and many of the competitors, especially those who drove sidecar combinations and three or four-wheeled vehicles, had great difficulty owing to wheel slip. Now this trouble was due to a variety of causes, apart from the greasy nature of the surface. In the case of the four-wheeled cars weight distribution was an important factor, while the single driving wheels of the sidecars and three-wheelers, also coupled with weight distribution, mitigated against efficient road grip. We feel confident, however, that certain patterns of tyres would in similar circumstances be more effective than others. Quite a large crowd was present to witness the competitors ascending this well-known hill and negotiating the two bad corners, and there was indeed plenty to see.



The three-speed gear quadrant on the Rex-Jap.

Observations on Cowdale.

After Wilkin (2¾ Levis) and Walters (P. and M.), who led the procession, had made really excellent climbs, Brownsort (A.C.) came to a standstill through back-wheel slip. F. Smith (Clyno sc.) and S. Parker (Enfield sc.) both made sensational ascents in quick succession. First the front wheels refused to steer, then the complete machines swung from side to side; but both drivers, with consummate skill and daring, went up in fine form. Chapman (Triumph) was badly baulked. The 5 h.p. Montgomery came up well, but skidded about a good deal. R. C. Davis (Chater-Lea sc.) climbed well, but, like the other sidecarists, he could not steer in a straight course. W. James (Morgan) suffered badly from wheel slip, while Scott's A.C. came to a standstill for the same reason, whereupon F. Dover (on this occasion a steward, and for the first time in nine years not a competitor)

A sidecar competitor at the bad corner on Rowsley Hill.

leaped upon the tail of the body, with the result that the extra weight in the right place allowed him to restart. B. G. Gray (Sunbeam) made an excellent ascent, but was hindered by the A.C. Haddock (A.J.S.) had to dismount. C. O. Henfrey (Ariel) skidded right round in the reverse direction to that in which he was travelling, but saved himself from a fall. P. Pratt (6 Bradbury sc.) almost came to a standstill, but saved the situation by getting the passenger to bump on the carrier and so obtaining momentary adhesion with each bump. Plint (Dayton) dismounted and ran; Hardee (7 Matchless sc.) came to a stop through wheel slip; while Ellis (Morgan) was in a similar predicament. Hunt (Campion sc.) was hampered by the aforementioned competitor.

The crowd was both enthusiastic and appreciative, and heartily cheered the excellent climbs made by North (Ariel), Pilkington (Rex-Jap sc.), and Richards (5 Sun). R. Pearson (2½ Clyno) got up all right, but indulged in a small amount of foot-slogging. Kerr (3½ N.S.U.) took the hill well and without apparent effort, and fine exhibitions of driving were made by Drysdale (2½ Connaught), Francis (Lea-Francis), H. G. Dixon (3½ James), Lea (Lea-Francis), and C. R. Collier (Matchless sc.). Cook's twin A.S.L. skidded from under him on the bend while going splendidly. This was his first involuntary stop. The fact that the men are started in the same order every day tells hardly on those who leave late, as they have always to take the hills after the surface has been cut up by their more fortunate *confrères*.

Contrasts on Jacob's Ladder.

Dropping down Kingsterndale, the negotiation of the acute hairpin on to the Buxton-Derby road caused much trouble once again. F. W. Applebee, whose Motosacoche has been going so well, failed to pick up, so that he will lose marks, as this point is in a non-stop section. At the foot of the hill leading out of Miller's Dale we passed R. C. Davies on the Chater-Lea sidecar, who was making a second attempt, though certainly not on account of lack of power, as his big engine has played with most of the test hills up to the present.

After descending Stoney Middleton the riders were confronted with Jacob's Ladder, where many were expected to meet their Waterloo, but, surprising to relate, what seemed next to impossible on Monday in the grease was rendered comparatively easy when the surface was practically dry. The passenger machines, by the way, were diverted to the left through Eyam, as Jacob's Ladder is almost too narrow even for solo climbs. There were several failures, the lower powered machines not showing up so well on this occasion. We observed all the A.J.S.'s, Sunbeams, Triumphs, Douglases, Lea-Francises, P. and M.'s, Humbers, Scotts, and Blackburnes make clean ascents. Drysdale (Connaught) almost collided with the wall. The easiest and best climbs were made by Dixon (James), Jesse Baker (Scott), Pearson (two-stroke Clyno), Nokes (Sunbeam), and Gibb (Douglas). Hall (O.K.) was the first to dismount; Drew, on the New Imperial, had bad luck owing to the gear jumping out of engagement when going well; Ayling (Dayton) footed vigorously, but got his lilliputian engine to the top; Allday (James) was good; and Brown (Rover) excellent.

Novel Way of Climbing.

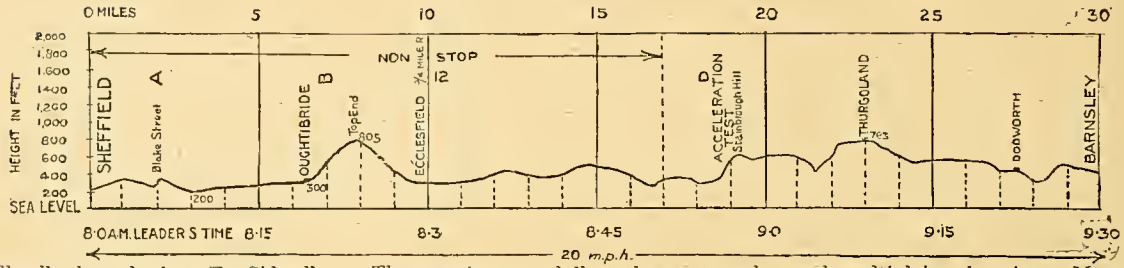
Roberts's Blackburne got up well, but seemed to have a ringing noise in the engine; Davy (Norton) wobbled about the road, and Heinzel (2 N.S.U.) once again got his six-speed mount up in good form; Ross (Triumph) had to crawl behind him nearly all the way. Plint (Dayton) caused the yokels amusement by walking with his machine between his legs, the little two-stroke engine tugging away manfully on the 1 in 4·5 gradient. B. J. Simms (4½ Bat) stopped with gear trouble and was obliged to withdraw. This is the second Bat rider to experience gear trouble, which is distinctly hard luck as the Bats have performed exceedingly well as a bunch and bear no outward sign of the severe work they have already undergone.

At the top of this hill there was another left hand hairpin to catch the unwary, and thereafter the route was through Hathersage over a stretch of third rate "Colonial" road, the machines in places bouncing from one half submerged boulder to another; they then made their way home.

E. B. Glissan (6 h.p. Rex sidecar) rounding one of the sharp bends on Stoney Middleton

SECTIONS OF THE PRINCIPAL PORTIONS INCLUDED IN EACH DAY'S ROUTE.

WEDNESDAY MORNING



The roll-call showed that E. Sidwell was an absentee, this rider having misjudged the speed of his Excelsior sidecar at the hairpin on Station Hill, Bakewell, and run off the road, bending the front forks.

WEDNESDAY'S ROUTE: 116½ Miles. Sheffield, Stainbrough Hill (acceleration test), Barnsley, Marr, Doncaster (speed and brake test. Lunch. Quick starting test), Maltby, Chesterfield, Stack Hill (re-starting test), Dronfield, Sheffield.

Wednesday's run was easy, and included nothing in the shape of a hill which caused the competitors any anxiety, but it was full of interest, as such useful tests as those of acceleration, speed, brakes, starting from cold, and restarting on a gradient formed part of the programme.

Not a mile and a half from the starting point, and right in the city, is a hill known as Blake Street, reputed to possess a gradient of 1 in 4 for a mile. This, however, was a gross exaggeration, as we doubt if the hill is steeper than 1 in 5, and it is certainly not much over a quarter of a mile in length. The surface consists of rough cobbles. A huge crowd witnessed the climb, and when tackling the hill with no start, after negotiating a right angle bend, the men had to face a mass of people which parted as they approached. Two sporting Sheffield policemen did their best, but they were not of much avail. We waited to see a few climb the hill, and as all took it easily we did not delay long.

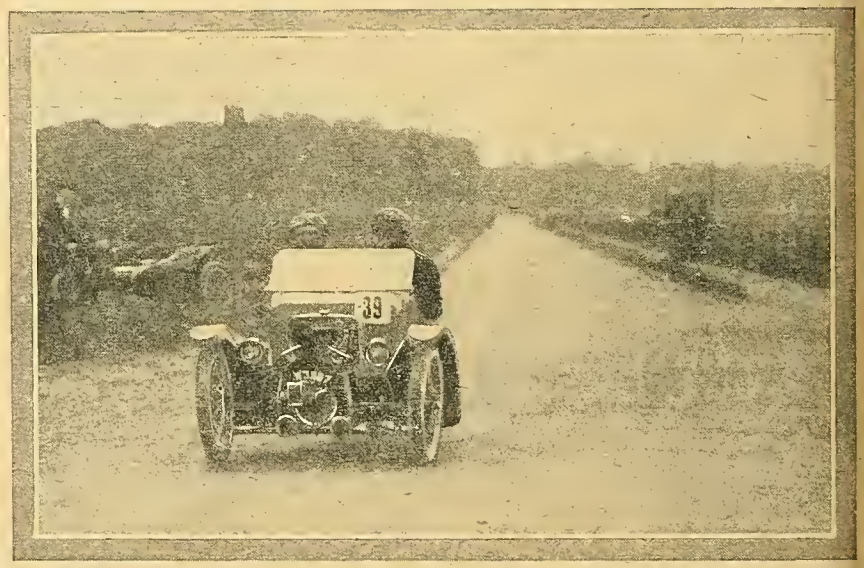
Excellent ascents were made by Wilkin (Levis), May (A.J.S.), Langton (Ariel), and Taylor (Imperial), who cleverly hugged the offside gutter, thereby taking the smoothest course and, incidentally, sweeping the erring spectators on to the pavement. Brownsort (A.C.), Robinson (N.U.T.), Nott and F. Smith (Clyno sc.), North (Ariel), and Chapman (Triumph) all made light work of the hill. Walters (P. and M.), who led the way with Wilkins, stopped with an air lock, but restarted and got up with ease.

The morning was dull at the start, and as we left Sheffield, which took a long time on this occasion, it began to rain slightly, causing the dust to adhere to one's goggles in an unpleasant manner. Not long after the tramlines had been left behind a level crossing of a fearfully bumpy nature had to be negotiated, which was immediately followed by a terribly rough road ascending over the moors, but afterwards the surface became better, and finally near the summit of a long average hill known as Stainbrough the acceleration test was being held.

The Acceleration Test.

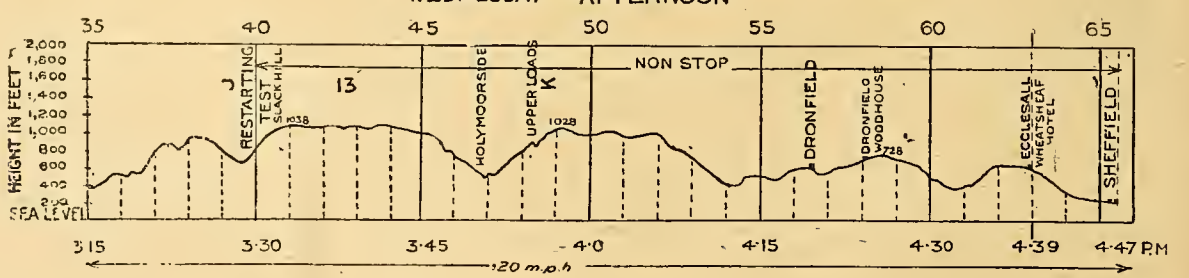
Fifty yards of the hill had to be taken slowly, and 200 yards fast, the speeds being not less than 5 m.p.h. nor faster than 25 m.p.h. Marks were calculated by dividing the fast speed by the slow speed and multiplying by six. Many of the motor cycles travelled very slowly indeed over the whole fifty yards, but those riders who knew the ropes travelled slowly for twenty-one seconds and then accelerated, thus entering the fast portion with a flying start.

It was surprising to see the number of men who spoiled their fast ascent by changing up too early, and those who kept in their second speed for the low portion and got away on it for the fast stretch scored, as no speed over 25 m.p.h. was of any advantage. Frank Smith (Clyno sc.) and North (Ariel) were doing the test as we arrived, and performed well. Chapman (Triumph) kept his second speed in engagement and made quite a pretty performance. Kerr (N.S.U.) came through the slow test well enough, and was getting away well



W. James (8 h.p. Morgan) at the finish of the speed test on Wednesday of last week.

WEDNESDAY AFTERNOON



The A.C.U. Six Days Trials.—

in the fast portion when his machine stopped with a jerk, and it was found that his pulley gear had jammed owing to a bent operating rod. He thus lost his three lower speeds, and was consequently left with the three higher speeds of his hub gear. Finch (Premier) changed up rather too early. Phillip (Douglas) performed well on both portions. Nokes (Sunbeam), J. Stevens (6 A.J.S.), and Clayton (Triumph) were well among the best. Heinzel's tiny N.S.U. did the slow test well, but the engine appeared too small for getting away in the fast portion. Star performances were made by Baker (Scott) and Leslie, who was riding a similar machine. Pratt (Bradbury), who was using one of the latest Binks carburetters, came up at a very slow speed, with the engine firing perfectly, and got away well after crossing the line. Pearson (two-stroke Clyno) kept his engine turning fast and the clutch slipping, and made a remarkably fine performance. Gray (Sunbeam), on beginning the slow test, said, "Do I go straight on?"—a remark which caused some amusement, as there was certainly nowhere else to go.

The Finesse of Timing.

Excellent powers of acceleration were shown by the Matchless sidecar combinations driven by Hardee, C. R. Collier, and Guest. Lovegrove (Scott) appeared to improve his slow speed climbing by application of the front brake. Turvey (Triumph), who made quite a "star" performance, was one of the wily ones, and took his own time by the aid of a wrist watch; Hunt (Campion) did well; Slater (J.B.S.) was timed by his passenger, while another passenger counted the seconds one to twenty-one, and then the driver opened up his engine.

As a matter of fact the exact time calculated by a mathematically minded spectator was 20.4 seconds. Good exhibitions were made by Roberts and Holroyd (Blackburnes), E. Williams (A.J.S.), the Calthorpe, and Eli Clark (Leader sc.).

The Speed and Brake Test.

Through Barnsley and Hickleton the route actually lay over main roads for once in a way, but the black dust in this Yorkshire coalfield district made one's eyes smart uncomfortably. Near Marr we overtook A. F. Plint on the little 1½ h.p. two-stroke Dayton with the cylinder off. This rider had actually been able to get ahead of time in order to remove the cylinder and scrape it and the piston clear of carbon in order to gain extra benefit in the speed test.

On arrival at Doncaster the riders were diverted to the left in order to enter the race course from the far end and run towards the grandstand. The track was exactly the same as that used in the Doncaster Speed Trials a month ago. Some excellent speeds were accomplished, but the standards set up were very ambitious indeed. For instance, the cycle cars were expected to average 40 m.p.h., which is asking too much from all of them, notwithstanding the fact that most are semi-racers stripped of all unnecessary impedimenta. An unfortunate accident happened to J. Richards, who has been showing up so well on a 6 h.p. Sun-Jap. This rider had complained of feeling unwell at the start, and in the speed test he was noticed to wobble badly; he allowed his engine to keep running, the wobble increased, and finally the rider was thrown at nearly 50 m.p.h. in the centre of the track, though, fortunately, escaping with cuts and bruises. His front tyre was wrenched off, and every spoke in the back wheel broken. Francis (Lea-Francis) accelerated in good form, but his gear jumped out of engagement and he was timed again.

The brake test which immediately followed was an unnecessary complication. Few understood what to do, and instead of approaching the test at the requisite 20 m.p.h. crawled in at varying speeds. Most stopped in ten to twenty yards, but some did better than this. As a matter of fact, the idea of a brake test at all on level ground seems farcical when one considers that on Monday and Tuesday the competitors were descending 1 in 4 gradients continually, and if their brakes had not been efficient it is questionable if they would have survived to tell the tale!

Hawkes, on the Victor cycle car, broke a belt pulley in pulling up suddenly, but replaced it and continued.

The Starting from Cold Test.

The arrangements at Doncaster generally were splendid, and after an excellent lunch at the racecourse and a welcome rest, which the competitors much appreciated, the machines, which were ranged in double line and in crescent formation, engaged in the starting test. This was carried out by extending a line fifty yards in length from the machine which was being tested, the watches being held by Mr. F. T. Bidlake (start) and Major Lloyd (finish). Solo machines had to cover the distance from the word "go" to the end of the line in forty seconds, sidecar machinists sixty seconds, and cycle cars in three minutes. Passengers were allowed to take their seats before the start, but the drivers had to stand clear of their machines till permission was given. Most of the motor cycles got away with ease, but several drivers started with their stands trailing, which did not, as it should have done, involve penalisation. Wilkin (Levis) got his engine to fire in twenty-five yards. Walters (P. and M.) did not shine in this test. Brownsort started up his A.C. at the third pull up of the handle. Nott's Clyno fired on the first stroke of

F. C. North (3½ h.p. Ariel) in the quick starting test.

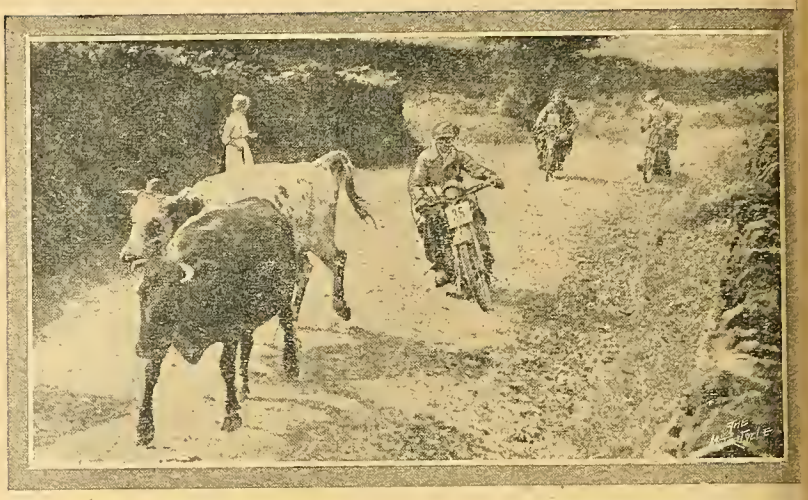
The A.C.U. Six Days Trials.—

the kick starter, while Pratt (Bradbury) was the only other out of forty-five or so who succeeded in doing so. Here we noticed that the back wheel of Chapman's Triumph had three bad dents in the rim. Parker (Enfield sc.) had to be pushed off. Kerr (N.S.U.) injected petrol. Applebee did likewise, but made a rather poor start; but when the engine did fire the machine almost left him behind. Plint (Dayton) got away very smartly. Davis (Chater-Lea sc.) started his engine on the second kick, and got going very promptly. Baker (Scott) started his engine on the second kick, went off smoothly and quickly, and put in his top with such energy that the back wheel raised a cloud of red dust as it spun round. Some amusement was provided for the waiting competitors by a piano organ, at the grinding of which some took a turn.

Soon after Doncaster, Woodhouse, who, it will be recalled, was driving Silver's Quadrant sidecar, stopped with a burst rear tyre and a repair was beyond hope. Woodhouse ascribed the burst to his quick stop in the brake test. The other competitors continued to run most regularly over much improved road surfaces, only an occasional puncture causing delay, Kerr (N.S.U.) being particularly unfortunate in this respect.

The next item of interest was the restarting test on the single figure gradient of Slack Hill between Chesterfield and Matlock.

The performances here were generally very good. Some had no free engines and had to resort to pushing on the low gear. Taylor (New Imperial) was one of these unfortunates, and, furthermore, failed to get his engine to fire. Chapman (Triumph) restarted nicely at the second attempt, but Robinson (N.U.T.) overshot the mark.

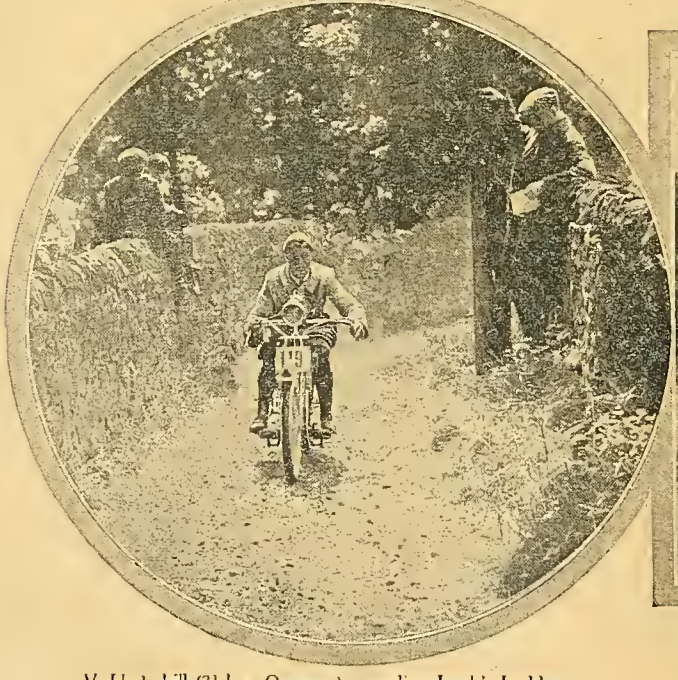


A scene on Thursday's run. C. R. Nokes (3½ h.p. Sunbeam) and S. Phillips (2¾ h.p. Douglas) baulked by two non-competitors.

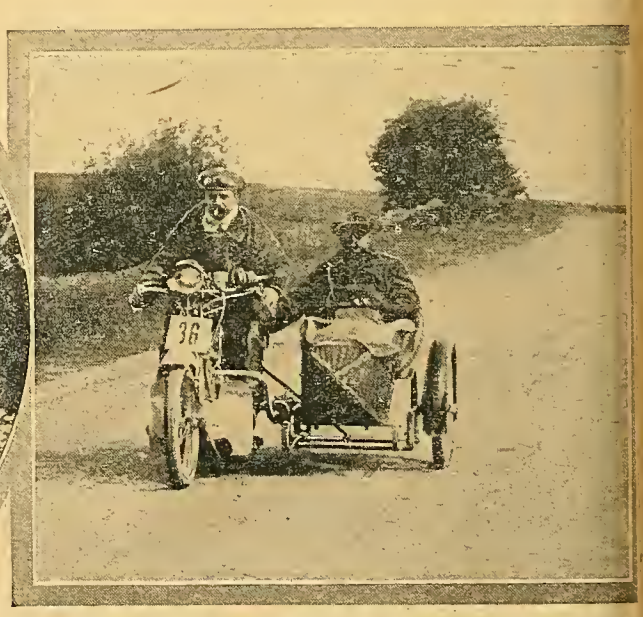
There was a good crowd of spectators, and when Frank Smith let the clutch in rather hurriedly and caused the front wheel to lift up, the spectators scattered in all directions.

Too Fast for the Timekeeper!

The P. and M.'s and the Sunbeams (Nokes in particular) made fine restarts, also the Lea-Francis pair. Boxer (Bat) got off the mark like a shot—so fast, indeed, that he knocked over the timekeeper, Mr. A. V. Ebblewhite. The tests among the later arrivals were carried out in the rain, but the leaders of the string now on the moors near home were experiencing a memorable soaking. The rain came down so suddenly and so fast that soon the riders were drenched. In the last non-stop section of the day Baker (Scott) broke a chain, and when only a hundred yards inside the section he experienced a puncture. Ellis (Morgan) was soon in a like predicament, but continued on the rim. Near Dronfield James (Morgan) took an S bend very quickly, and bent the steering arm, and it took him threequarters of an hour to rectify matters. Egginton (Enfield) is now going splendidly again, with a new spindle in position; the old one was not broken, as he suspected, but was ground down very thin. During the rainstorm he produced a most effective V-shaped celluloid screen for his passenger, which protected her splendidly. A large number of riders reported non-stop run.



V. Underhill (3½ h.p. Overseas) ascending Jacob's Ladder.



Where good roads were encountered. A. J. Stevens (6 h.p. A. J. S. sidecar) crossing the moors near Bakewell.

We were not afraid to enter the

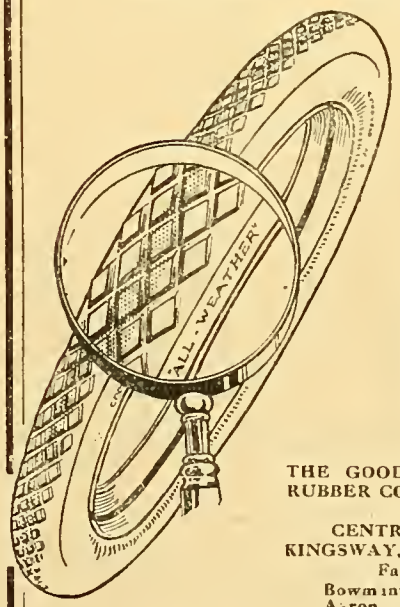
The Famous "Blue Streak" Goodyear

is now obtainable in England from the principal stockists and tyre dealers. In 1910 the sales of Goodyear motor cycle tyres totalled 1,176. In the following year 27,562 Goodyears were sold. In 1912 the sales jumped to 98,463, and in 1913 over 120,000 motor cycle tyres left the Goodyear factory. Just consider these figures. They are of the utmost importance to every motor cyclist.
You know the reason? Simply this!

THE
GOODYEAR

Blue Streak "All-Weather" tread is built for safety, comfort and economy under every road condition in any kind of weather. On hard dry roads it rolls as smoothly as a plain tread tyre; on wet and slimy roads it grips with a bull-dog grip, and Goodyear Blue Streak holds the world's speed record of 2 miles in 36 secs., or 100 miles per hour.



It's the world famous All-weather tread that has built up Goodyear Blue Streak Reputation.

Note how thick the tread—how sharp the flat-topped anti-skid diamonds. Built for safety and economy.

Like Charley's Aunt

"Still running" is a remark very appropriate to Clinchers. Among the letters we have received from users we find hundreds where, not only has the tyre achieved stupendous mileage, but is still running. Here are a few details (originals can be seen at our offices and names supplied).

"5,601 and still good for much more."
"6,094 miles—seem good for much more."
"2,000 miles on back wheel, there are no signs of wear yet, in fact the tyre is practically new I have not had a puncture yet."
"4,500 miles and has never been deflated"
"11,703, good for another few thousand, it has not been punctured."

We could go on quoting these extracts for many pages. They all bear out the marvellous durability of Clinchers Not only in the durability, but in the absence of tyre trouble lies the strong advantage of Clinchers. They are easily detached and attached, needing no levers.

To last infinitely longer than all others and to give no trouble from first to last, you cannot ask anything more rigorous from a tyre—ask it, and get it, from Clinchers

THURSDAY'S ROUTE: 160½ Miles. Sheffield, Stocksbridge, Penistone, Holmfirth, Slaithwaite, Halifax (lunch), Luddenden, Hebden Bridge, Todmorden, Marsden, Bradfield, Sheffield.

Whatever may have been thought of the severity of Monday's route, that planned for Thursday was a great deal more difficult. It was a succession of steep by-lanes with the roughest surface—innumerable hairpins and cobblestones and pot-holes were the order. Twenty miles per hour over such roads was exceedingly difficult, indeed dangerous, for one had perforce to descend the precipitous declines at walking pace, and the only chance of making up time was on up grades, but speeding at any time was decidedly risky on Thursday.

Quite a respectable hill, which was not far from the start, was Holdworth, from the slopes of which there was a lovely view over a reservoir. Fox (Enfield) ran off the route by following an official car which stopped in a side lane. Catt (Triumph) came up comfortably and without apparent effort. The Ariels also did remarkably well, while Armstrong (Gordon), Clark (James), Price (Bat), Hunt (Campion sc.), Oliphant (Premier), Moffat (Douglas), J. W. Moffat (Sunbeam), Greaves (Enfield sc.), and Keel (N.U.T.) all made light work of the hill, and Slater (J.B.S. c.c.) came up the greater part of the hill on second gear.

Tinker's Hill.

The worst part of Tinker's hill had been cut out, but the first portion was fairly stiff. There were three sharp bends, and an appalling gulley near the top, which, however, had a six inch wide easy path through it for those who were lucky enough to see it in time. C. R. Collier and Hardee, both on Matchless sidecar combinations, Ball (Douglas), the Scott riders, Scott's A.C., Kirk, and other Ariel riders, Ross (Triumph), who passed Edwards (Bat) on one of the corners, all made clean ascents. The road continued to be very rough for some distance, and before joining the highway the down grade was very steep and dreadfully cut up by the recent rains.

Climbing up Stairs.

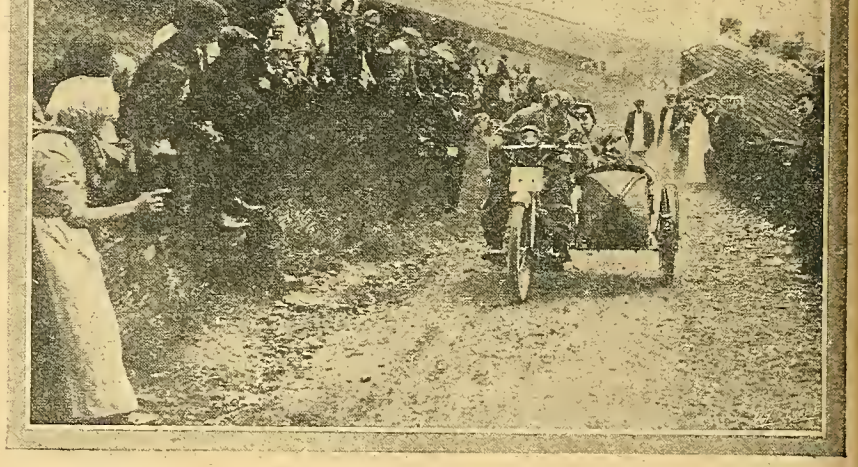
Scapegoat Hill was reported to be the most difficult on the morning section. It contained acute hairpins, but the competitors were now quite practised in this sort of thing and handled their machines splendidly, dropping down to low gear for the corners only and then accelerating finely. Several of the lower-powered machines came to a standstill. We noticed Egginton go up with a flat driving tyre on his Enfield. O. Birse (3½ N.U.F.) retired hereabouts owing to the fact that the low speed of his hub refused to act. As a matter of fact he had been running considerable risk, as on Monday his brakes were damaged in a fall o Grindon Hill.

One notable climb on the mornin section actually included a flight of steps Only the solo machines went up, but th competitors did not like it a bit.

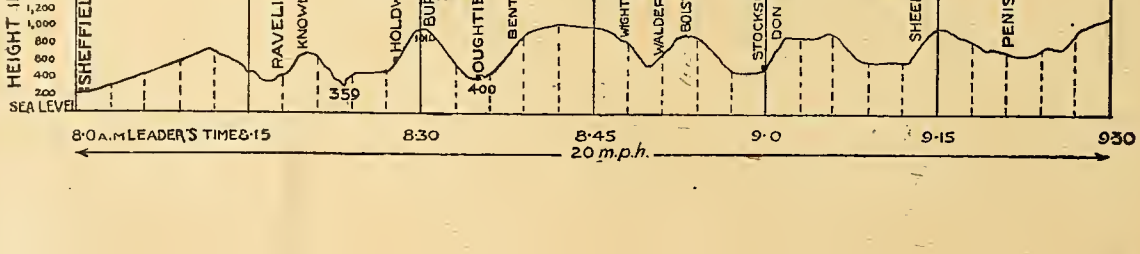
Near Halifax, Parkfield Lane wa descended with great caution.

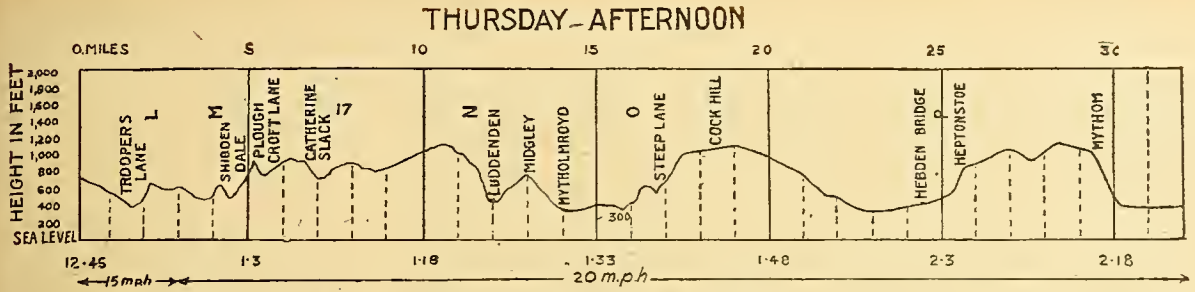
The Luncheon Stop.

Pilkington (Rex-Jap) and Frank Smit (Clyno) reported that they had climbe "The Staircase," and had not remarke the notice that it was only for solo machines. Smith dented his crank case in a gulley while making a clean ascent; Applebee (Motosacoche) had grazed the wall and scraped the skin off his fingers; Haddock (A.J.S.) had suffered a collapsed back wheel halfway to the luncheon stop owing to striking an enormous pot-hole



"IN THEIR CLOGS AND THEIR SHAWLS."
H. Finch (3½ h.p. Premier sidecar) near the top of Scapegoat Hill.





at speed and had to retire. The same pot hole dented many rims and threw one of the Bat riders. Wright (A.J.S.) withdrew at Halifax owing to his passenger having absolutely refused to face the terrors of the homeward journey. Complaints as to the roughness of the roads and the difficulty in keeping to schedule were heard on all sides; in fact very few indeed arrived to time. Cook (A.S.L.) said he thought it had been a fine sporting run, and May, whose A.J.S., good machine as it is, was almost *hors de combat*, took things very philosophically, although he had broken an inlet spring (said to be the first on record on an A.J.S.), and the handle-bar clutch control had been put out of action. Plint (Dayton) reported an excellent run save for one stop on Scapegoat Hill, while Wilkin (Levis) had been unlucky with tyres.

Immediately after lunch a fine example of a really steep and absolutely fair hill was encountered. It had a bad approach owing to the road being under repair at the foot, was very steep, had a good surface, and possessed several corners. Failures were uncommon, and the general excellence of the performances showed that the modern machine, suitably geared, will take any gradient, and, moreover, keep its tune, as this is the fourth day's hard running. Wilkin (Levis), Walters (P. and M.), May (A.J.S.), Brown (Rover), Langton (Ariel), Brownsort (A.C.), Robinson (N.U.T.), Nott and Frank Smith on their Clyno sidecar outfits, Chapman (Triumph), Clark (James), and Price (Bat) were among the many who made excellent ascents.

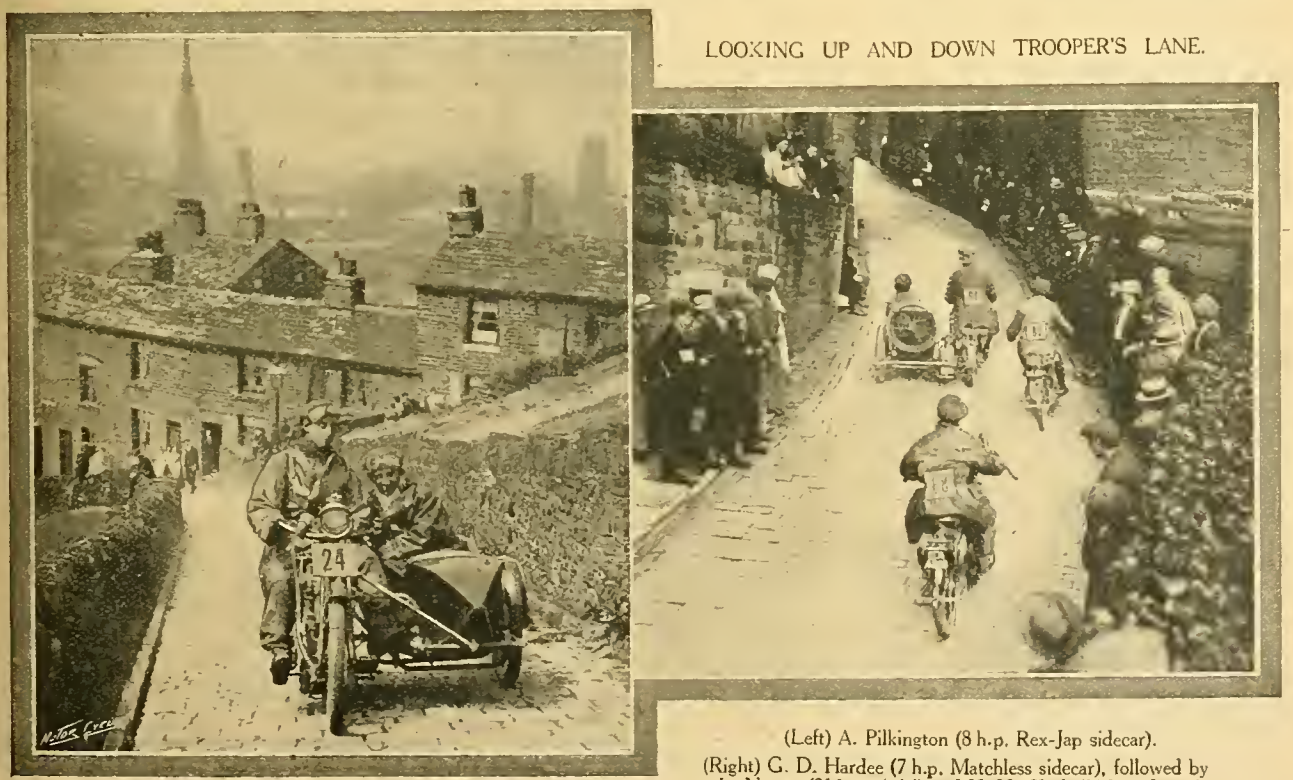
Moderate-powered Sidecars Score.

A mile or two further a steep ascent known as Lee Lane was encountered. This hill has a series of gulleys V-shaped and nearly a foot deep running tangentially across the road. But the gulleys were not so bad as the loose stones which covered the surface. Many a rider came to a standstill, and several fell over owing to the front wheels getting on to big stones, notably F. G. Ball (Douglas) and N. T. Downs (New Imperial). There were many excellent solo climbs, but the most remarkable performances were those of the three 3½ h.p. sidecar outfits still left in the trial, viz., Watson's 3½ Ariel and the two Premiers driven by Finch and Haslam respectively. Edwards (Bat) actually changed up before reaching the top, and his climb and also those of Oliphant (Premier), Ross (Triumph), Davy (Norton), Moffat (Douglas), and Shaw (P. and M.) were steady and sure in contradistinction to some other riders, who seemed to totter at the sight of so many loose stones. The cycle cars generally showed up exceedingly well, Gordon Armstrong's Gordon in particular, though Morgan and McMinnies, on their Morgan runabouts, seldom had trouble with the hills.

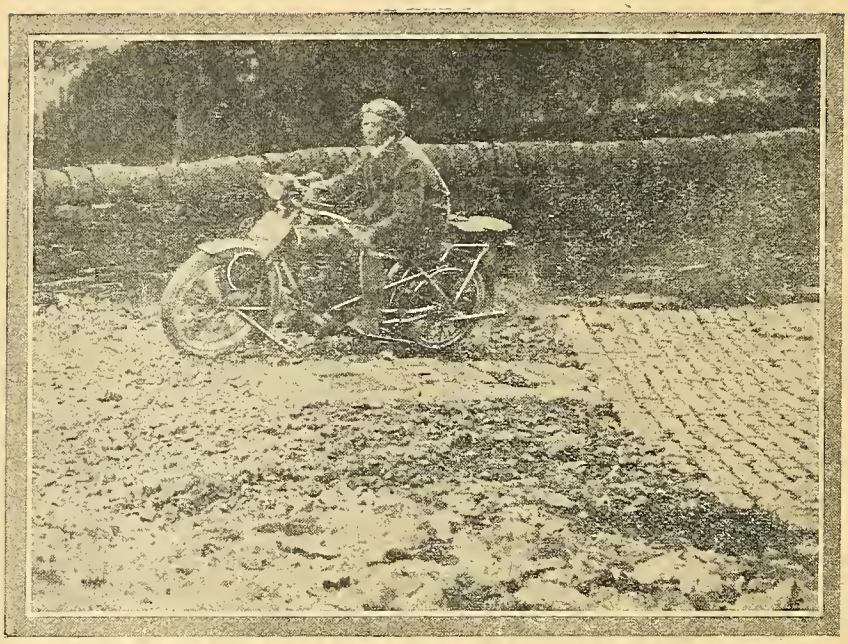
Two riders retired at this point, viz., Stanley Parker, who, in engaging the low gear of his Enfield sidecar suddenly, caused the front wheel to slew round and cannon the bank, so bending the forks, and Eli Clark, whose Leader sidecar burnt out the clutch.

A mile or two further on a stone got fixed between the tyre and guard of Pearson's Clyno and threw the rider, who had to dispense with the guard.

LOOKING UP AND DOWN TROOPER'S LANE.



(Left) A. Pilkington (8 h.p. Rex-Jap sidecar).
(Right) G. D. Hardee (7 h.p. Matchless sidecar), followed by L. Newey (3½ h.p. Ariel) and K. H. Clark (3½ h.p. James).



C. W. Smith (4½ h.p. Bat) on one of Thursday's tit-bits in the way of road surfaces.

Steep Lane was the third test hill after lunch. It was quite one of the best examples of pure steepness, length, sharp corners, and a hill which needed sheer skill to climb. The actual gradient on the steepest portion was 1 in 4, which we carefully measured. This was close to the top, and the near side of the road at this point was made into rough steps. We saw the Victor cycle car and Cook's A.S.L. make excellent ascents. There were, however, one or two failures. On the summit we found Watson (Ariel), who had been compelled to withdraw owing to a broken sidecar frame.

A Nearly Vertical Gradient.

Another hill of the series on the outskirts of Halifax was Blackwood Hall Lane, near Luddenden. There was a terrible gulley some way up, shortly after followed by an acute hairpin bend, the inner corner of which was stated by Major Nicholl to be 1 in 1½. The corner was so sharp and the road so narrow that most of the cycle cars scraped their wings against the wall, while several failures on the part of the motor cycles have to be recorded. These were: Finch (Premier), C. R. Collier (Matchless sc.), Fox (Enfield), Smith (Bat) who hit the wall and came off, Davy (Norton), Keel (N.U.T.), and Fenner (Blackburne) who foot-slogged, while other failures reported are those of Hall (O.K.), Applebee (Moto-sacoche), and Brownsort (A.C.).

Incidents of the Run.

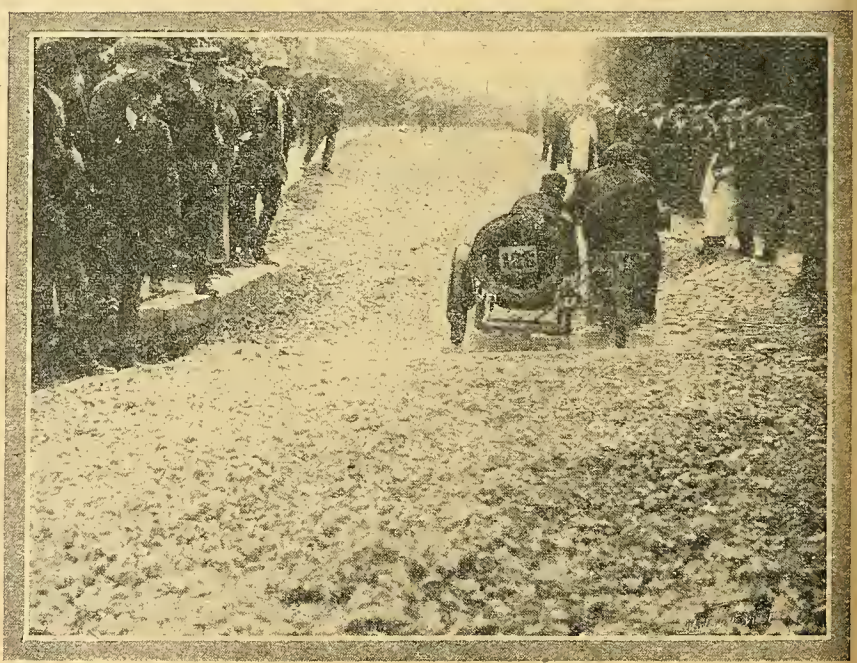
Only eighty-three finished the day's journey. May (A.J.S.) retired shortly after lunch for reasons already stated. Flint (Dayton) broke a front fork stay and had to retire. Fenner (Blackburne) came to a standstill over a gulley through the flywheel and footrests touching the ground. Ellis (Morgan) decided not to restart as he had had enough; Morgan withdrew his runabout owing to a bent front axle; the Victor cycle car, which had done so well, was delayed too long to continue, owing to a burst radiator.

The Rev. E. P. Greenhill, one of the stewards, was anxious to follow Thursday's run on a motor cycle, and a 3½ Rover was placed at his disposal by Jack Haslam. The machine carried him through in a highly satisfactory manner.

All told there were no fewer than thirty-eight hills with single figure gradients in this day of days. Any one of them would have stopped a motor cycle a year or two ago. Cook's Study near Austonley proved no test after what have gone before—indeed, several did not even have recourse to their lowest gears.

Platt (Bradbury sc.) punctured and then followed a real T.T. to make up time. We had the benefit of his dust for some time, so we know how fast his twin Bradbury is. Lodge Lane was the final climb of the day, but practically all got up easily—indeed, many scurried up as they were behind time.

W. C. Drake (3½ h.p. P. and M.) ascending Jacob's Ladder.



Eric Williams (6 h.p. A.J.S. sidecar) on Lee Lane, Shibden Dale, Thursday's *piece de resistance*

FRIDAY'S ROUTE: 148¼ Miles. Sheffield, Marsden, Littleborough, Todmorden, Hebden Bridge, Halifax (lunch), Slaithwaite, Holmfirth, Penistone, Stocksbridge, Sheffield.

It was a very reduced field that started on the last day's run of the ever-to-be-remembered "Six Days" of 1914, for, instead of the 132 who originally started, there were but eighty-one left this morning. Teeton (James sidecar) had withdrawn owing to physical unfitness to continue, though he observed the others on one or two hills. In the initial non-stop section there were several hills to climb, that leading up to Bradfield rising rather abruptly. Henfrey (Ariel), who had put in useful work at the start securing the belt pulley to the spokes, broke a belt. Later, we overhauled C. R. Collier, who was bewailing his luck with tyres, for a front wheel puncture had completed the round of all wheels. The new Matchless detachable wheel, however, soon saw him on his way again. Hereabouts also we encountered Catt, who had suffered gear trouble on his Triumph, and was obliged to withdraw, though up to that point he had not lost a single mark. Near Langsett there was a patch of unrolled loose metal which caused the riders some anxiety. Long after the others had passed Allday (James) was seen making up lost time, another puncture having delayed him considerably. Dixon, another James rider, and Edwards (Bat) managed to come into collision whilst negotiating a hairpin bend together.

Ewden is a fine climb with fair surface, steep at the bottom and with several turns. The view from the top was exceptionally fine, and it was hard to believe one was near the manufacturing districts. Practically all the survivors came up in good form. It was interesting to note that the front wheels of Armstrong's Gordon cycle car, which last night had the tops leaning inwards, had been straightened—a smart repair having been accomplished in garage in ten minutes—by fixing angle pieces and a tie rod under the axle. The last seen of Finch was near the luncheon stop, a broken exhaust valve causing a halt, when it was discovered that by no manner of means could the valve cap be removed. Haslam wasted ten minutes helping with a huge wrench, but with no avail, and finally a new cylinder had to be procured to enable Finch to proceed home. A driver who had put up such an excellent performance surely did not deserve such an ignominious exit, for the hill-climbing of his 3½ h.p. sidecar outfit has been one of the features of the trial.

Observations on Mytholm Rise.

Undoubtedly the *pièce de résistance* in Friday's run was the ascent known as Mytholm Rise, near Todmorden. At the outset the surface was of fairly good cobbles, but suddenly these were left and ordinary road metal in very bad condition was encountered. There were many acute bends, a short, easy stretch, and a long, steep section getting looser and looser towards the summit, and a final hairpin. The gradient was 1 in 5·6, and so severe was the hill that we endeavour as far as possible to qualify each performance which we noted. Francis (Lea-Francis), Little (Premier), Boxer (Bat), Platt (Bradbury), Baker (Scott), Pearson (Clyno two-stroke), and Nokes (Sunbeam), all showed up well. C. R. Collier (Matchless sc.) was apparently using too high a gear and stopped near the last bend. Hall (O.K.-Junior) dismounted and ran. Brownsort (A.C.) suffered trouble through his petrol failing to reach the carburetter, and came to a standstill, so he blew down the filler cap on the dashboard, with the result that the spirit rushed out of the tank into his mouth and nearly choked him. He tasted petrol the rest of the day. Turvey (Triumph) was baulked by a cart, and had a narrow escape from being driven into the gutter. Platt (Bradbury) made a magnificent climb, and as far as the eye could judge his was the best performance of a sidecar combination. Ball (Douglas) made a fine ascent and was applauded by the spectators, while a good climb was made by Kirk (Ariel). Price (Bat) had a tremendous struggle to get to the top—first he almost got into the gutter, then the front wheel leaped a foot off the ground, then he got into the gutter again, but cleverly saved himself and made a clean ascent.

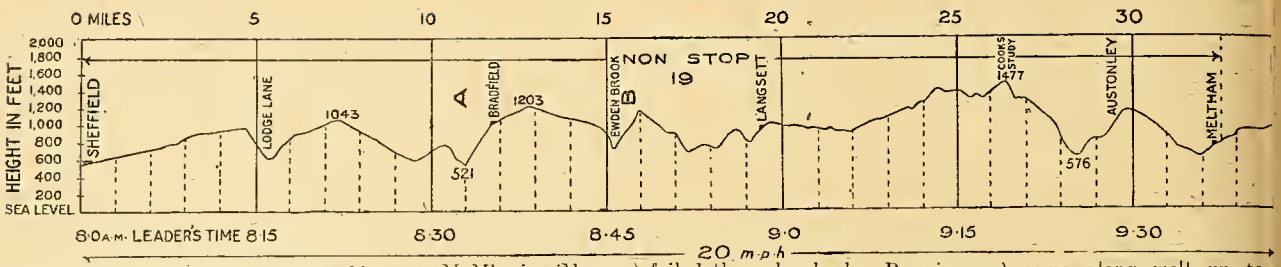
Gibb (Douglas) came up in fine form, while de la Hay (Sunbeam) did equally well. Lea (Lea-Francis) was all over the road, but reached the summit without a stop; Edwards (Bat) was driven into the side of the road by a cart, Brown (Rover) made a fine showing, while quite the best solo performance was that of Lovegrove (Scott), whose machine climbed fast and held the road in a manner which words fail to describe. Ross (Triumph), Oliphant (Premier), Clark (James), and Greaves (Enfield sc.) all got

COMPETITORS ON TROOPER'S LANE, HALIFAX, DURING THURSDAY AFTERNOON'S RUN.

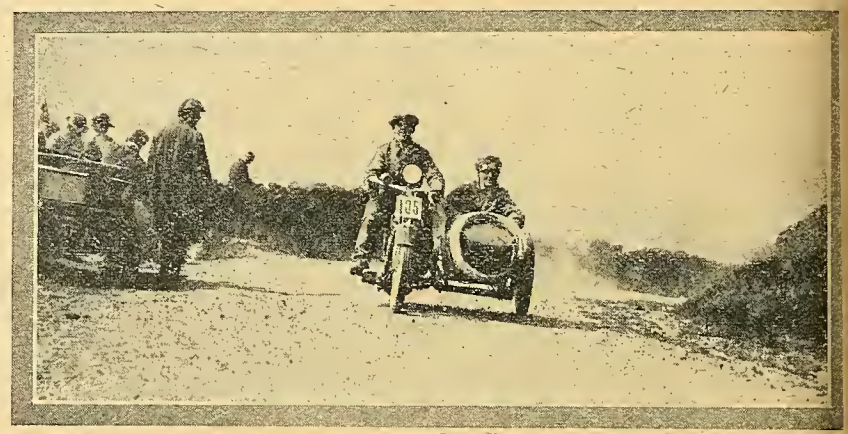
P. Phillips (Douglas) is seen leading A. Clayton (Triumph) and F. W. Applebee (Motosacoche).

H. J. Beal (L.M.C.) and G. Barnard (Sunbeam) on one of the abrupt corners on Trooper's Lane, Halifax.

FRIDAY MORNING



up well, though Egginton's Enfield sc. suffered from wheel slip, while Slater's J.B.S. cycle car made a fine climb. Drew (Imperial) was obviously failing, when he retarded the spark by turning the contact breaker between his fingers, but this feat did not save him. Bees (L.M.C.) came up with ease, while Moffat, like the other Douglas riders, made a fine ascent. Davy, whose Norton has a Brampton variable gear as well as a hub gear, went very well, Newey (Ariel) travelled fast on second, his machine leaping like a deer, and he only changed to first just below the last hairpin. Tippett (Humber) made a good ascent, while Edmond, riding a similar machine but air-cooled, failed. Smith (Bat) and Fenner (Blackburne) performed most creditably, but Keel (N.U.T.) failed to negotiate the gradient; Cook (A.S.L.), whose twin has been doing well, made a clean ascent, and Underhill (Overseas), though his engine was knocking, got up. Gray (Sunbeam) reached the top, though his engine was pre-igniting, and he slipped his clutch a good deal. Leslie (Scott) mounted the hill easily, but not quite so well as his colleague Lovegrove. Drake (P. and M.) was one of the unfortunates, but Holroyd (Blackburne) and the Calthorpe and Gordon cycle cars did extremely well. McMinnies (Morgan) failed through wheel slip, though he made a gallant effort to save himself by making the machine swerve about so as to find a place for the back wheel to grip. Guest, who has accounted for every hill on his Matchless sidecar, was in difficulties in the loose surface, but managed to pull through by bumping on the saddle. Haslam (3½ Premier sc.) came along well up to certain point, but he had to dismount f a few yards. Clean ascents were mac by Allday (James) and Hunt (Campio sc.). At the end of the climb a no



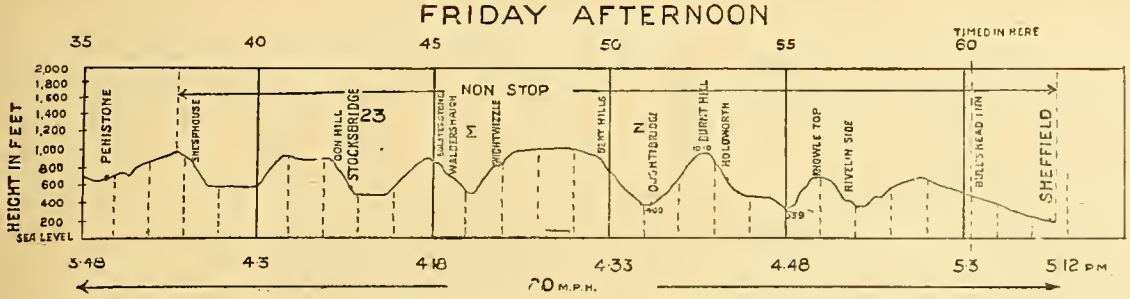
H. Greaves, on the 8 h.p. Enfield, at the top of Lower Bradfield Hill

competing Bradbury sidecar arrived a the summit with three adults and a bab on board.

At the luncheon interval Moffa (Douglas), who is well in the runnin for the 350 c.c. cup, found a tyre fla and had to repair in a non-stop section which lost him five marks. Greave (Enfield) and James (Morgan) were i the same boat..

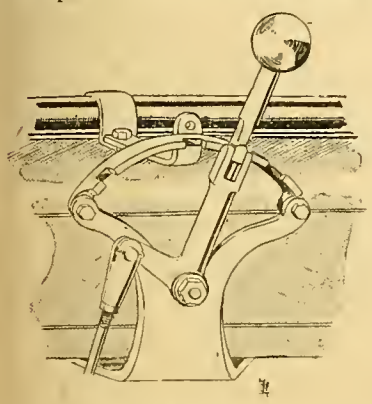
Another hill which called for a certai amount of attention was that leading ou of Holmfirth. The steepest portion wa at the foot, and was about 1 in 5; th surface was cobbles, which, someway up gave way to good macadam, and ther were two easy bends. The leaders cam up with ease, but Langton (Ariel sc.) shec a chain after leaving the cobbles, whicl cost him about five minutes' delay Frank Smith (Clyno sc.) came up well and calmly slowed right down on 1 in 5 to allow a photographer to take a pictur of him. The said photographer climbec the hill in a sidecar outfit, and turnec sharp left up a side turning with th object of leaving the machine out of th way of the competitors, when Not (Clyno sc.), who was behind, followec him. Quickly realising his mistake Not turned round on the sidecar wheel an got away again without stopping eithe road wheel or engine. It was a very clever piece of driving. Near thi point Scott was obliged to retire owing t a melted big end bearing His A.C. hac shown up particularly well throughou the week, and it was indeed hard lines t have to withdraw on the very last day o this strenuous trip.

G. Nott (5-6 h.p. Clyno sidecar) and A. J. Stevens (6 h.p. A.J.S. sidecar) on Meal Hill, Slaithwaite.



Tinker's Monument.

As stated in our report of Thursday's run, the real hill up to Tinker's monument was omitted, but even if that were so a very good substitute was found. It began by being rough, but not very steep, and keeping up its roughness for quite a distance, then the road was grass-grown and good, but the last section that mattered, which was about 1 in 6 and 3in. deep in little stones, large stones, and dust, was by no means pleasant. Drew (Imperial) failed, and Platt (Bradbury sc.) came to a stop through his gear operating rod being out of adjustment. Beyond this point a number of competitors went astray, and never passed the timekeeper at the end of the non-stop



The Wolf three-speed gear control lever.

section, but it takes a wily customer to deceive Mr. Ebblewhite, and he quickly got his car under way, and, cutting across country, took the times in a different place. The trouble was due to Thursday's arrows not having been taken down.

Further on Platt's Bradbury engine seized, and as we passed clouds of smoke were issuing from the engine, as paraffin was soused over it in the driver's frantic endeavours to finish. The last ascent of note was Burnt Hill, Oughtibridge, and we could not help but observe the more pleasant look on the competitors' faces as the end hove in sight. Wilkins (Levis) and Walters (P. and M.), who have led the string all the week, came along practically dead to time, and most of the others made good climbs. Pilkington (Rex-Jap sc.) actually stopped on a hill for the first time owing to an air lock, but proved the qualities of his machine by restarting on the steepest part and accelerating finely. The veteran Applebee got on to loose stones at the corner, and only just recovered himself. Easily the best ascent among the passenger machines was made by Burgess on the Calthorpe Minor, who swept up the hill, scattering stones in all directions at the corner. Clayton pointed to a flat rear tyre as he passed us; he rode the last twenty-five miles on the rim. Two of the three Scotts actually went up on top gear. When but fifteen miles from the finish Vickers Edwards broke a valve, and, having no spare, gave up.

Hardee's sidecar frame broke when almost in sight of the storage depot, a $\frac{7}{8}$in. solid bar of chrome vanadium steel having sheered.

Saturday's Proceedings.

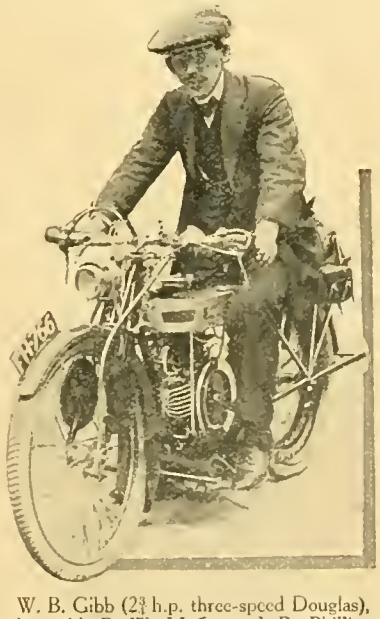
Saturday was devoted to an inspection of the machines which survived operations commencing at 8 a.m. Many a competitor whose footrests were bent, or a valve lifter broken, or rim dented, quaked at the prospect of having marks deducted which might preclude them from an award. In the evening the results were issued and the following special awards:

W. J. Brownsort (10 A.C. cycle car) climbing Bradfield Hill.

THE SPECIAL AWARDS.

The Team Prize.—The Douglas Team: Messrs. W. B. Gibb, P. W. Moffat and P. Phillips on $2\frac{3}{4}$ h.p. three-speed model Douglas motor cycles, 60.9 × 60 mm. bore and stroke. The highest and lowest of the three gear ratios available were 5.6 and 13.5 to 1. The Douglas team gained 597 marks out of a possible 600.

Second.—The P. and M. team, 593.
Third.—The Matchless team, 583.
Fourth.—The Scott team, 576.
Fifth.—The Humber team, 545.
Sixth.—The Premier team, 499.



W. B. Gibb ($2\frac{3}{4}$ h.p. three-speed Douglas), who with P. W. Moffat and P. Phillips formed the winning team in the A.C.U. Trials.

Cup, Value £8 8s. (presented by Mr. J. Haslam, Sheffield, for the best performance by any machine not exceeding 350 c.c.)—Messrs. W. B. Gibb ($2\frac{3}{4}$ h.p. Douglas) and P. W. Moffat ($2\frac{3}{4}$ h.p. Douglas) tied.

Cup, Value £15 15s. (presented by the Sheffield Motor Cycle Traders for the best performance by a sidecar machine).—R. C. Davis (8 h.p. Chater-Lea sc.).

Cup, Value £15 15s. (presented by the Sheffield Motor Cycle Traders for the best performance by a solo motor cycle).—W. Westwood (4 h.p. Triumph).

Special Gold Medal (for an exceptional performance).—N. Hall (2 h.p. O.K.), 58 × 72 mm. = 190 c.c.. Albion three-speed gear.

TABLE OF RESULTS SHOWING AWARDS AND MARKS GAINED.

Rider and Machine.	Consumption of Cycle Cars	Total Marks Gained.	Condition Marks Lost.	Bonus.	Award.

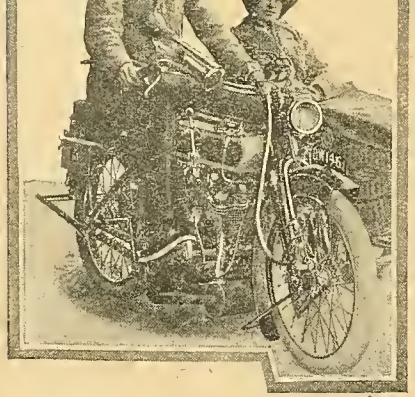
TRIALS NOTES.

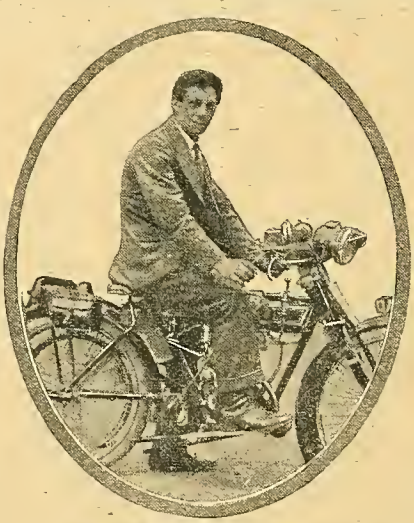
Fancy including a brake test on the level when competitors were descending 1 in 4 gradients every day without exception!

F. C. North's record in Six Days Trials is surely unequalled. He has competed in six events and on every occasion has qualified for a gold medal—a magnificent testimony to his riding skill and the qualities of his Ariel.

The Motor Cycle representatives were frequently the only pressmen observing the performances on the test hills.



R. C. Davis (8 h.p. Chater-Lea), who won the special sidecar cup in the A.C.U. Six Days Trials.



Neville Hall (2 h.p. O.K.), who was given a special gold medal for an exceptional performance. Hall's three-speed mount had an engine of only 193 c.c., and was easily the smallest to survive the course.

To W. James belongs the credit of surviving the Scottish Trial and again the English Trial on a two-seater Morgan.

The performance of Neville Hall on the 2 h.p. O.K. Junior stands out prominently. His was the only miniature to finish, and the other competitors were so impressed by his plucky exhibition that a petition was signed to present Hall with a special gold medal. His machine had an Albion three-speed counter-shaft gear.

Thursday's route was by far the worst ever arranged in a Six Days event.

One of the best roadside repairs during the trial was by J. S. Holroyd, who broke three pinions in the hub gear on his Blackburne, and effected a replacement after dismantling the gear on the road. Holroyd had never seen the inside of a hub gear before, and told us that when he removed the end plate "a lot of springs and balls fell out."

Surely there is no need for the A.C.U. to organise a "Colonial" trial now, for there are no worse roads to be found in Yorkshire than those traversed on Monday, Thursday, and Friday.

Benzole was procurable everywhere in the districts at 1s. 6d. per gallon. Those who used it liked it, and were pleased to find that their engines refused to knock.

W. Westwood (4 h.p. three-speed Triumph), who has been awarded the cup for the best solo performance.

Six Days Trials Notes.—

The two motor bicycles used by our staff in reporting this event were a strange contrast. One was the product of that old-established and excellent firm, Messrs. Phelon and Moore, was expected to acquit itself well, and it did so, while the other was one of the new 3½ h.p. twin A.B.C.'s —quite a new and untried production. Had it not done well we should have forgiven it on account of its youth, but as it climbed every test hill it was put at in excellent form and finished in perfect condition, it deserves the fullest credit.

The series of steep hills came as a surprise, and no one can recollect a trial in which there was a greater succession. It has been a tremendous test, and only the best men and the best machines have finished it successfully.

Route-marking by means of spilling dye on the roads is in its infancy. Nine times out of ten during last week's trial it was successful, but on the tenth occasion the colour would not show up on the road. The arrows are a valuable adjunct to the system, and some improvement might be effected by using brighter shades of dye.

A smoking concert arranged by the Sheffield and Hallamshire M.C.C. at the King's Head Hotel on Wednesday proved a popular change in the evening's programme. Filling up protest forms was largely indulged in other evenings.

On Thursday evening a competitors' "protest" meeting was held at the Grand Hotel, when certain resolutions were passed calling upon the A.C.U. to reduce the average speeds, especially for passenger machines. Simultaneously the A.C.U. officials were discussing the advisability of allowing a few minutes' grace in connection with Thursday morning's route, which was eventually done.

The Brake Test.

Owing to a certain amount of misunderstanding on the part of the competitors of the brake test, the marks lost therein have not been taken into consideration in making the awards.

AMONG THE CHIMNEY TOPS

P. Phillips (Douglas) and A. Pilkington (Rex-Jap sidecar) ascending Don Hill, Stocksbridge
The sidecar is seen approaching one of the several gulleys.

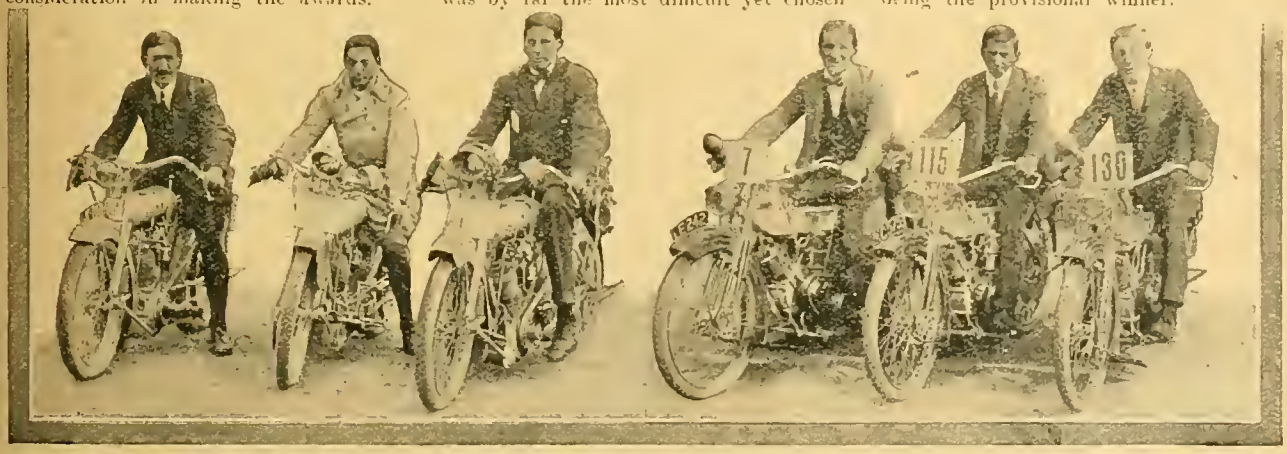
The Final Examination.

The judges, Major D. F. Nicholl, R.A., D.S.O., and Dr. A. M. Low, D.Sc., A.C.G.I., etc., and the stewards, the Rev. E. P. Greenhill and Mr. F. Dover, and other officials worked for twelve hours in examining the surviving machines and working out the results. The examination by the four gentlemen named, who are expert motor cyclists, was most thorough. We spent some time with them during their arduous task, and saw that very little escaped their notice.

EAST MIDLAND CENTRE TEAM TRIAL.

The course chosen for this trial on Saturday last was a sporting one which competitors took in a sporting spirit. It was by far the most difficult yet chosen by the Centre, being up and down test hills and along "colonial" road sections nearly the whole of the circular route, which started at Ambergate. Ten teams from the Lincoln, North Derbyshire, Matlock, and Nottingham clubs turned out, and no club other than the North Derbyshire finished with more than one man in a team. North Derbyshire were declared the winners, and now hold with Lincoln one share in the trophy. The following made non-stop runs: R. Blanksby (7 Indian), K. W. Hamilton (2¾ Douglas), C. C. Elborne (4 Triumph), T. Boam (3½ Bradbury), and B. Rhodes (3½ Sunbeam). Of these Blanksby is not eligible for an award, as his engine was over the capacity allowed for solo mounts, and Hamilton because his machine was not fitted with a clutch.

In conjunction with the Centre trial the Nottingham Club ran for the Bowden Cup, C. C. Elborne (4 Triumph) being the provisional winner.

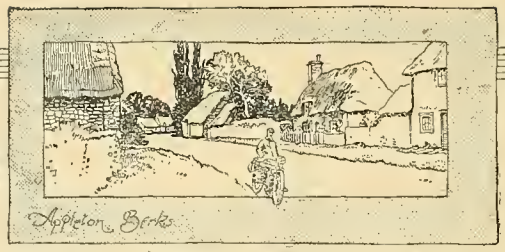


SOME OF THE SURVIVORS IN THE A.C.U. TRIALS.

THE BAT TEAM.—R. C. Boxer, Graham Price, and H. F. Edwards.

E. V. Walters, P. Shaw, and W. C. Drake, who successfully rode 3½ h.p. P. and M. machines, and were placed second.

CURRENT CHAT



TIMES TO LIGHT LAMPS.

July	16	... ...	9.8 p.m.
,,	18	... ...	9.6 p.m.
,,	20	... ...	9.4 p.m.
,,	22	... ...	9.2 p.m.

Six Days Awards.

In the present issue we give a list of medal winners in the Six Days Trials. Of these, fifty-one won gold medals, nine won silver medals, and eight won bronze, while five competitors gained no award, though they finished the course.

Half-day Trial for Cycle Cars.

There are two dozen entries for the Midland Light Car Club's cycle car and light car trial on Saturday next, the 18th inst., starting from the Midland Wheel Club's premises at 2.30 p.m.

Weights in the Six Days Trial.

It is interesting to notice the extremes met with in the official weights of the competing machines in the Six Days Trial. The lightest motor cycle was the 1½ h.p. Dayton, ridden by W. G. Ayling, which scaled 148 lb. ready for the road. The heaviest solo machine was the 5 h.p. Montgomery, which turned the scale at 324 lb. fully equipped. The distinction of having the heaviest sidecar outfit was shared by R. E. Guest (7 h.p. Matchless) and Eli Clark (8 h.p. Leader) at 616 lb. each. The lightest and heaviest cycle cars were respectively W. G. McMinnies's 8 h.p. Morgan single-seater, 588 lb., and M. D. Graham's 10 h.p. Morris-Oxford, 1,444 lb. It is interesting also to note that the average weight of the three Douglas machines which composed the winning team was 203 lb., or just 2 lb. heavier than the average weight of the machines in the Junior T.T. race.

The International Six Days Trial.

Entries for this event closed at ordinary fees on Saturday last, and the English contingent, so far as we can gather, for up to the present no official news has reached us from the U.M.F., will consist of the following: Frank Smith (Clyno sc.), a two-stroke Clyno, *C. R. Collier* (Matchless sc.), F. May (A.J.S.), *W. F. Newsome* (Triumph), *T. C. de la Hay* (Sunbeam), H. V. Colver (Matchless), P. S. Brady (Douglas), G. A. Gregson (Bat), R. C. Boxer (Bat), H. F. Edwards (Bat), F. Dover (Premier), J. Stuart White (Bradbury), J. Woodhouse (Quadrant), C. P. Finn (Enfield), M. C. Breeze (B.S.A.), a P. and M., an Ariel, two A.B.C.'s, and a Morgan in the cycle car class. Twenty-one in all, so England will be well represented. The names printed in *italics* are those comprising the British team. Entries close at double fees on July 25th. The machines will be examined and sealed on Sunday, August 2nd, at l'Ancien Arsenal, Avenue Félix Viallet, Grenoble. Teams from Germany and Switzerland, and, of course, France, will lend an international air to the competition. In all, over sixty entries are expected.

Show Stands.

At the Olympia Show in November certain stands will be available for firms desirous of supporting the system of universal stand decoration. The idea is the outcome of an effort toward uniform stand decoration at the Olympia Show of 1915.

SPECIAL FEATURES.

A.C.U. SIX DAYS TRIALS.

MILITARY MOTOR CYCLISTS.

ROAD TESTS OF NEW MODELS.

Two-strokes and Lightweights.

Among the special articles arranged for our next issue is a description of a hill-climbing expedition in Lakeland by Mr. George D. Abraham.

Miss May Walker will deal with lightweights and two-strokes from a lady's point of view.

"Why I Favoured the Two-stroke Engine" is the title of an interesting article by Mr. Alfred A. Scott.

This number, dated July 23rd, will be specially enlarged.

A.C.U. SIX DAYS TRIALS. R. E. Guest (7 h.p. Matchless sidecar) in one of the gullies on Lee Hill, Shibden Dale, where many stopped. This ascent was covered with large loose stones.

FUTURE EVENTS.

July 18.—M.C.C. Members Meeting at Brooklands.
„ 18.—Midland Light Car Club Open Efficiency Trial.
„ 18.—Liverpool Amateur M.C.C. Open Trial for Amateurs only, for Reliance Cup.
„ 25.—Streatham and District M.C.C. Open Hill-climb.
„ 25.—Coventry and Warwickshire M.C. Cycle Car and Light Car Open Trial.
„ 25.—B.M.C.R.C. Race Meeting.
Aug. 3-9.—F.I.C.M. INTERNATIONAL SIX DAYS TRIALS. Grenoble as a centre.
„ 15.—Essex M.C. Race Meeting at Brooklands.
Sept 6-9.—ANGLO-DUTCH TRIAL IN HOLLAND.

International Six Days Trial.

Further probable entrants for the trial at Grenoble organised by the F.I.C.M. include G. Hunt (8 h.p. Campion sc.) with new Jardine four-speed gear box, and A. E. Catt (4 h.p. Triumph).

Motor Cycle Races at Cambridge

There will be three races for miniature motor cycles (not exceeding 250 c.c.) at the Cambridge Town and County Mammoth Show which will be held on the August Bank Holiday. Entries to Mr. W. C. Gibbs, 9, Christ's Lane, Cambridge, close on the 26th inst.

The Castleford Speed Trial.

On Wednesday, last week, the Castleford Motor Club held a successful speed trial at Byram Park, in which the following proved to be winners in their respective classes: Lightweights—G. Shaw (2¾ Nestor). Sidecar machines up to 3½ h.p—M. H. Watson (3½ P. and M. sc.). Sidecar machines over 6 h.p.—C. Lynn (8 Matchless sc.) and — Pailey (6 New Hudson sc. (tied). All comers' handicap—E. Roberts (2¾ Douglas). The fastest time of the day was made by G Shaw (3 Enfield) over a half-mile course, from a standing start.

A.A. and M.U. Notes.

Special Road Warnings.—The A.A. has been informed by the District Council of Cheadle and Gatley that a large number of motor vehicles are passing through Cheadle at unreasonable speed. As there is a great amount of traffic in the High Street, the council feel that unless greater care is taken, prosecutions may ensue.

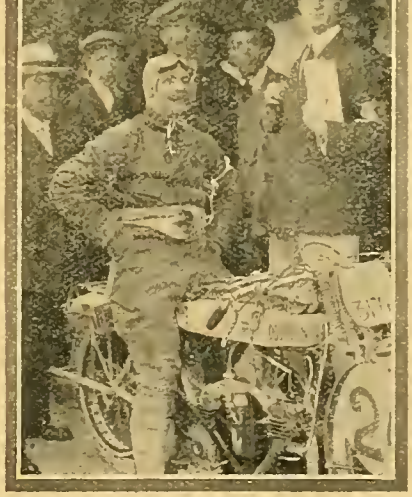
The Perth-Inverness road is again open to traffic, a temporary bridge having been erected at Carr Bridge, in place of the bridge lately washed away. Members are warned that careful driving will be necessary in this neighbourhood for some time to come.

West of England Road Notes.—Several A.A. members have recently sent in letters complaining of the unsatisfactory condition of roads in the County of Devon. The Association has for some time past been endeavouring to secure the necessary improvements, and is now informed that, as a result of an application to the Road Board, a large grant is being made for the purpose of extensive operations in the county.

R. W. Lovegrove (3¾ h.p. Scott) ascending Trooper's Lane, Halifax, in the A.C.U. trials. The Scotts excelled in hill-climbing this year

An Italian Race.

Classes for 350 c.c. and 500 c.c. machines were provided in the Circuito Valle Ticino, an important Italian road race held last week. In the former a Douglas machine ridden by B. Badino finished first over the 127 miles, and in the 500 c.c. class honours went to Bordino, riding a Motosacoche, Rudges filling second and third positions.



Baj Badino (2¾ h.p. Douglas), winner of the 350 c.c. class in the Italian race, the Circuito Valle Ticino, run last week over a 127 miles course

Next Thursday!

An issue devoted mainly to two-stroke and lightweight motor cycles. A number of special articles and illustrations will be included.

No Professionals Eligible.

"Amateurs only" is the keynote of the open reliability trial for the Reliance Trophy and other prizes to be held by the Liverpool Amateur M.C.C. on July 18th. The trial takes the form of a 130 miles run.

Drive Carefully in Harrogate.

The Corporation of Harrogate, a town which has lately seen a good deal of motor competitions, recently decided to apply for a ten-mile speed limit in consequence of numerous complaints of reckless driving in the town. Motorists visiting this place are requested to drive with moderation, especially along the Leeds road and West Park. Although steps have been taken with regard to the provision of signposts at certain dangerous corners, the Harrogate and District A.C. feel sure that if a little more consideration is shown by motorists it will help to prevent the infliction of one more speed limit area.

Circuit de l'Eure Team Prize.

Considerable uncertainty appears to have existed over the winning of the team prize, for which the Hutchinson Tyre Co. put up a trophy in the Circuit de l'Eure. First of all it was announced that the Douglas team had won, and this was followed by a further examination of the timekeeper's records, whereupon it was stated that the B.S.A. team were entitled to the award. The matter, we understand, has now been finally settled at a meeting of the Sporting Committee of the Motor Cycle Union of France, held last week, when it was definitely decided that the originally named team, viz., the Douglas, were the winners of the trophy.

Invitation Team Trial in Yorkshire.

An account of this severe trial was published in our issue of June 11th, but the final and official result did not come to hand until this week, and is given below:

1. Harrogate.—W. Fawcett (3½ P. and M.), T. C. Atkinson (2½ Triumph), R. Swift (4 Bradbury), G. Hill (3¾ Scott), W. E Grange (6 Bradbury sc.), and H. W. Fortune (6 A.J.S. sc.).

2. Bradford.—T. Bullus (3½ P. and M.), S. Todd (3½ P. and M.), P. Shaw (3½ P. and M.), H. Drake (3½ P. and M.), W. Gillyard (8 Chater-Lea sc.), and W. Clough (8 Chater-Lea sc.).

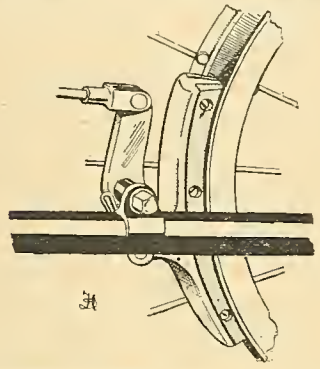
No other club finished with a full team. The special medal presented by the President of the Bradford Club for the best individual performance of the day goes to W. Fawcett (3½ P. and M.).

South Harting Hill Climb

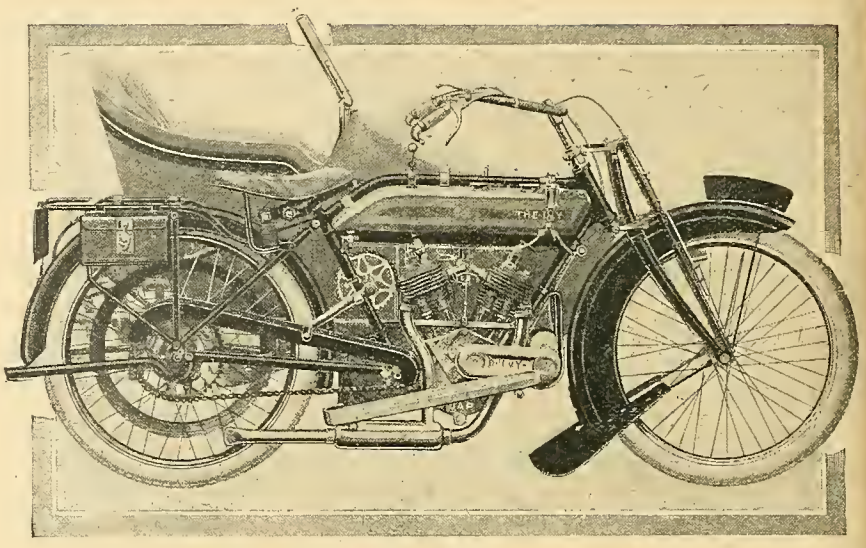
A fine entry of sixty-one has been received by the Cyclecar Club for their hill-climb on Saturday next at South Harting, which starts at 2 p.m., but is preceded by a lunch at the Dolphin Hotel, Petersfield. A special class is reserved for lady drivers, and has attracted five entries. A feature of the proceedings will be the free decarbonisation of competitors' engines, if desired, by the Dyer Apparatus Co., Willesden.

A New 5 h.p. Ivy Model.

IN addition to the wide range of machines manufactured by S. A. Newman, of Aston Cross, Birmingham, a very practically designed 5 h.p. twin will in future be marketed. The engine is the 70×85 mm. twin J.A.P., and the drive to the rear wheel is by chain throughout, the Enfield gear being fitted. The front chain is neatly enclosed in a metal case, and the rear chain is protected by a cover extending over the top links. An Amac carburetter is fitted, and the magneto may be arranged for handle-bar or tank control. One of the most striking features of the machine is the mud-guarding. The front wheel is covered by a wide guard with deep continuous valances, and, in addition to these, a large magneto shield helps to protect the rider's feet. The rear guard is 7in. across the chord, and catches the mud thrown from the brake rim as well as from the tyre. The equipment is thoroughly good throughout, and the powerful rear brake (which is fitted to most Ivy models) is worthy of comment.



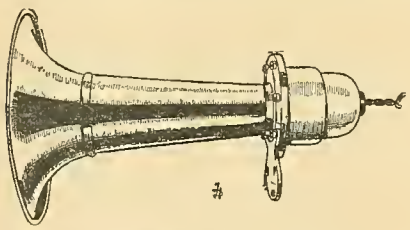
Powerful rear brake on the 5 h.p. Ivy.



Valve side of the twin-cylinder Ivy sidecar combination.

A NEAT ELECTRIC HORN.

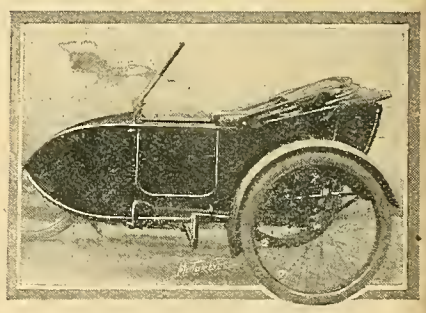
Electric horns have a great fascination for the majority of motor cyclists, though sometimes a fear of extra complication exists. The Apollo manufacturing Co., of Moseley Street, Birmingham, has just produced a very simple and effective device, which has the additional advantage of requiring very little current. Half an amp. only is required, so that the usual small 4½ volt "Flash" dry battery will last over a very considerable period. In point of fact, a somewhat earlier type of horn has been in use on a light car owned by one of our staff. The machine has been in constant use since the beginning of March, and the original twenty-amp. cells are still in use. There has probably been a certain amount of waste due to meddlesome folk in garages, so that it might be a good plan for those who have no lock-up to fit an intercepter in the circuit, when the batteries should last indefinitely. The construction of the device is remarkably simple, and there is practically nothing to go wrong, even the trembler adjustment being adjustable by the merest novice. In simple words, the action of the horn is as follows: A diaphragm of special steel is carried in a specially formed horn base and from it projects a steel rod. Surrounding the rod is a circular electro magnet, which actuates a vibrating armature with the usual platinum screw adjustment. At each vibration the armature hits the diaphragm rod, and a clear penetrating note is produced. Besides the screw adjustment the armature, which is mounted on a special carrier, can be easily moved nearer or further from the end of the rod if required. A neat button switch is provided, and the horn is well finished in plating, brass, or black. It may be obtained with handle-bar fittings or for light cars.



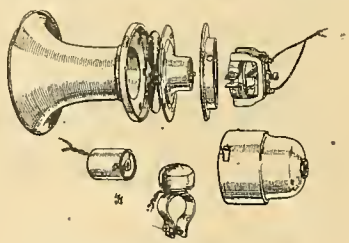
The Apollo light car horn.

THE EARLE SIDECARS.

A light and durable sidecar with ample seating accommodation and space for tools, luggage, etc., is to be found in the Earle, which is manufactured by Messrs. John Lester and Co., 62, Highgate Road, N.W. Much care is put into the design and construction of bodies, which comprise the necessary artistic streamlines that are so essential if a really smart and neat effect is to be attained. Customers are also able to have their own ideas put into execution in a satisfactory manner. We called recently and inspected several bodies, some in the finished state and others in the course of erection. Aluminium mouldings are used, but only with care, for it is quite an easy matter to spoil the appearance by over-decorating in this respect. Another point which commands attention is the efficient toolbox provided at the rear of the seat, access to which is possible without disturbing the passenger. Further notable features, such as spring back and seat, map pocket, mat, a large toolbox underneath the seat, locker in front of body, lamp bracket and apron, and patent quick attachment are also provided.



The Earle coach-built sidecar with wind-screen and Cape cart hood.



The A.M.C. motor cycle electric horn showing details of construction.

"THE MOTOR CYCLE" LIST OF CLUB EVENTS.

July 18th.—Bradford M.C. and L.C.C. Hill-climb.
" 18th.—Dublin and District M.C.C. Reliability trial and speed-judging competition, leaving Rockbrook P.O. at 2.30 p.m.
" 18th.—Bury and West Suffolk and Ipswich M.C.C Inter-club event.
" 18th.—Middlesbrough and District M.C.C. Sidecar trial for McAdams Cup.
" 18th.—Cyclecar Club. Hill-climb at South Harting and run to Selsey.
" 18th.—South Cliff (Scarborough) M.C.C. Flexibility hill-climb.
" 18th.—Bolton and District M.C.C. Speed contest
July 18th.—East Essex M.C.C. Gymkhana.
" 20th.—Plymouth and District M.C.C. Open-air general meeting at Rock, Yelverton, at 8 p.m.
" 22nd.—Middlesbrough and District M.C.C. Slow race from Bungalow.
" 22nd.—Folkestone and District M.C.C. Paperchase, starting at 2.30 p.m.
" 23rd.—Leicester and District M.C.C. Run to Rockingham Castle, starting at 2.15 p.m.

Western District (London) M.C.

This club is being entirely reorganised, and all those wishing to join, especially motor cyclists residing in the Ealing district, should write the hon. sec., Mr. B. F. G. Fowke, 10, St. Stephen's Gardens, East Twickenham, for particulars.

Newcastle and District M.C.

A route-finding competition has been held over a fifteen mile course. Out of fifteen starters ten completed the course, and W. E. Crompton (2¾ Sunbeam) proved to be the winner.

Purley and District M.C.C.

A competition was held last Saturday for the Dobson Cup, which was won in a point-to-point trial by H. J. Densham (6 A.J.S. sc.), with J. W. Cumming (7 Matchless sc.) second, and H. B. Willoughby (3½ Rudge) third.

Grimsby and District M.C. and L.C.C.

The result of the hill-climb at Thorganby Hill was as follows:

Class 350.—1, C. H. Jennison (2¾ Douglas), fig. of merit 96.
Class 600.—1, H. S. Jennison (Campion), fig. of merit 124; 2, Withers (Rudge multi), 129.9; 3, Bellamy (Triumph), 130.6.
Class 1,000.—1, Rostern (4-5 Zenith), fig. of merit 124; 2, Lambert (4-5 Zenith), 141.
Sidecar.—1, Roots (6 Campion), fig. of merit 119; 2, Sleight (4½ Singer)

Colchester and District M.C.C

A hill-climb was held on the 4th inst. at Bounstead Hill, Berechurch. *The Motor Cycle* formula was used. Results:

Touring Machines to 500 c.c. (on Time).—1, E. C. Thorn (3½ Singer), 28⅕s. 2, J. G. Bromley (3½ Rover), 28⅘s.
Any Machine to 1,000 c.c. (on Formula).—1, T. S. Wilkin (3½ Rudge), 108; 2, R. L. Armes (2¾ Douglas), 126. On Time.—1, F. E. Crosby (7 Indian), 24⅕s. 2, B. Hines (7 Indian), 25⅕s.
Sidecars (on Formula).—1, J. G. Bromley (3½ Rover), 118; 2, P. G. Page (7 Indian), 215.
Any Machine to 500 c.c. (on Formula).—1, T. S. Wilkin (3½ Rudge), 96; 2, F. E. Crosby (2¾ Douglas), 106.
Flexibility Trial.—1, J. G. Bromley (3½ Rover), slow 59s., fast 18s. (ratio 3.28); 2, T. S. Wilkin (3½ Rudge), slow 45s., fast 16s. (ratio 2.82).

Blackheath and District M.C.

A successful flexibility contest was held on the 4th inst. on Crown Ash Hill. Competitors were required to cover a certain portion of the hill as fast as possible during the afternoon, and later another portion of the hill as slowly as possible. The results were based on the formula $\frac{W \times T_2}{C \times T_1}$ where W = weight of machine and rider, C = cubical capacity of engine, T_2 = time of slow climb, and T_1 = time of fast climb. Results:

Solo Class (Time).—1, G. S. Woodman (7-9 Indian), 17⅗s.; 2, G. Edwards, jun. (7-9 Indian), 20⅗s.; 3, E. Lister Wilson (7-9 Indian), 20⅘s.
Solo Class (Formula).—1, W. L. Strong (3½ Rudge Multi), fig. of merit .0447; 2, G. S. Woodman (7-9 Indian), .0391; 3, G. Edwards, jun. (7-9 Indian), .0326.
Passenger Class (Formula).—1, G. W. Poynton (7 Matchless sc.), fig. of merit .0724; 2, C. T. Liddon (15-18 Hupmobile), .0546; 3, L. Hewitt (6 Enfield sc.), .0306.

Dorset A.C.

A hill-climb was held at Zigzag Hill, Shaftesbury, on the 8th inst. Results: 1, E. W. Benison (2¾ Douglas); 2, R. Rogers (2¾ Douglas); 3, H. Springfield (2¾ Douglas).

The second event resulted in V. Hunt (6 Sunbeam) and T. F. Rowland (2¾ Douglas) tying for first place.

Fastest time of the day was made by L. Adams, whose 2¾ Diamond covered the 1,584 yards in 1m. 55s.

Slough M.C. and L.C.C.

The result of the recent Stratford-on-Avon (second) trial for the Harris challenge cup is as follows: 1, Mr. Swinstead (V.S. sc.), time 10m. 22s.; 2, Mr. Eliot (Arno), 19m. 15s.; 3, Mr. Kennedy (Douglas), 27m 4s.

Portsmouth and District M.C.

The above club held its annual speed-judging contest at Rowlands Castle on Wednesday, July 1st. The winners were L. Shilling (8 h.p. Morgan), 30 secs. early; C. Bennett (Sparkbrook), 55 secs. early; and W. J. Fleetwood (Henderson), 100 secs. early.

Club News.—

North Birmingham A.C.

The results of the club hill-climb, held on the 4th inst. at Hipton Hill, Evesham, are as follow:

CLASS I.: Solo.—1, A. G. Forsythe (3½ Regal) fig. of merit 410; 2, T. Hubbard (3½ B.S.A.), 510; 3, Ernest Smith (3½ Regal-Green), 540. Fastest time of the day, A. G. Forsythe (3½ Regal), 17⅘s.

CLASS II.; Sidecars and Cycle Cars.—1, Ernest Smith (3½ Regal-Green), fig. of merit 627; 2, Arthur Butterfield (2½ Levis), 809; 3, T. Hubbard (3½ B.S.A.), 940.

The event was decided on *The Motor Cycle* formula.

Bradford M.C. and L.C.C.

A reliability trial was held last week to Landsides and back *viâ* Haworth, Colne, Gisburn, Clitheroe, Trough of Boland, Lancaster, and Milnthorpe. Result: 1, W. Clough (8 Chater-Lea sc.); 2, C. Sydney (3¾ Scott); 3, E. Bennett (3½ B.S.A.); 4, S. Binns (3¾ Scott). Teams of three riders from other clubs are invited to take part in the Bradford-Brighton and back (August 1st-4th) run to compete for the Dyson Shield.

Bristol B. and M.C.

The third reliability trial was held over a ninety-five mile course to Marlborough and back on the 11th inst. A fair number of members competed, and all accomplished the double journey in spite of the fact that the course was not arrowed, and was difficult to follow: Result: 1, A. S. Richards (2¾ A.J.S.); 2, W. B. Harris (6 A.J.S.).

The club's annual members' trial to Land's End is fixed for August 1st to 3rd.

North-West London M.C.C.

The eighth annual gymkhana took place on Thursday, the 9th inst., at Finchley, before a most appreciative gathering of about 2,000 people.

The events were of this club's usual order, the details being, however, of distinctly novel character. About twenty competitors took part.

A.C.U. SIX DAYS TRIALS.

W. D. Hawkes (10 h.p. Victor cycle car) on the lower portion of Scapegoat Hill during Thursday morning's run.

A.A. SCOUTS UP-TO-DATE.

The A.A. Scouts in Cheshire and various other districts have now been supplied with Auto Wheel attachments by the A.A., to enable them to cover a bigger field.

FORTHCOMING OPEN EVENTS.

M.C.C. Race Meeting at Brooklands.

The Motor Cycling Club will hold a private race meeting at Brooklands on the 18th inst. There will be eleven races for motor cycles, sidecars, and cycle cars (in addition to two for cars), the most important of which will be the club championship for the "Harry Smith" gold challenge cup. Distance, ten laps.

Penrith and District M.C.C.

By permission of the Earl of Lonsdale, president of the above club, open speed trials will be held in Lowther Park on Bank Holiday, August 3rd, at 10.30 a.m. In all there will be fifteen events, including special events for two-stroke motor cycles and cycle cars. The awards consist of gold, silver, and bronze medals, and a special prize for the fastest time of the day. Entries, to the secretary, the Gloucester Arms, Penrith, close on July 25th.

Open Trial in the South.

The West Hants M.C.C. have applied to the A.C.U. for a permit for an open reliability trial to be held on August 8th. There will be five classes for solo machines, three for sidecars, and one for cycle cars. Competitors will be timed by their own watches in sealed cases. There will be four non-stop sections (short). The start will be from the White Hart Hotel, Ringwood, Hants, at 8 a.m., and the distance about 160 miles. Entries should be sent to the hon. secretary, Mr. Chas. H. R. Norrington, Longham, Wimborne.

One Day Open Trial.—Manchester to Brooklands.

The N.W.A.A. will run an open one-day trial under A.C.U. open permit, on Saturday, August 1st, from Manchester to Brooklands.

The first portion will take the nature of a reliability trial (length, two hundred miles). The route will be Manchester, Buxton, Ashbourne, Atherstone, Daventry, Banbury, Windsor, Henley, Staines, Weybridge, Brooklands.

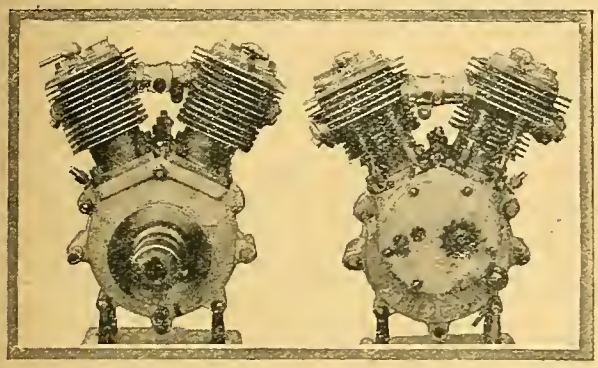
Over this first portion certain lengths will be of an absolute non-stop nature, but the total non-stop lengths added together will not exceed seventy-five miles, leaving the balance—125 miles—for competitors to go as they please.

On arrival at Brooklands track, all competitors will be timed over a flying lap (two and threequarter miles). After finishing the lap they will ascend the test hill from a standing start, where their times will again be taken.

For rules and regulations, apply to the hon. secretary Mr. S. W. Carty, 5, Redcross Street, Liverpool.

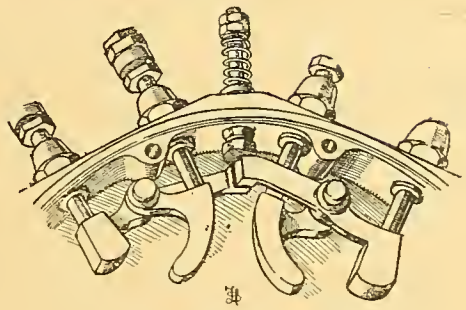
The 4 h.p. Twin Precision.

THE 4 h.p. twin Precision is described by the makers as a lightweight twin, as it is claimed that, on account of its flexibility and smooth running, it does not require a heavy frame or fittings, while the weight of the engine itself is only 57 lb. It is, of course, not to be imagined that a machine fitted with this engine should be a lightweight proper, but that it should be very light for the power. The design follows standard Precision lines, but there are several interesting features peculiar to the engine. The bore and stroke are 60 and 88 mm. A new inlet pipe is



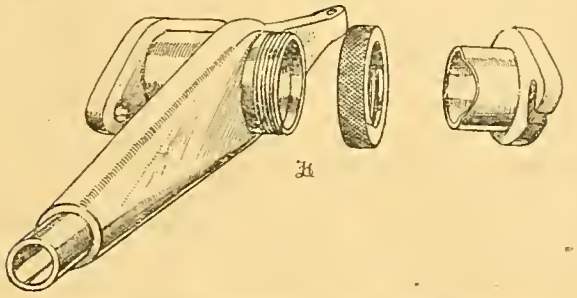
Both sides of the latest pattern 4 h.p. twin-cylinder Precision engine.

fitted which will be standardised on all Precision twins, and the manufacturers are to be congratulated on taking so much interest in a much neglected part. The pipe is somewhat flattened to permit of an easy passage between the valve chests, and flange joints are utilised to make a sound connection. To prevent air leaks in the pipe the flanges are bolted up tight to the cylinder, and a sliding joint is formed by two separate parts of the pipe, while in addition a light stuffing gland is formed by a screwed ring packed with special material. The internal exhaust lifter is another note-



The neat exhaust lifter mechanism on the Precision engine.

worthy point, for a spring tappet projects upwards from the top of the timing case, while the lower end rests upon extension arms of the exhaust valve rockers. Thus, on depressing the tappet by means of the usual handle-bar control, both exhaust valves are lifted evenly, a point which helps easy starting and renders the valve gear quieter when coasting down hill. Two cams only are used, one for both valves on each cylinder.



Inlet pipe on the new 4 h.p. twin Precision.

An All-enclosing Body.

Novel Construction which excludes Grit and Wet from Moving Parts.

ON many cycle cars the transmission is left unprotected from the ravages of road dust. But to produce a vehicle with separate devices of protection for various components means that inaccessibility will reign. Therefore it was in considering these items that Mr. Percival White, Kelvin Road, Highbury, resolved to design and construct a machine the body of which would enclose as much of the mechanism as possible. Streamline principles are strictly adhered to, whilst the weight is not at all excessive, in spite of the substantial form adopted. Two seats are provided which can be readily detached if necessary, whilst for inspection of the transmission, and for making minor adjustments thereto, the backs, which are on hinges, can be moved forward, thus allowing a certain amount of freedom in gaining access.

In this particular model chain transmission is utilised, but in all probability some other forms will be tested in order to find out which will be the most suitable. A 9 h.p. 90° twin J.A.P. provides the power.

Mr. White, having studied the question of cycle cars for some years both in America and England, knows how important it is to have as efficient a type of springing as possible. At the same time, he is not a believer in very light springs of large amplitude, as under these conditions such a vehicle will not hold the road with certainty. Consequently, the suspension has been designed carefully, and, as we found out in a trial run, is very effective in practice. Furthermore, the steadiness on corners is very noteworthy, in spite of the long wheelbase. Each rear spring is made up of two separate cantilevers, which house the wheel bearings at one end and are slotted at the forward end in order that adjustment for the chain can be carried out. When on the road we were delighted with the steering, which is of the wire and drum type.

We think that such a vehicle with its wood frame and a simple form of transmission could be made very reliable as well as to sell at a reasonable price.

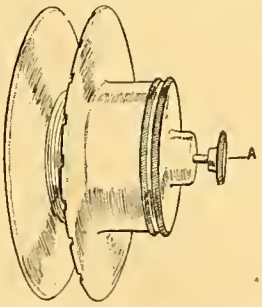
Fafnir Motor Cycle Engines.

FAFNIR engines are manufactured by the Aix-la-Chapelle Steel Works, a long-established firm which is known throughout the whole Continent for the quality of the material employed in the various branches of engineering with which it deals. The Fafnir firm is one of the oldest connected with the construction of motor cycle engines, and has been in the business over fourteen years. The address of the London branch is 211, Upper Thames Street, E.C.

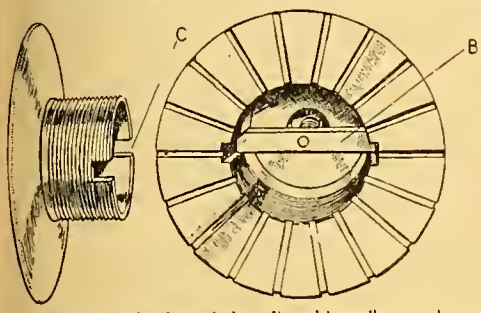
A variety of models is manufactured—the 2½ h.p., 70×80 mm., ball bearing crankshaft, and the popular 3½ h.p., 499 c.c., 85×88 mm. The engine, which weighs about 54 lb., is beautifully made, and is provided with a gear-driven magneto The mainshaft is provided with a double row of Skefko self-aligning ball bearings, and an internal exhaust valve lifter is adopted. The valve rockers are fitted with roller ends, thus minimising the friction to as large an extent as possible, and the tappet bearings run in long bushes. The distance pieces below the valve guides are drilled at the sides, so as to keep the springs from contact with the cylinder,



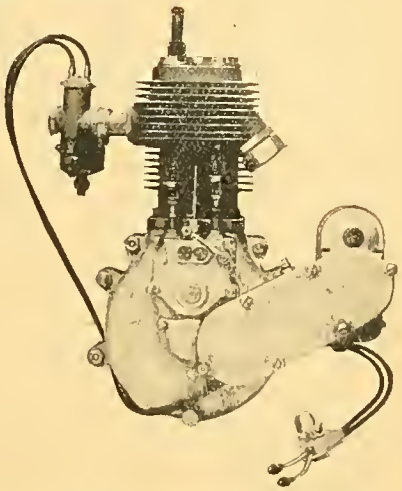
The complete Fafnir adjustable pulley.

thus keeping them cool and adding to their life, while in the latest models adjustable tappets are fitted. Great care has been taken with the design of the engine, oil holes being provided in all bearings to ensure perfect lubrication. The latest models of this engine will be provided with a chain-driven magneto.

The Fafnir adjustable pulley is quite an interesting piece of work The method of operating is clearly shown in the accompanying illustration. The knob A is attached to a spindle holding the bar B, and when pulled out allows the pulley to be turned till, on the knob being released, it again engages with the slot C. The pulley therefore can



Interior mechanism of the adjustable pulley on the Fafnir engine.



Valve side of the 3½ h.p. Fafnir engine.

be operated and the gear ratio raised or lowered without the aid of tools, a point which should be much appreciated by the average rider.

The illustration of the Fafnir method of holding the gudgeon pin is also interesting. It will be noted that two rings only are fitted to the piston, and that the gudgeon pin is slightly tapered, and has a slot cut in its narrow end. A spring ring is fitted into a slot in the piston itself, and on the gudgeon pin being driven through the ring springs into the slot and holds the gudgeon securely.

To most of these models the Fafnir two-speed epicyclic gear box can be

Method of securing the gudgeon pin on the 3½ h.p. Fafnir engine

fitted. It is designed to bolt straight on to the crank case, and is driven by means of three pinion wheels direct from the crankshaft to the belt pulley, which runs at half the engine speed.

Besides the 3½ h.p., the Fafnir Co. supply a 5-6 h.p., 70×80 mm. twin; a 4½ h.p., 86×96 mm. single; and a cycle car engine, 85×88 mm. twin, which can be had either water or air-cooled, and fitted with or without a leather cone clutch.

THE A.C.U. SIX DAYS TRIALS.

J. Haslam (3½ h.p. Premier sidecar) on the rough surface of Lee Hill, Shibden Dale

STREATHAM OPEN CLIMB

The Streatham and District M.C.C. will hold their fifth annual open hill-climb on the 25th inst. at 3 p.m. During the afternoon there will be twenty classes, including cycle cars, and in the standard bicycle classes a weight limit will be imposed as has been done before by this club. *The Motor Cycle* formula will be used. Entries must be received by the hon. trials sec., Mr. Frank L. Bassett, 73, St. Julians Farm Road, West Norwood, S.E., not later than the 18th inst.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Thunderstorms.

Sir,—I think that your correspondent "X 37" is in error in thinking that the partial insulation afforded by india-rubber tyres is any protection whatever against lightning; in fact, this insulation may, in certain cases, actually increase the danger of the "disruptive discharge" known as the lightning stroke. Perfect metallic connection between the wheels of the vehicle and the earth, such as obtains in the case of railway trains, is much more likely to form an efficient protection. F.W.H.

A Gap in the Market.

Sir,—In reply to Mr. Edmund Caseby's letter in the last issue of *The Motor Cycle*, has this gentleman, I wonder, tried the capabilities of the 2½ h.p. Motosacoche machine?

Considering this motor cycle possesses practically all the requirements Mr. Caseby describes in his letter, and that the Motosacoche is a native of Geneva, Switzerland, I should fancy it is just such a machine that his dozen *confrères* could wish for. I have ridden one or two of this make of motor cycle, and have been perfectly satisfied with its handiness, hill-climbing capabilities, and low cost of upkeep.

R. L. NYE

Colwyn Bay Races.

Sir,—With reference to the protest lodged against Mr. Wade's engine in Class I., this engine has now been measured by Mr. Loughborough, of the Auto Cycle Union, and he has certified that the size of the engine is 69.99 bore by 71.20 stroke, making the c.c. 273.73. In fairness to Mr. Wade, it should be stated that he filled up his entry form in ignorance of the size of the engine, putting down the sizes as 70 × 76, which, on the face of it, places his engine outside this class, thus proving that he was perfectly innocent in his intentions.

Mr. Wade has been perfectly honourable over the whole matter, and the engine which I took from him at the races has never been out of my hands until measured by Mr. Loughborough. The result is that now the first prizes in Classes I. and XIV. are being awarded to Mr. Wade on his 2½ h.p. New Imperial.

S. W. CARTY,
Hon. Sec. Mersey M.C.

Proposed Trial for Lady Motor Cyclists

Sir,—I have been trying for some time to get up a test for ladies only. It seems hard that all trials should be got up for men, and there are at present so many good lady riders.

Mrs. Gordon Fletcher has kindly consented to help me and also to ride, so I hope with this able assistance that the event will be a great success.

Will any lady who is keen send her name in to me as soon as possible? The closing date for entries will be August 6th. A silver cup has been offered as first prize, and there will be a second and a third prize.

A stiff reliability trial has been suggested, about 120 miles non-stop run (lunch excepted), over very hilly country with plenty of hairpin bends. I am sure lady riders will agree that a difficult test will be more interesting than an easy one. It will be interesting to see, I hope, some good driving, steady heads and good nerves.

I hope the entries will be many and that all lady riders will help to make the event a sporting success.

(MRS.) E. KNOCKER.

[Letters addressed c/o the Editor will be duly forwarded.—ED.]

Scottish Six Days Trials.

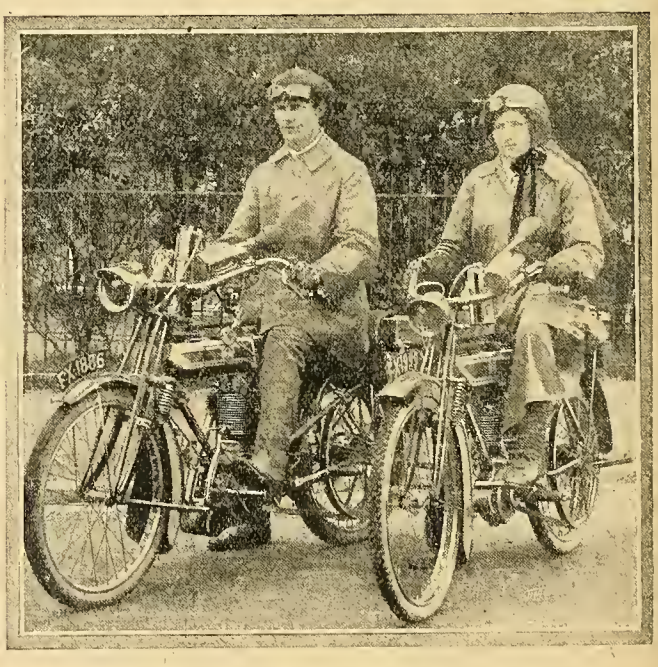
Sir,—I have noticed with considerable interest the remarks of your correspondent with reference to the marking in the Scottish Six Days Trials, and beg heartily to endorse them. It is, in my opinion, ridiculous and distinctly unfair to have deprived the three competitors mentioned of gold medals through being the matter of a minute or two early or late at a check, and this calculated, in the majority of cases, by means of watches which were never intended for the purpose, viz., were not proper stop watches. The reply of the officials to this is probably that competitors are allowed five minutes early or late at checks, but unless special watches are employed it is almost impossible to determine to a second when the five minutes has expired. Take the case of the Lea-Francis rider, who arrived within a few yards of the finishing point with a clean sheet and through no fault of his own or his machine checked in a few minutes late. The right and proper course of the officials was to award this man the gold medal he earned. FAIRPLAY.

[We give our correspondent's letter publicity, but we do not know that the watches employed were unsuitable for their purpose. We should imagine that they were suitable. Rules are rules, and if a small latitude is allowed to one competitor why not to all?—ED.]

Lady Motor Cyclists.

Sir,—Being a constant reader of *The Motor Cycle* and seeing the growing number of photographs of lady motor cyclists, I think perhaps the enclosed photograph of Mrs. Clarke and myself would be of interest to your readers.

Mrs. Clarke rides a 2½ three-speed Premier, and has now ridden some 2,000 miles, and my mount is a 3½ h.p. of the same make. ERNEST L. CLARKE.



Mr. and Mrs. Clarke on their Premier motor bicycles

Loose Carburetters.

Sir,—I have so frequently read complaints in the correspondence columns of *The Motor Cycle* as to the difficulty experienced by customers in trying to induce manufacturers to fit other than standard carburetters, that the following experience is quite a welcome relief. At the end of January last I took delivery of my 1914 3½ h.p. twin-cylinder N.S.U. fitted with the standard N.S.U. carburetter. I had covered some 2,500 miles very satisfactorily, but thinking to get a little more speed and power I brought the machine up to the N.S.U. works at Willesden Green, and, on explaining my wants, the people there tested the machine and fitted a Senspray carburetter, involving the fitting of a complete new induction pipe and petrol pipe, free of all charge, telling me to test the machine at my convenience, and, if I liked the Senspray, then to keep it, or, if not, to bring the machine back and they would replace my old carburetter. I might mention that I am very pleased with the Senspray, which has more than fulfilled my expectations. Usual disclaimer all round. O. B. SMYTH.

An Australian Rider's Suggestions.

Sir,—Seeing several letters in your valuable paper recently anent all black finish, might I be allowed a few words, not being in favour of such a procedure? I opine that with an all black machine, when such is on view in a showroom window, well polished up, there is no doubt that it looks very pretty; but let it be run for fifty miles on a dusty road in company with a machine finished in grey colour, and note the difference in appearance—the dust colour scores every time.

When my machine—which is a 3½ h.p. twin M.A.G. (the "Speedwell" on the tank is the trade mark of the agents here)—first reached me, it had a black finish with nickel fittings, but I soon tired of frequently spending hours

F. Hoff on his 3½ h.p. Speedwell-M.A.G.

cleaning it, so got it re-enamelled a colour between that adopted by the Matchless people and a slate grey, having the hubs, spokes, rims, and many out-of-the-way clips done, but the handle-bars I left nickelled, as I do not think it improves a machine to have them coloured, and is unnecessary, as they are easy to keep bright. I now can spend half an hour cleaning and looking after the engine and vital parts, whilst the time spent on dusting over the other parts is infinitesimal.

I enclose a photograph of myself, taken recently, which may be of interest. Most of the riders here have semi-T.T. bars, and dispense with footboards, and also use knee-pads on the tank, as these three items give one a feeling of being at one with one's mount, which is very necessary on account of the wretched state of our roads here. Another fact worth mentioning is the light weight of the frames which are often sent out. They may be all right for your land, but our roads need to be ridden on to be appreciated (!) Why, in the heart of the city they are dangerous to life and limb. F. HOFF.

Sydney, N.S.W.

The Overseas Trial.

Sir,—If this event is intended to be anything of a test of overseas models, the following conditions ought to be imposed:

1. The trial should be held over a course of not less than 150 miles in length, which must be covered without a refill of petrol or oil. This will test tank capacity. (The average tank accommodation is quite inadequate for Australian conditions.)
2. The roads selected should be the roughest in England. Marks to be deducted for dented rims, broken spokes and fork springs, and fractured frames.
3. No tyre pump, tools, or spares of any kind to be carried by competitors or obtained *en route*.
4. Schedule speed to be 20 m.p.h. All hills shall be in non-stop sections—section to commence at least one mile from foot of hill.
5. At finish of course machines must cover a half-mile stretch at 50 m.p.h.
6. A record of petrol consumed to be made and mileage per gallon shown in the results.
7. Marks to be allotted to all machines fitted with spring frames.

If the first four conditions are not included the A.C.U. might as well save itself the trouble of conducting the trial.

Melbourne. DISSATISFIED.

A Starting Difficulty.

Sir,—I think a little of my experience with motor cycles may interest readers of your paper. First, I had a locally-built machine, but as the frame kept breaking (twelve times) and the expense of repairs (£30 in eleven months) was too much, I sold it. Then I got a German machine, which went well but was slow, and I was often about a mile behind the rest of the club. Then I got a Triumph (1909), a good and fast machine, but as I was leaving the State for a time I decided to sell it. I found a likely buyer and went out for a run with him. Now my machine was noted for the easy way in which it started, but, strange to say, after going over the hills with him I was going to show him how easily it started, but try as I would, I could not get one stroke out of it. There was another motor cyclist with us of ten years' experience—mine is five years and the buyer's two years—but not one of us could find the fault. We got a good shock at plug and a good spark, but we tried four plugs, carburetter was clean, timing right, etc., so my friend offered to tow me home. Now I do not like to be beaten in anything like that, so all the way home I was thinking, and in my opinion there was only one thing that could be wrong, namely, the magneto; so I said to the buyer, "Come home with me, and I will show you in five minutes what is wrong," so he came, and I took the magneto off and cleaned the oil off the carbon inside the one running on to the armature on 1909 Bosch machines, and away it went; I was getting a spark, but not under compression.

Victoria, Australia. AMATEUR.

The Rule of the Road.

Sir,—Allow me to protest against a practice which is becoming very common among motor cyclists and cycle carists. I refer to a certain class of road users who *habitually* corner on the wrong side. I myself have seen the same riders do this time after time. Some do it just for "swank," others do it to avoid "changing down," and again some do it in pure ignorance or thoughtlessness.

I have seen the same person repeatedly move right over to the other side of the road, in order to "hog" up an oncoming hill on "top." It is not even safe to be on one's right side when these people are about. Twice recently this practice has been forcibly brought to my notice, and on one of these occasions I had to hug the kerbstone so closely to avoid a collision that my silencer actually scraped it.

I refer more especially, but by no means exclusively, to sidecarists. I know that a gentle right hand bend can be negotiated more easily at speed by nearly scraping the right hand kerbstone, but is the game really worth the candle? I do hope that readers of this letter who are guilty of this offence will just think for a few minutes of the danger they are causing to themselves and others. With a little thought, I feel sure that people would realise the foolishness of their doings and would leave off endangering other people's lives.

THOMAS B. CROW.

Black Lists and Boycotting.

Sir,—One reads a great deal about "black lists" on which towns where the speed limit is enforced are placed. Now, as a keen motor cyclist, I must admit that I do not agree with such methods.

I think that there should be a reasonable speed limit through every town, or else many motor cyclists would rush through at all speeds, as is evident by the number of fines. As to the vigilance of the police, what is the law made for but to be enforced?

With regard to the supposed harmful effect of boycotting, I do not think that there is anything like the harm done that one is led to believe. Moreover, I think that these methods cannot tend to make motor cyclists popular among the public, as the cause of the grievance is amply justified and recognised by all but a number of inconsiderate enthusiasts. C. R. NEUZERLING.

The Lightweight Vogue.

Sir,—Your readers must have read with considerable interest and pleasure the recent announcement of an early special number of *The Motor Cycle* dealing with two-stroke and lightweight machines. These machines are introducing a great many newcomers to the ranks of motor cyclists, and this leads me to suggest that perhaps the noble army of raw recruits have reached a degree of numerical importance which would justify a special corner of *The Motor Cycle* being devoted solely to their interests every week. So numerous and varied are these new creations that the choice is bewildering, and expert guidance desirable.

The question also arises whether it is not time to differentiate "lightweights" into two classes, in order to distinguish the genuine, or ultra-lightweight, from its heavier brothers. In defining this new class it is better to err on the light side, or, speaking in terms of h.p., the limit should not exceed 2¼. This h.p. is ample for solo riding, if a change-speed gear is used. MOTORETTE.

Rear Lights.

Sir,—May I, as a motor cyclist, heartily endorse the remarks in your issue of July 2nd on this point? It is altogether typical of our imbecile party politicians that they will waste months and years over trivialities, whereas matters of life and death (and this question of rear lights on all road vehicles is no less than such a matter) are allowed to slide untouched. Is it impossible to wake up these well paid Rip Van Winkles to the fact that the world is changing with unprecendented rapidity, that every day sees the flood of motor traffic increased in volume and mobility, and that the existing regulations, though no doubt suited to the times of Boadicea, are in these days an outrageous anachronism? Then another grievance I have is against the way in which carters and the like sprawl across country roads and lanes without the slightest notion of keeping to their own side. Cannot the police be persuaded to transfer a little of their attention from motor trapping to these appallingly negligent people? It is all very well to retort that I as a motorist want the whole earth to myself. I want nothing of the sort. But the quintessential fact is that motors have come to stay and increase in numbers, and what I do want is a commonsense acceptance of this fact and the new and more stringent obligations on all road users entailed thereby, without waiting for the otherwise inevitable long list of accidents to focus attention on the point.

In the meantime we have that priceless sample of imbecile legislation, whereby motors, the fastest vehicles on the road, must carry rear lights, though the slowest, and consequently most dangerous, vehicles are seemingly allowed to do as they like in these matters.

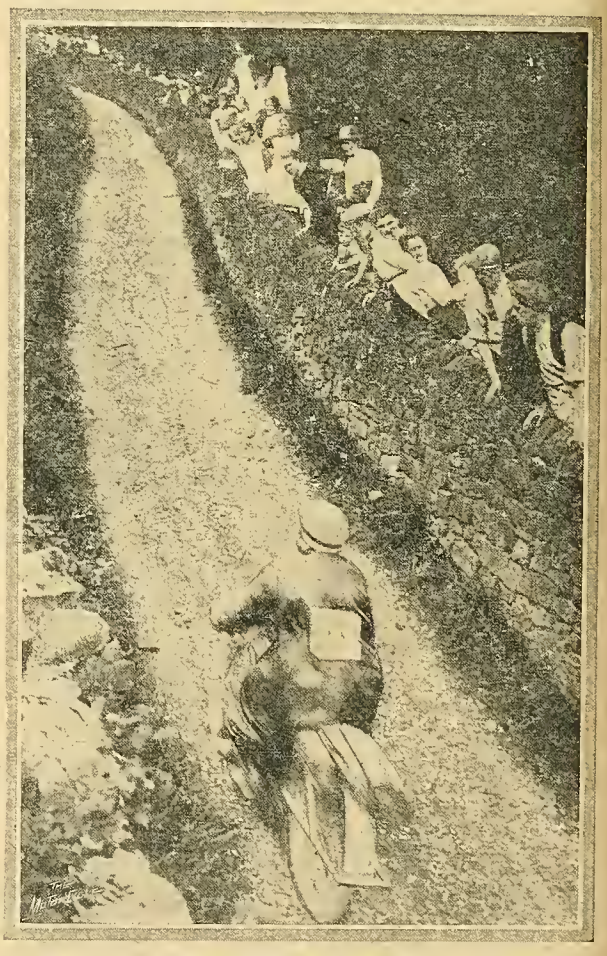
I suppose nothing short of a surgical operation will get it into the heads of members of Parliament that mere speed as such is not of itself a dangerous thing. Once this obsession is removed we may perhaps anticipate a little intelligent legislation. HUGH P. VOWLES.

Sir,—As your correspondent, Mr. A. B. Bennett, seems to know all about the accidents in which a Derby motor cyclist ran into the back of a brewer's dray, and a similar accident in which another motor cyclist ran into the back of a furniture van, perhaps he can give us some information as to what speed each of the motor cyclists was travelling. It seems to me that before using these accidents as arguments in favour of rear lighting it is very important to have some information as to the speed. If these two motor cyclists were travelling faster than either the law or the effectiveness of their head lights permitted with safety, the accidents are no doubt most regrettable, but are poor as arguments on which to base advocacy of rear lighting. W. P. COOK.

Short-sighted Policy.

Sir,—Having garaged my machine at a South Coast watering-place for eighteen months and having paid my accounts regularly every month, I have now received treatment guaranteed to cause me to withdraw any custom over which I have any influence. Having at the end of June an account of somewhere near £2, I wrote the firm a cheque for £2, asked for my bill to be sent, and my bicycle to be forwarded to Dover at once. After a week's delay I received a receipt for my £2 and a short but firm note to the effect that on receipt of the other ten shillings owing them the bicycle would be despatched by passenger. As a matter of fact, I did not forward the ten shillings, but wired to their manager at a neighbouring town, and by the next train my bicycle arrived, a week and two days adrift.

Doubtless, this seems to be a very small grievance, but to the naval man, who has to take his pleasures on the spur of the moment, and at odd places, it may, and does, cause great inconvenience to be treated in this fashion by a firm that owes its prosperity almost entirely to naval owners of cars and cycles. T.H.



B. J. Chinn (4 h.p. Wolf) ascending Jacob's Ladder, one of the worst hills in Tuesday's route of the A.C.U. trial.

For Traffic or Hills

the Brampton Variable Gear is ideal. Its advantages are best appreciated when dense traffic makes it essential to throttle down, or when long hills necessitate a lower gear. Fits practically all engines where boss does not require pulley flange of more than $\frac{7}{16}$ inch deep—and for all riders who require complete satisfaction and lasting efficiency.

GIVES SEVEN SPEEDS AND A FREE ENGINE AND MAKES A '3½' RUN LIKE A '4.'

A Wonderful Record

THE annual Scottish Six Days Trial is generally admitted to be by far the severest trial in which light cars and cycle cars take part.

The course consists of over 1,000 miles of the worst roads in Scotland, including rock-strewn mountain passes and appalling hills. The competitors have to maintain an average speed of 20 miles an hour. Such a trial tests the hill-climbing powers, the springing, and the braking efficiency of the cars to an exceptional degree.

For three consecutive years the G.W.K. has competed in this strenuous trial, and each time has obtained the highest award and put up the best performance of all cars—a wonderful record.

In 1912 the G.W.K.'s obtained a Gold and a Bronze Medal, and the Special Passenger Prize.

In 1913 the G.W.K.'s obtained 2 Gold Medals and the Special Passenger Prize, and were the only cars to complete the course without loss of marks.

In 1914 the G.W.K.'S obtained three Gold Medals, and were the only complete team of cars to finish. How's that for reliability and durability? Write now and fix up a trial run.

THE E.I.C. 02 PLUG

ABSOLUTELY OIL PROOF.

NO PLUG has ever leaped into favour in so short a time as the now famous E.I.C. type 02.

For a few weeks we offered these Plugs at a special price to enable the public to test for themselves and prove to their own satisfaction that all our claims were sound and justifiable. The appreciation has been such that the demand has been far in excess of our most sanguine anticipations. We have literally received hundreds of letters of appreciation of their quality.

Every machine in T.T. Race fitted with these Plugs went through without Plug trouble. Every Plug carries with it our guarantee.

We have the right article and intend to place it on the market at the right price. Therefore, it will now be possible for the motoring public to purchase a really high-class plug of exceptional qualities at exceptional price - - -

It stands to reason

that your motor cycle will give you greater power and longer service if fitted with two-speed gear and free engine.

Possibly you have not realised that the cost is moderate and the equipping quite simple with the Fitall Two-speed Gear. This can be easily and quickly fitted to almost any make of motor cycle without structural alteration.

It is a triumph of simplicity—*one lever* effecting every change—and costs only five guineas. Write to-day for our latest booklet. It contains some useful information.

One of the many testimonials from riders of Juno Motor Cycles.

88, Greaves Street, Little Horton, Bradford.
May 28th, 1914.

Dear Sirs—I have now run my "Juno" Two stroke for 1,000 miles, and it has proved itself so reliable that no adjustments have been made. The way it takes hills is marvellous, it is the best value for money I have come across.—W. S. Capstick.

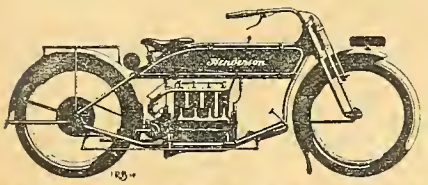
List on application. Trade enquiries welcomed.

:: IN THE :: SCOTTISH SIX DAYS TRIAL

The Henderson



ECLIPSED ALL OTHERS

THE MOTOR CYCLE

REFERRING TO ITS PERFORMANCE ON VARIOUS HILLS, SAID:—

. . . . The four-cylinder Henderson made a LOVELY CLIMB, purring silently, and steering to a hair with absolute steadiness. . . . The Henderson again did the prettiest climb of the ENTIRE ENTRY. . . . . Robertson Brown has had cruel luck with his Henderson. He lost his way on Monday, and, misunderstanding the rules, mistimed his riding schedule, and forfeited a few marks, to which, under the curious E.D.M.C.C. rules, a "first time" penalty of fifty extra marks is added. Since then he has been going great guns, and has ECLIPSED THE ENTIRE ENTRY on more than one hill. To-day he roared up Glendoe only to sustain a dry skid at a loose corner a few miles on, and crashing into a deep ditch, broke the frame.

OUR ONLY EXCUSE FOR THIS ABRUPT FINISH IS THAT AFTER FIVE DAYS OF BUCK JUMPING AND PRECIPICE CLIMBING ONE IS APT TO TREAT WITH INDIFFERENCE SUCH DETAILS AS CULVERTS, LOOSE STONES, HAIRPIN CORNERS, ETC., ETC.

WE LOST A MEDAL BUT GAINED A REPUTATION THAT CANNOT BE ASSAILED.

ROBERTSONS

REGISTERED

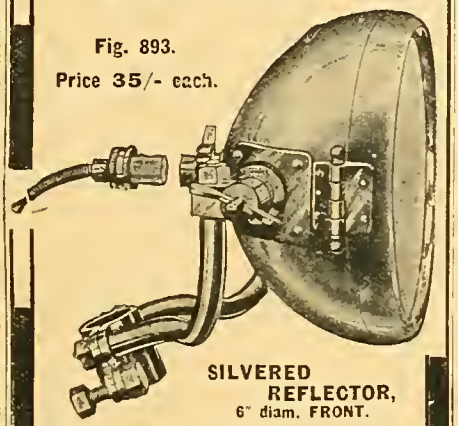
PRACTICAL HH RELIABLE

TRADE MARK

ELECTRIC HEAD LAMPS NEW MODEL.

Fig. 893.

Price 35/- each.



SILVERED REFLECTOR, 6" diam. FRONT.

This lamp is the most powerful electric head lamp obtainable. The beam is from **600 to 800 feet,** according to type of bulb fitted. Adjustable for angle of beam, and has detachable bulb holder which allows of focus adjustment, and provides an electric inspection lamp. Dustproof fronts.

Fig. 895. Similar to above, but with brackets for top of handlebars.

Price, 37/6.

HELLESEN DRY BATTERIES.

A Genuine Hellesen Battery provides the best source of current for above lamps, and when a low consumption bulb is used the life of a

Flash type battery is about 100 hours — sufficient under average circumstances for nine to twelve months' use.

Price 6/6 each.

"These Batteries are very suitable for operating electric horns. Full details sent on receipt of particulars as to type of horn."

H.H. BADGE CLIP.

MOTOR CYCLES FOR SALE.

Premier.

PREMIER Depot,

20, Holborn Viaduct, E.C.

PREMIER.—A few 1913 3½h.p. Premier fitted with counter-shaft 2-speed or hub 3-speed gears, second-hand but guaranteed by makers to be in perfect order, with or without sidecar; prices from £36; trials and terms arranged.

LIGHTWEIGHT Premier, 2½h.p. model, only a few left; list price £36, this week £27; clutch or 3-speed at extra charge. You cannot afford to miss this opportunity.

PREMIER Showrooms, 20, Holborn Viaduct. [5269

3½h.p. Premier, free engine, good running order; bargain, £18.—Blackhurst, 23, Johnson Rd., Marton, Blackpool. [X5013

WHAT Cash Offers?—1913 3½h.p. Premier, 2-speed counter-shaft, soiled, unused.—26, London Rd., Gloucester. [X4994

1914 3½h.p. 3-speed Armstrong, Premier, lamp, horn, done about 400; £47/10, bargain.—Wills, chemist, Merthyr Tydfil. [5234

PREMIER, 3½h.p., 3-speed counter-shaft; £61/10; actually in stock.—The Exeter Motor Cycle and Light Car Co., Ltd. [0508

BRAND New 1914 3½h.p. 3-speed Premier, owner dead; first cheque over £50 secures.—7, Doncaster Rd., Barnsley. [X5051

PREMIER, 1912, 3½h.p., 3 speeds and clutch, used solo only, splendid order throughout, overhauled and guaranteed; £35.—Below.

PREMIER, 1912, 3½h.p., standard touring model, Lucas lamp set, horn and tools, good condition, overhauled and guaranteed; £22.—Elce and Co., 15, Bishopsgate Av., Camomile St., E.C. [0480

1911 3½h.p. Premier, fitted with 1913 spring forks, tyres and belt good, enamel and plate good; £17. —Robinsons, Green St., Cambridge. [8622

1913 3½h.p. 2-speed Counter-shaft Premier, Corvette sidecar, fine climber, superb order; £45.—Purcells, 78, Charlotte St., Fitzroy Sq., W. [5064

1914 Premier, 3½h.p., counter-shaft model, 3-speed, new, never used; cost £61/10, accept £48/10.—Garland, Ironmonger, Warrington. (D) [X4131

1911-12 3½h.p. Premier, clutch model, very little used, condition as new, new tyres, belt, P. and H. lamp set, horn, spare belt, etc.; £24.—Earl, 5, Heath St., Hampstead. [X4940

PREMIER Twin 2¾h.p. Lightweight, late 1912, beautiful order, just overhauled, guaranteed perfect; £14, worth £20; bought cycle car.—77, Tower Ramparts, Ipswich. [X5071

1912-13 3½h.p. Premier, Sturmey-Archer 3-speed, just renewed, Palmer cord back tyre, P. and H. lamp, good condition; £34; with Montgomery sidecar £36/10, offers.—Wilkinson, 14, Crecfield Rd., Ealing. [5077

PREMIER, 1912, 3½h.p., 2-speed, Dunlop tyres front, Hutchinson on back, lamp and horn, £36/10; also another, 1912½, 3-speed, with sidecar and accessories, £42.—Lamb's, 151, High St., Walthamstow. [5190

1914 7-9h.p. Premier Combination, counter-shaft model, Canoelet sidecar, Pillion seat, elaborately fitted up, purchased February, used 1,300 miles only; cost £95/10, accept £65.—Barrett, Motors, Canterbury. [X4412

Puch.

PUCH, 5-6h.p. twin, fast, powerful, sidecar, all accessories; any examination; £38.—13, Fleetwood St., Stoke Newington. [5120

Quadrant.

QUADRANT, 3½h.p., standard, Bosch mag., B. and B. carburetter; £14.—Motor Co., Ltd., Hereford. [X4830

QUADRANT, 1912, 4¼h.p., Big Single, 3 speeds and clutch, cane sidecar, in splendid order, overhauled and guaranteed; trial; £32.—Elce and Co., 15, Bishopsgate Av., Camomile St., E.C. [0478

Rex.

REX, 1912, Big 4, new condition, £25; sidecar, £3. —67, Wantage Rd., Reading. [X4999

REX, 6h.p., chain drive model, and coachbuilt Sidette; £85.—Motor Co., Ltd., Hereford. [X4828

TWIN Rex, clutch, large family sidecar; £28.—Hole, Lissinghurst, Park Lane, Carshalton. [5327

REX and Rex-Jap, 1914 models; keen exchange quotations.—Collier's, Westgate, Halifax. [0390

REX, 6h.p., 2 speeds, belt drive, with coachbuilt Sidette; £77/10.—Motor Co., Ltd., Hereford. [X4829

3½h.p. Rex, B. and B., spring forks, running order; £7.—Windermere, Wellington Rd., Bilston, Staffs. [5275

REX, 1909, 3½h.p. model, Bosch, good tyres, nice machine; £14.—Speechley, 45, Church Rd., Acton. [5404

1909 3½h.p. Rex, with 1911 cylinder and piston, splendid condition; 10 gns.—80, Dorset St., Leicester. [X4973

Two-strokes and Lightweights.

THIS week our pages are mainly devoted to the subject of two-stroke engines and lightweight motor cycles, these two products having attained to such a degree of popularity and importance that such a step is warranted. Few people realise how closely the two-stroke engine and the lightweight motor cycle are allied, yet the one is undoubtedly the outcome of the other. The lightweight, to our mind, has not commanded so much attention lately merely because it *is* a lightweight, for everybody with the slightest experience of motor cycle matters has for years sighed for a genuine lightweight motor cycle able to perform all ordinary requirements: but, undoubtedly, it is the two-stroke engine which has mainly accounted for the wonderful latter day development of the miniature motor cycle. Long ago this journal asserted that in the two-stroke engine lay the keynote to the lightweight, and *The Motor Cycle* has consistently encouraged this type of engine by frequent articles and by keeping readers posted on developments in this direction. In the spring we strongly recommended the R.A.C. and A.C.U. to conduct a special trial for two-stroke engines, and, although our suggestion has not yet borne fruit, it is undoubtedly only a question of time before a trial exclusively confined to engines working on the two-cycle principle will become an accomplished fact.

Ten years ago a good deal of ink was spilt on the subject of featherweights (we refer to machines weighing about 80 lb.), and certain journalists were so absorbed in them that they went so far as to declare that heavyweights were dead. The editorial view of *The Motor Cycle* published at that time was that the lightweight pure and simple would take ten years to materialise in a successful guise, and this view was openly expressed on more than one occasion. At the same time we pointed out that the lightening process would be gradual, and as the efficiency of engines went up so should we be able to reduce their capacity and thus bring about the lightweight motor cycle. Our words have proved pretty near the mark, but unquestionably the two-stroke engine has given the lightweight a tremendous fillip.

There is nothing new in the lightweight; indeed, just as the cycle car was the forerunner of the modern motor car, though, of course, under a different name, so the lightweight was the forerunner of the modern motor cycle. We who used it in the early days of the movement knew only too well its shortcomings. Did we not pass our novitiate on a 1¼ h.p. Werner, afterwards migrating to a 1¾ h.p. Minerva, and thence to a 2 h.p. of the same make? There were no change-speed gears in those days of the movement, but *The Motor Cycle* lost no opportunity to point out the desirability of such a fitment, and seven or eight years ago successfully conducted a campaign in favour of the change-speed gear for motor cycles. Gradually, but surely, engine efficiency has been improved from year to year until now we have miniature engines able to propel rider and machine at speeds which satisfy the moderate-minded rider, quite apart from the useful purposes into which such machines may be pressed by doctors, travellers, and others, where extreme handiness is a *sine qua non*.

The Vogue of the Two-cycle Engine.

THE lightweight is bound to enjoy a tremendous vogue, but we doubt if this vogue will not be surpassed by the two-stroke engine. The vast possibilities of the two-stroke engine as a motive power have always been impressed upon us. Its light weight alone proves its worth, not to speak of its simplicity and absence of valves—so important when small sizes and high temperatures have to be considered. Originally the two-stroke engine was very extravagant and erratic in its running, but the best brains in the motor cycle world have been devoted to its improvement, and the time has arrived when the

two-stroke or "valveless" engine, as it is sometimes called, promises to be a serious rival to its four-stroke prototype Indeed, so far as lightweights are concerned it is questionable if the two-stroke engine does not already rule the roast, and its uses are bound to be further extended in the near future. Who knows, too, that the two-stroke engine may not some day or other solve the cycle car question?

Finally, we should like to make it clear that we are not among those who consider that the lightweight has arrived to the exclusion of every other type. It has all along been our view, and we have openly expressed it on several occasions, that no one type of machine will satisfy everybody. The old saying about one man's meat applies especially to motor cyclists. There ar those who are not content to tour along with a lo geared engine buzzing away at their feet; there ar others who by reason of their bulk and stature ma find it impossible to use a lightweight with comfort especially as 24in. wheels are so much favoured. Suc people are, however, in the minority, and the light weight is bound to attract thousands of new converts and even if its purpose in life were only to act as a stepping stone to higher circles, it would have mor than justified its existence. We look forward with con fidence to a very bright future for this type.

TWO-STROKE TIPS.

Keep the exhaust ports clear of carbon and the silencer and pipes quite free.

If power diminishes, clean the piston rings and grooves, and while the cylinder is off scrape the underside of the piston head.

Use a fairly large plug gap; the magneto runs at engine speed and will spark across a wider gap than is used on a four-stroke.

Keep the carburetter gauzes clean, and if there are gauzes in the transfer ports they require occasional cleaning and the joints should be very carefully made.

Too much trouble cannot be taken over the cylinder and port joints.

Plugs are most important, and it is well to use the plug recommended by the makers.

A big jet gives power, but does not usually two-stroke well at low speed. On the other hand, a small jet usually improves two-stroking.

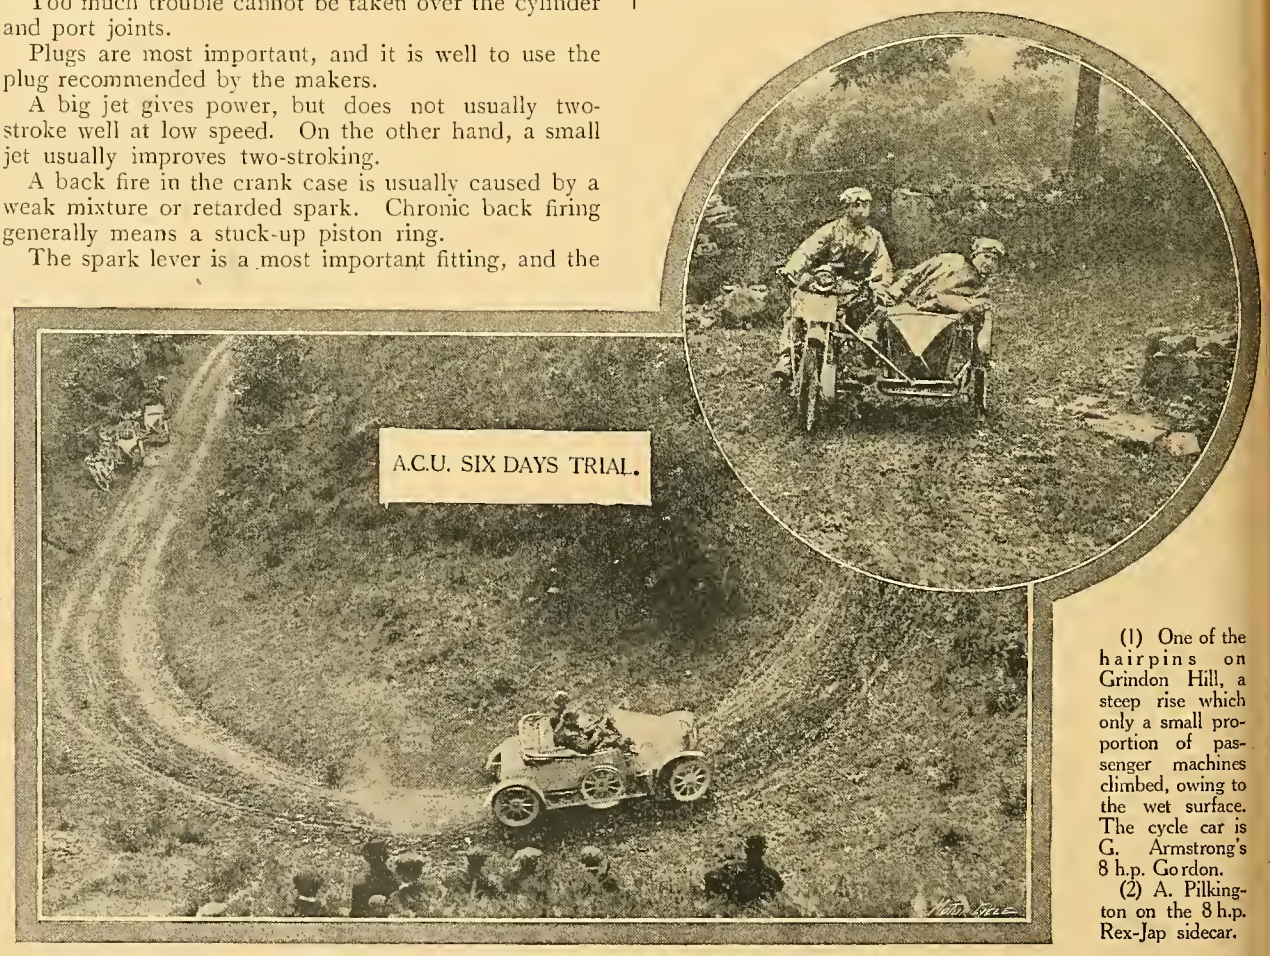
A back fire in the crank case is usually caused by a weak mixture or retarded spark. Chronic back firing generally means a stuck-up piston ring.

The spark lever is a most important fitting, and the spark position is of the greatest importance on two-strokes.

If the release valve is exposed and has no gauzes, make sure that the tank is sound and that no petrol is overflowing from the filler cap.

The spark timing should be more advanced on two-strokes than is customary with four-stroke engines.

In the case of engines lubricated by "petroil" mixture, shake the tank before attempting to start after a long rest in order thoroughly to mix the fuel, and use only the best oil.

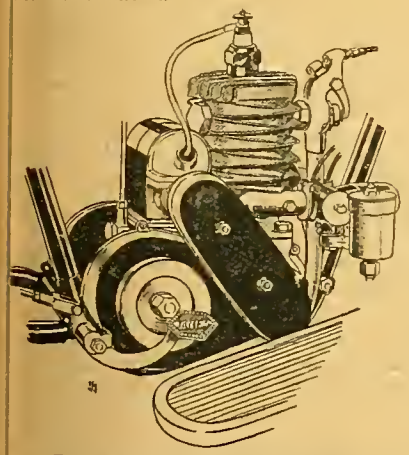


(1) One of the hairpins on Grindon Hill, a steep rise which only a small proportion of passenger machines climbed, owing to the wet surface. The cycle car is G. Armstrong's 8 h.p. Gordon.

(2) A. Pilkington on the 8 h.p. Rex-Jap sidecar.

THE A.E.C. TWO-STROKE.

AN addition to the list of two-strokes is the machine manufactured by the Auto Engineering Co., of Springfield Place, Coventry. The single-cylinder engine is of the three-port type and has a bore and stroke of 62×70 mm. The drive is by belt and chain, the two-speed Condor gear box being placed well forward so as to obtain as long a belt as possible. The main shaft of the gears passes right through the box and carries the belt pulley on the opposite side to the chain wheel, the box itself being carried on a flat slotted plate at the base of the seat tube. The engine is mounted in a somewhat unusual manner, being carried between two steel bearer plates bolted direct to the frame. This method relieves the crank case of all frame strains and also enables the engine to be detached with considerable ease. The frame has double top tubes and is fitted with Saxon forks and 24in. wheels.



Engine unit of the two-stroke James.

TWO-STROKE JAMES REFINEMENTS.

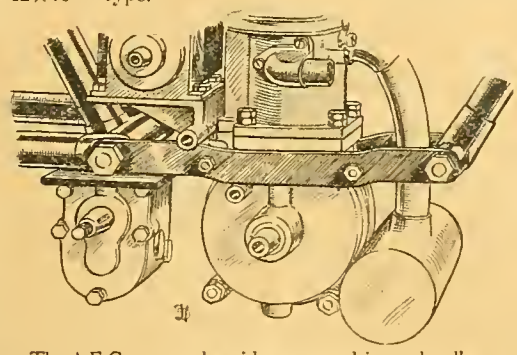
The 2¼ h.p. two-stroke James, though it remains unaltered in its essentials, has undergone one or two refinements, and is now a very striking looking machine. The sheet metal chain cases are very well carried out and look extremely neat with their black enamel finish. The well-known James staggered cooling ribs have now been standardised, and another distinctive feature is that the change-speed lever has been brought up through the centre of the tank and works in a quadrant on the top tube, where it is conveniently placed for the rider. The exhaust from the release valve is led away to the back of the engine by a long pipe, and is clear of petrol fumes.

A NEW LEVIS FOR 1915.

We hear from Messrs. Butterfields, Ltd., Stechford, Birmingham, makers of the Levis, that they have for some time been testing a new engine of 53×70 mm. bore and stroke, giving a capacity of 198 c.c., and from this engine such excellent results have been attained that it has been decided to adopt it for the 1915 Levis.

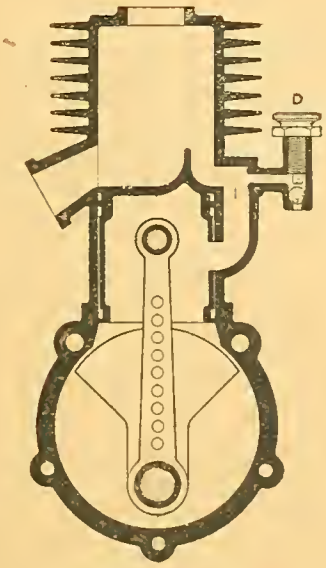
THE 2¼ H.P. PARAGON.

THE Paragon engine differs from our specimen sketches in that the gas is transferred through ports in the piston wall. The Clyno and Connaught are other examples of this type.

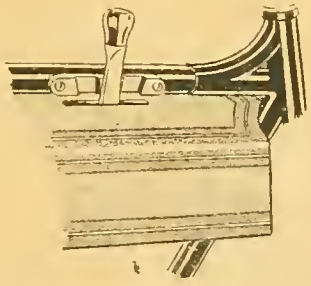


The A.E.C. two-stroke with magneto drive and pulley removed to show engine and gear box carriers.

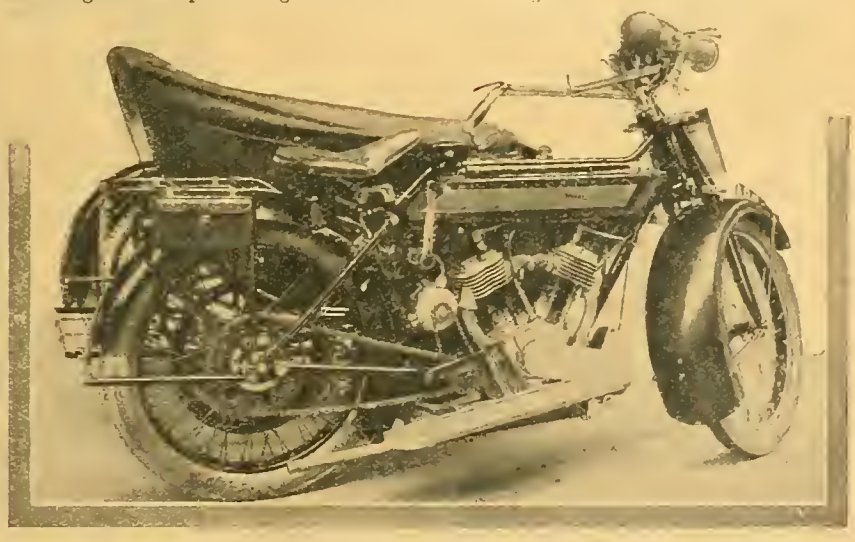
The accompanying sketch shows the latest design of Paragon two-stroke used on the Paragon motor cycle and manufactured by the Portway-Cooper Manufacturing Company, Lower Brantham, near Manningtree, Essex. The bore and stroke respectively are 66 mm. × 70 mm., and the cubical capacity of the cylinder 239 c.c. The engine is of the three-port type, and possesses several new and interesting features, among which we may mention an auxiliary air scavenging device D, which works in the following manner: A is a non-return valve of the ball type placed in the transfer port B, by means of which the transfer passage B' is filled with pure air at each up-stroke of the piston. When the exhaust port C is partly open the transfer passage B2 on the opposite side of the cylinder also begins to be uncovered, at which point most of the exhaust gases leave the cylinder under their own pressure, whereupon pure air rushes through the transfer passage B, followed by a fresh charge of gas, sweeping out what is left of the exhaust gases and preventing these from contaminating the new charge. After much experimenting the Portway-Cooper Manufacturing Company have found that this device adds greatly to the efficiency and economical running of the engine.



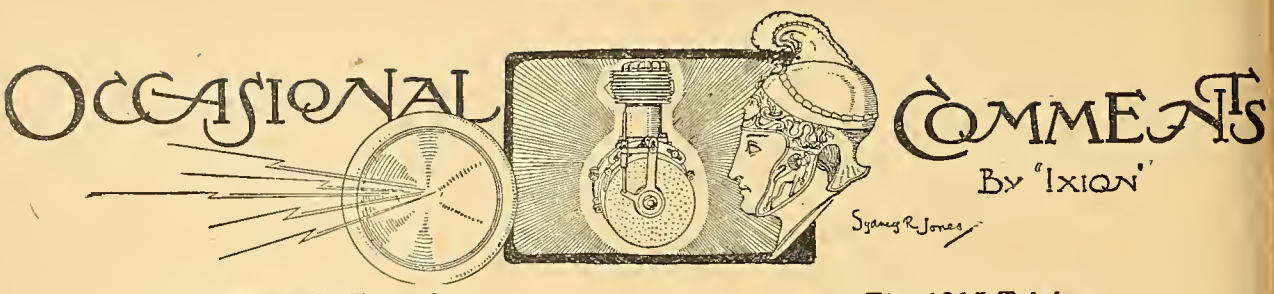
Section of the Paragon engine.



New gear control on the James two-stroke cycle, showing how the tank is designed for the gear lever to project through it.



One of the 8h.p. Enfields in the English Six Days Trial. As will be observed, this machine has the Lucas dynamo fitted to the rear down tube, a frame with dropped top tube, and a new design front mudguard. A sidecar brake was also provided.



The Sheffield Farce?

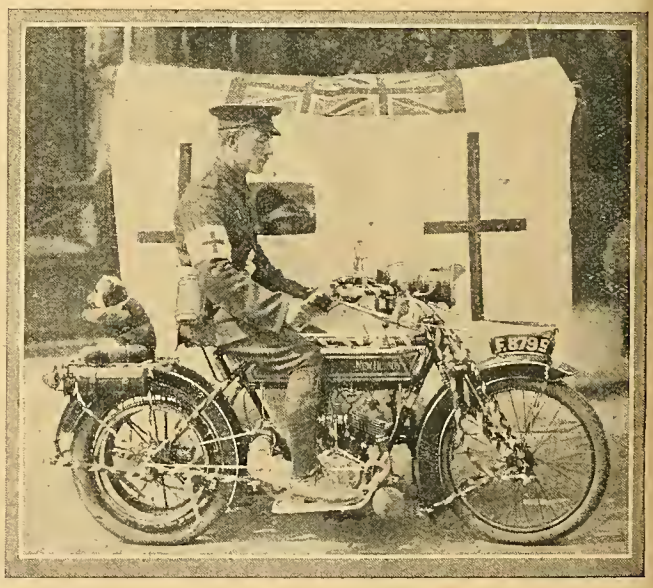
The A.C.U. have my sincerest sympathy. They realise it is their business to differentiate the first class, the second class, third class, and "dud" motor cycles from each other in the interests of such members of the general public as lack inside knowledge of the market. (It used further to be their business to develop and perfect the motor cycle—but that portion of their duties is over, so far as the Six Days are concerned, for the best modern motor bicycles are as good as present knowledge and design permit.) This differentiation cannot be effected by the old-style trial, consisting of a thousand miles of main road, including no worse gradients than Birdlip and Wenlock Edge. I believe I could get a gold medal in such a trial with a 1903 2¾ h.p. Excelsior, provided I was allowed to put a three-speed hub on it; at any rate, any clever rider could make pretty certain of his gold medal with one of the worst 3½ h.p. 1914 machines. Hence the Auto Cycle Union were compelled to launch out; and the line they took was to shorten the mileage in order to include a series of pseudo-scientific and rather petti-fogging technical tests of brakes, petrol consumption, acceleration, and the like, whilst the abbreviated mileage was planned to include a hair-raising, palpitating collection of up and down precipices, a sheet lightning series of freak hills, disfigured by the most appalling surfaces. I do not see what else the A.C.U. could have done. Their mandate from the trade was "organise a six day trial which some of us can get through!" Their mandate from the public was "Help us to distinguish the 'duds' from the 'good 'uns!'" The Sheffield Trial was a tolerable compromise between the two mandates, and a plucky one at that, for it has irritated the trade not a little, jeopardised the authority of the Union, and rendered the whole position with regard to the 1915 Trial one of no small complexity and delicacy.

Where the Trial Misfired.

There will never be any real dissatisfaction with a trial which gives every honest machine a solid chance of a gold medal. There will always be dissatisfaction with a trial which makes it a toss-up whether the best machine in the world finishes or not. *The personal factor must be eliminated as far as possible.* To secure this ideal, we must avoid freak hills, and we must dispense with tests which call for trick riding; dispense, if possible, even with such mild diversions as brake and acceleration tests. (What tourist cares enormously for the last varnish of accelerative vivacity, what need is there of a formal brake test when a machine has covered such a course as last week's fearsome 675 miles?) Here we come into collision with the mandate of the general public; for if the course be too simple, the "duds" will get their golds, and tie for the team prize with the best machine in the world.

The 1915 Trials.

Honestly, I can see but two alternatives which unite respectful obedience to the two reasonable mandates by which the Union must act. The most practicable is a firm adherence to decent roads, coupled with an extension of distance. I never knew a Six Days Trial yet in which quite half of the entry were not in a pretty rickety condition by the last day. I do not mean that their engines were worn out, or their frames on the point of collapsing; but I mean that a seventh day on the road, under even that loose observation which is possible in a Six Days, would have dropped them with a thud from the gold medal to the silver medal grade. A 2,000 miles trial over main roads in 1915, including, if possible, 1,000 miles in Scotland, would certainly differentiate between the various grades of machines, and would leave the "disgruntled retirants" no excuse for failure but the poor quality of their mounts. If the Manufacturers' Union can be persuaded to face the additional expense and to dispense with the services of two or three valuable men apiece for a fortnight in the busy season, this is by far the most promising solution. The R.A.C. was forced to resort to it several years ago, and I see no alternative for the Union, which is really sound. One of our correspondents recently suggested another plan, which sounds grotesque, but is not unpracticable, namely, that every machine of 500 c.c. and over should compete with a sidecar attached and with an observer



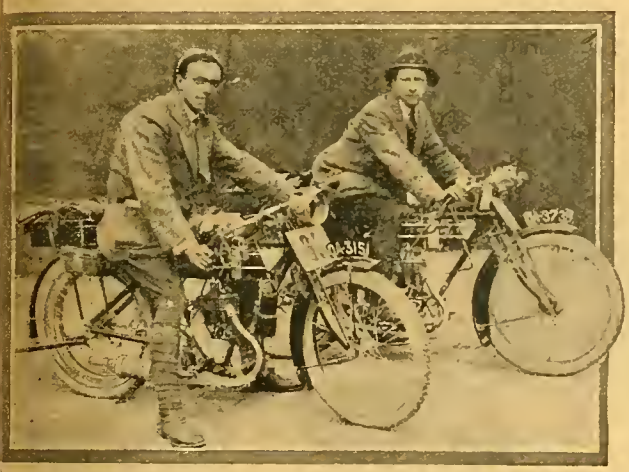
A military motor cycle ambulance seen in a procession at Ilford in aid of the local hospital. The machine is a 6 h.p. New Hudson.

ecasional Comments.—

n the sidecar, the trial to be conducted on a purely ion-stop basis. Entries would have to be limited n order to obtain a sufficiency of trustworthy observers. Tyre stoppages could at last be left unpenalised—within reasonable limits. Most modern machines re specifically designed for sidecar work—at least n occasions. This policy is entirely practicable, and f a fortnight's trial proves impossible, the idea is well worth a trial. Why should not machines be ested under the conditions for which at least 50% f them are purchased?

One Result of the Sidecar Policy.

The majority of petty stoppages are sustained for ooted plugs and minor transmission adjustments. As a consequence of a trials policy, which punishes neither of these ultra-common defects, we still suffer rom crude lubrication systems and transmissions which are unduly tiresome to attend to. Three ears of Six Days Trials on a non-stop basis would go far towards equipping us with scientific lubrication systems, and with chains, chain cases, gears,



A couple of 2½ h.p. New Imperial-Jap machines, which survived the strenuous conditions of the A.C.U. Six Days Trials with Sheffield as centre. They were ridden by J. Drew and P. S. Taylor.

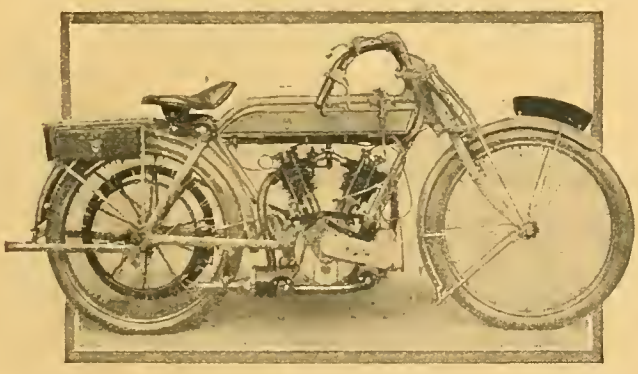
etc., which required less attention than their present forerunners, and demanded less expenditure of time when the inevitable stoppage arrived. Nevertheless, I confess that the 2,000 miles plan has my preference. Over and over again have I used a machine of re-nowned make with vast pleasure for eight or nine hundred miles, only to find that, as it approached its fourth figure, the power fell sadly away. I do not apprehend that many machines would expire during 2,000 miles of main road work. But I am sure that many would encounter trouble with their detail work, and that the majority of the engines would be a full 25% less powerful at the finish than they were at the start. Such a trial would be peculiarly interesting if a power test, *e.g.*, speed on the track, commenced and concluded the fortnight; and the award of cups for the best performances in all classes would induce entrants to undergo such power tests without "foxing." A minimum speed of 50 m.p.h. could be demanded from all the 500 c.c. machines prior to the start; and the finishing track test, for heavy

Tilting at the ring on motor bicycles was one of the events included at the Lillywhite sports at Foleshill, Warwickshire.

bonuses, would, of course be a genuine "all out" affair

A Better Way.

I am all in favour of gold medals being restricted to riders who obtain a perfect time and reliability score; and also of such trifling errors as those described above being disregarded *in toto* on rational evidence, especially where a man is accidentally *early*. If a man is *late*, and produces some excuse, I should require the most convincing evidence to admit his claim to a clean sheet; but I should feel it my duty to receive and to weigh all the evidence, because it is not a matter of whether Jones shall gratify his personal pride by winning a gold medal, or whether the Whirlwind Co. shall gain the team prize or not; it is a matter of supplying the public with accurate and lucid information. But there was no excuse for that Irishman's bonus, and I hope no future trial will be disfigured by so ridiculous an anomaly. Fancy climbing all the frightful test hills, bringing your machine through in perfect condition, being well ahead of time at thirty-nine checks out of forty, being a minute early at the fortieth check because your watch had suddenly accelerated about 1½%, and then being published as worthy of only 144 marks out of the maximum 195! (I ought to add that I was not a competitor, or my criticisms may be discounted as being interested.)

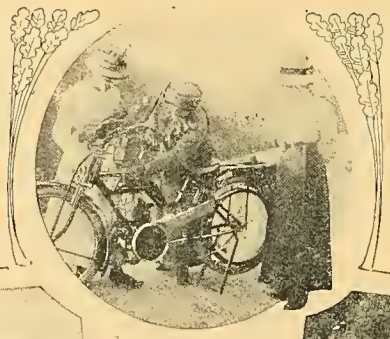


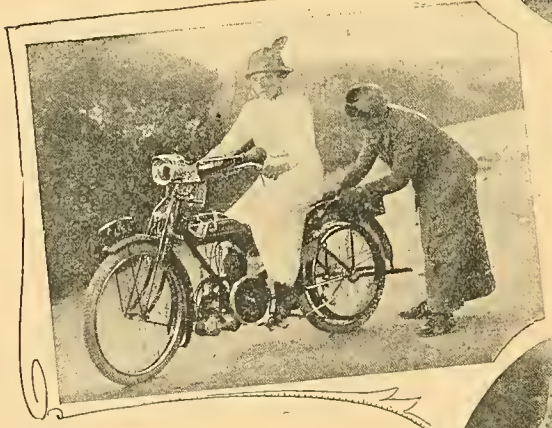
A 3½ h.p. overhead valve Hazlewood, built to special order. This is a very neat example of a fast roadster, but will not be made a standard model.

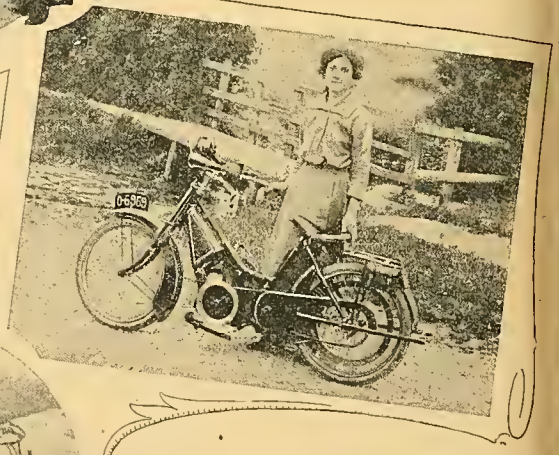
THIS week I am going to talk upon two-strokes, to discuss their suitability for feminine requirements, and to review several interesting models that have been placed at my disposal by the courtesy of their manufacturers. The two-stroke is generally a lightweight machine, and as such appeals most strongly to the novice and the fair sex, especially as it can so easily be placed in a low frame.

The first machine that I would mention is the Velôcette, a low-built open-framed mount of pleasing design. The frame, finished in black enamel, allows ample dress room. The engine is of $2\frac{1}{4}$ h.p., made by Messrs. Velôce, fitted with two-speed gear controlled from the handle-bar. The manufacturers of the Velôce are, I believe, famous for its effective lubrication arrangement. A small oil sump, holding a pint of oil, is fitted in the left side of the crank case. Pressure from the exhaust gases is so directed that lubrication is forced automatically

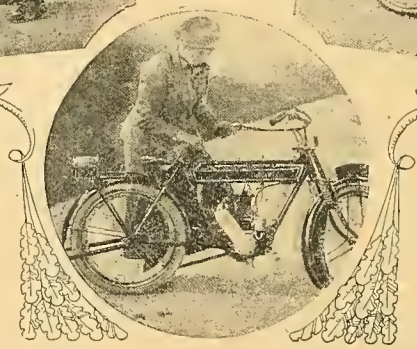
LADIES AND LIGHTWEIGHTS.







(2) Her first ride. "The push off."



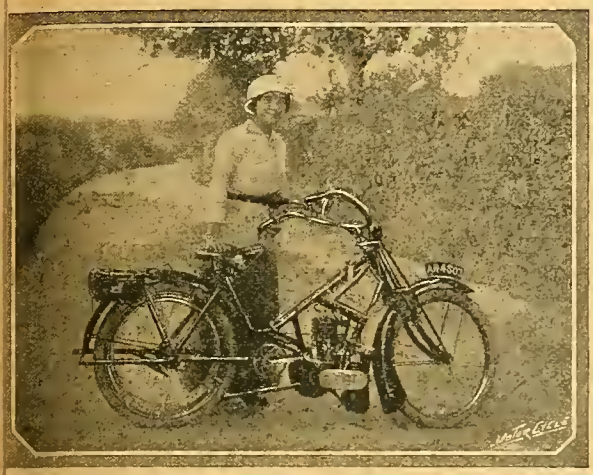
(1) Instructing novices in the use of the spark lever.
(4) The Hobart two-stroke.

(3) The Velocette.

—certainly an ingenious method to carry the necessary oil to the working parts! The flywheel is fitted on the left side of the machine, and the drive is by means of chains, and although I gave this tiny mount a good testing on the road, I never noticed anything harsh in the transmission. To protect the skirt of the rider a small metal guard is fitted over the engine. The sparking plug projects through an aperture in this. I wondered whether this being so exposed would cause shorting in wet weather. Possibly not, or the high tension wire would be carried under the engine shield. The wheels are but 24in. in height. Aluminium footboards are fitted. These are a great advantage for comfort over tiny foot-rests, but even these would be improved if covered with rubber to absorb vibration and to give the feet more grip. In all my tests the Velôcette showed up well, the top gear giving smooth running and the low the slowest of speeds for traffic. This mount, fitted with a Senspray carburetter, is priced at thirty-two guineas.

The Two-stroke Hobart.

Another attractive little machine, particularly light and lively, is the new Hobart two-stroke. In appearance it is especially smart, its highly finished black and gold tank making it look like a miniature "Sunbeam." The $2\frac{1}{4}$ h.p. engine, of Messrs. Hobart Bird's own manufacture, is quiet and efficient. The magneto is fitted behind the engine, well away from the mud and water splashes of dirty weather. Lubrication is



Miss May Sansom, of Redbourne, with her open frame Connaught two-stroke.

effected by mixing oil with the petrol in the usual quantity, viz., half-pint of oil to one gallon of spirit. Again the Senspray carburetter was fitted as standard. The machine is only single geared, and driven by ¾in. Dunlop belt. I gave the machine a good gruelling over country roads, and found it capable of thirty miles an hour on the level. The height from the ground is lower than in most diamond framed machines, partly accounted for by its 24in. wheels. Foot-rests are fitted as standard, but, if I may make the suggestion, foot-boards would be an improvement.

The Royal Ruby.

Made in Manchester, this is a mount of striking appearance, as the tank is finished in the colour that befits its name. It is fitted with a 2½ h.p. Villiers engine, two-speed counter-shaft gear, a ¾in. Lyso belt giving the final transmission. An Amac carburetter is fitted as standard. This machine is well worth a trial, its detail work being especially good. The rear brake has a direct pull operated by a pedal at the rider's left heel. The tank, too, has a filler cap worthy of the name, and the belt pulley is of sensible dimensions, thus lessening belt wear—nothing seems so disastrous to belts as the tiny pulleys sometimes fitted. I put the machine through a test containing a long hill which boasts a gradient of 1 in 8. The engine answered readily, and I changed into bottom gear only for the top portion. From a lady's point of view the Royal Ruby is easy to handle and comfortable to ride.

The Two-stroke Chater-Lea.

Messrs. Chater-Lea, a name which has long been associated with high-powered sidecar outfits, are now turning their attention to a two-stroke lightweight. With an engine of 2¼ h.p., the machine placed at my disposal has a diamond frame and is fitted with a counter-shaft two-speed gear. The standard specification includes a comfortable Brooks saddle and Palmer tyres. On the road the machine travelled well at 25 m.p.h., but was inclined to choke at higher speeds—most probably due to its being fitted with a jet of unsuitable size. The drilled belt pulley is an exceptionally large one. Oil and petrol are mixed in the usual quantities. The mount lent to me for a trial was by no means new, but its climbing powers were vigorous and praiseworthy.

The New Ryder.

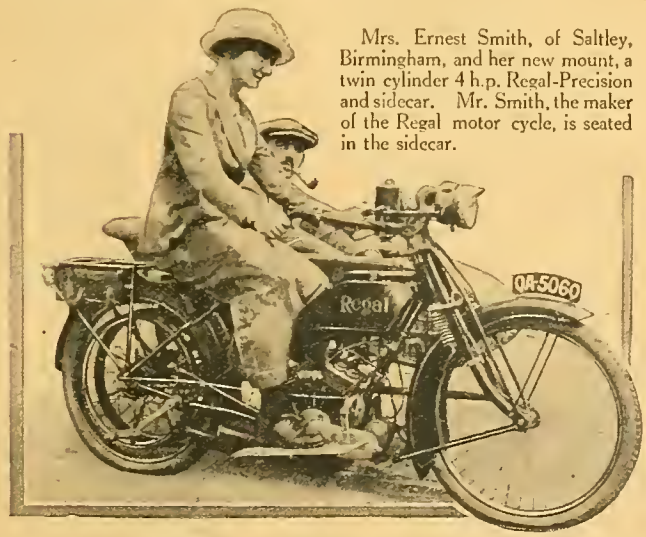
This is made in both open and diamond framed models. The open framed lady's model is the first of this make that I have handled. It is fitted with the popular Villiers 2½ h.p. engine and silenced so effectively that it is one of the quietest machines I have ridden. The frame is well designed and has a neat dress shield fitted and a well-made belt guard right from pulley to back wheel stays. The tank capacity is half gallon with a separate compartment for oil. Lubrication is effected by giving one charge of oil from pump to each half gallon of petrol. The carburetter is a Senspray. Twenty-six inch wheels are standard, and no one could wish for a simpler machine to ride.

If I may here suggest an improvement, footboards, already mentioned, are essential to the fair rider's comfort, and, in my opinion, a clutch should always be standard on a lady's mount. The two-stroke engine, if in tune, starts with the first push of the machine, but where no pedals are fitted a novice has either to have a push off or make a running mount, and this one is loth to do until one becomes perfectly familiar with the machine. Personally, this would not trouble me, as, being an "old hand," I can generally manage to climb astride anything on wheels, but one young lady of my acquaintance, who has yet to make her first running mount, when wishing to start, casts her eyes about for someone to whom she can apply for the necessary assistance.

The Connaught is another two-stroke that caters for the fair sex. A friend of mine who has recently invested in one is quite pleased with its pulling powers and generally good behaviour.

I cannot close without a word on the open framed Levis. The machine I had on trial some time ago was so satisfactory that I was quite sorry to part with it. Two firms who inform me they are shortly placing a lady's two-stroke model on the market are Messrs. Newman, of Birmingham, and the Clyno Engineering Co., of Wolverhampton.

A little tip that I have found of benefit on two-strokes is to shake a machine that has been standing all night. This removes the heavy oil from the bottom of the tank, and naturally gives a better mixture to start off with.



Mrs. Ernest Smith, of Saltley, Birmingham, and her new mount, a twin cylinder 4 h.p. Regal-Precision and sidecar. Mr. Smith, the maker of the Regal motor cycle, is seated in the sidecar.

The Action of a Two-stroke Engine.

IN spite of the fact that the two-stroke engine has become so popular of late and is appearing on the market under the protection of the names of the best known manufactures and designers, there are many who do not realise the extraordinary simplicity of the engine or the principle on which it acts. In consequence, a series of diagrams has been prepared with the object of explaining as clearly as possible the cycle of operations.

The diagrams show a transverse sectional elevation of an imaginary two-stroke, designed to show some of the most usual features of present-day machines.

Fig. 1 shows the piston at the top of its travel. It will be noticed that the lower edge of the piston is above the top of the inlet port and that gas is still flowing into the crank case and lower part of the cylinder, due to the partial vacuum caused in these parts by the upward movement of the piston before reaching its highest point.

To simplify the explanation the reader is asked to imagine that above the piston is a fully compressed charge on the point of being fired; how it got there will appear in due course. The force of the explosion taking place above the piston naturally drives it downwards with the following results. First the inlet port is closed by the lower edge of the piston, so that the gas, drawn into the crank chamber on the up stroke, becomes slightly compressed. Next, the upper edge of the piston begins to uncover the exhaust port, which, as is shown in fig. 2, opens somewhat before the transfer port. This reduces the presure of the exploded gases to something approaching atmospheric pressure before the transfer port is opened.

Fig. 3 shows the piston at the bottom of the stroke with both transfer and exhaust ports wide open. The arrows show the charge compressed in the crank case being transferred to the cylinder and taking the place of the previously exploded charge. The use of the deflector is now clearly seen, for it turns the incoming gases upwards, where they help to push out the exhausted charge, instead of shooting straight across the piston head and out of the exhaust port as would

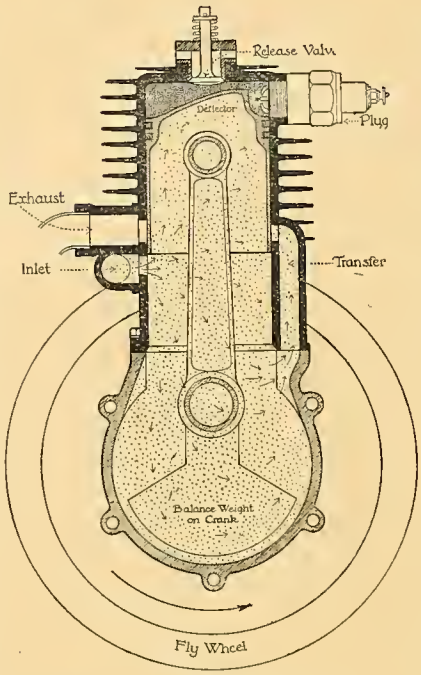


Fig. 1.
Compressed change on point of firing—Exhaust and transfer ports closed—Inlet port open showing gas filling crank case and lower part of cylinder.

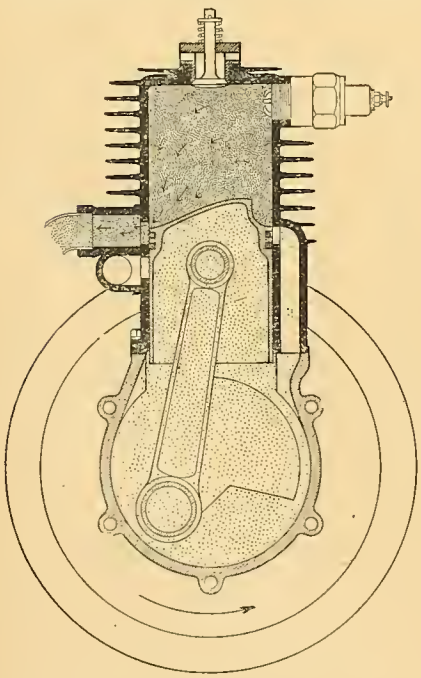

Fig. 2.
End of explosion stroke—exhaust port partly open—exhaust gases commencing to pass out—Inlet port and transfer port closed—Gas in crank case fully compressed.

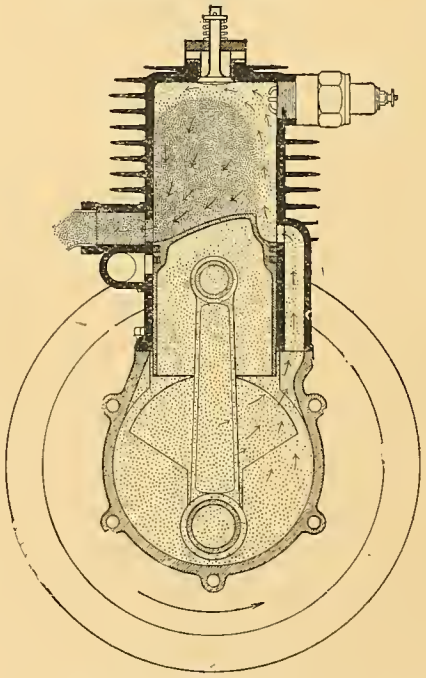

Fig. 3.
Piston at bottom—Exhaust and transfer ports open—Inlet port closed—Fresh charge passing into cylinder via transfer port and deflector plate, exhaust gases (shaded darker) passing out.

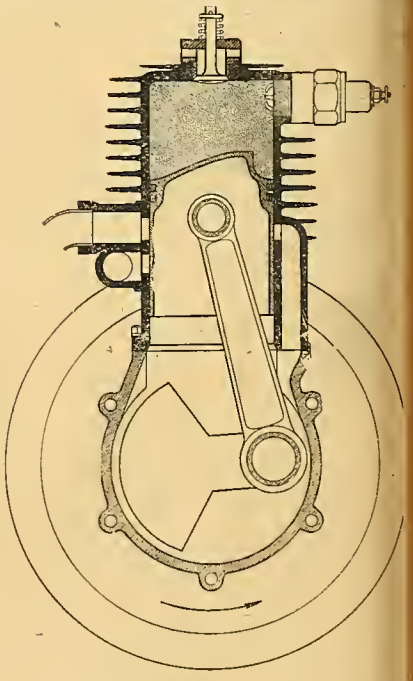

Fig. 4.
Piston rising—All ports closed—Fresh charge being compressed—Partial vacuum in crank case.

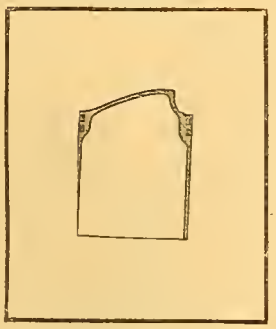
e Action of a Two-stroke Engine.—

ppen if there was no deflector. When the piston arts to ascend once more, firstly the transfer port is osed and then the exhaust port.

In fig. 4 the piston is part way on the up stroke th all three ports closed and the transferred charge ing compressed above the piston ready for firing, hile below the piston a vacuum is forming, the gative pressure of which will increase until the let port is uncovered by the lower edge of the piston, hen a fresh charge of petrol and air will be induced d the cycle will proceed as before.

This then shows clearly how an explosion takes ace once every complete revolution of the crankshaft, stead of every other revolution as is the case with e four-stroke type. It must not, however, be agined that double the power is produced, as, for rtain mechanical reasons, each explosion of a two-stroke is less powerful than that of a four-stroke of similar capacity.

CUT THIS OUT.



By placing piston on cylinder diagrams the port openings may be clearly seen in all positions of the piston

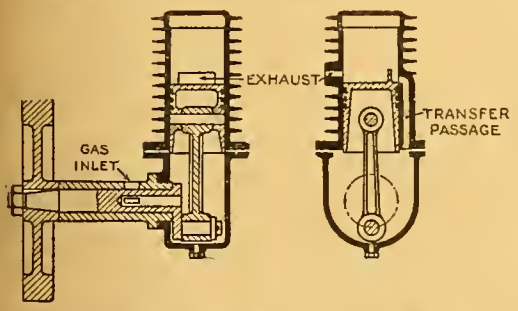
To follow the action of a two-stroke engine and the various port openings, cut out the drawing of the piston adjoining, stick it on a piece of card, and fit it inside one of the engine drawings which are given on the opposite page. By moving the piston up and down, the port openings will be seen, and it should be possible for the merest novice to acquire the principle of the two-stroke engine.

The Two-stroke Lightweight.

BY ERIC W. WALFORD.

TO the writer it seems that the two-stroke engine is almost ideal for lightweight machines, for a number of reasons.

The majority of riders of these machines are inexperienced, and the two-stroke engine, on account of e absence of valves, requires very little attention. he only two parts liable to become deranged are the agneto and the carburetter, and both can easily be etached from the machine and sent back to the makers r re-adjustment. The magneto runs at engine eed instead of half engine speed, as on the four-roke engine, so that at low engine speeds there is ore certainty of firing. The suction in the crank hamber suddenly acts on the carburetter, so that car-uration at low speeds is more certain. For this



The Ixion two-stroke engine, now twelve years old.

eason and for that mentioned in connection with the agneto, the two-stroke engine should be an easy tarter.

Another important point concerning the lightweight wo-stroke is that a larger belt pulley can be used han with the ordinary type of engine, so that the iny pulley usually employed on lightweights, with ts accompanying belt troubles, can be dispensed with. With the small engines likely to be used on light-weight machines cooling troubles are hardly likely to e met with, though with larger engines the general pinion is that water cooling is essential. To this nust be added that the two-stroke engine is lighter nd smaller for a given power—both important points n a small machine.

Many old motor cyclists will remember that in 1902 a lightweight machine with a two-stroke engine was produced. I refer to the Ixion motor, and it may be of interest to describe this, as it possesses some features very different from those almost universally employed in the modern two-stroke engine.

An Ancient Two-stroke.

From the drawings it will be gathered that crank case compression was used, with the usual transfer passage through which the gas passes and is deflected by means of a baffle on the piston up to the top of the cylinder. There is the usual bottom exhaust port, but gas entered the crank chamber through the hollow crankshaft. The crankshaft was bored out for a few inches and a radial slot was formed which came into register once per revolution with a port in the crankshaft bearing. Thus at the right time once per revolution the crank chamber drew in gas from the carburetter through this port and hollow crankshaft. Nowadays, nearly all successful motor cycle two-stroke engines such as are used on lightweights are of the three-port type, there being two ports above the piston, as in the engine illustrated, and one port in the cylinder wall, which is only uncovered by the piston when it approaches the top of its stroke.

The Ixion engine illustrated was fitted in front of the steering head of the machine, and a friction pulley attached to the flywheel was pressed against the tyre, the whole engine being rocked to move the pulley into and out of contact. I rode one of these machines once or twice. It was geared very low and did not compare at all favourably with the modern two-stroke lightweight. In fact, the one I used would not reach a higher speed than twenty miles an hour. A larger engine than this was eventually made, but it never met with any great success.

AN ILLUSTRATED BUYERS' GUIDE

(compiled by "The Motor Cycle") of 55 Two-stroke and Lightweight motor cycles will be found on pages 131 to 142 of this issue.

What Lightweights can do IN LAKELAND

By GEORGE D. ABRAHAM,
Author of "Motor Ways in Lakeland,"
"Mountain Adventures at Home and Abroad,"
"The Complete Mountaineer," etc., etc.

The two-stroke Clyno lightweight topping Hill Step on Honister Pass.

IT is over three years since a crowd of enthusiasts gathered on the heights of Honister Pass to watch the first ascent of the notorious hill by a sidecar. We all remember how, 'midst a cloud of smoke and a roar of engine, the Clyno wriggled and jumped up the fearsome gradient on the Buttermere side at the first attempt. There are also memories of innumerable motor cycles hurled at the shaly, slippery scarp by redoubtable riders who were loth to acknowledge defeat. Handicapped by high gears and single speeds, many a sportsman bit the dust, or would have done but for the utter stoniness of the road. The local opinion that no motor cycle could climb Honister Pass was almost justified. On that occasion only Vernon Taylor on a powerful single-cylinder Rudge made what might be called a clean and satisfactory ascent.

Since that record day and the one shortly succeeding it, when C. R. Collier mounted the pass on a Matchless sidecar machine, the place has lost none of its terrors. Motor cars stick regularly on the hill, and have to be rescued. Our proposal to include the climb in last year's Six Days Trials brought only a negative smile from the secretary of the A.C.U. It is still looked upon as the limit in the way of hills. Thus my suggestion, which came originally from the editor of *The Motor Cycle*, that lightweights might climb the pass was received locally with scant encouragement. "Utterly impossible!" was the remark of one enthusiast. How could engines little more than half the size of those used such a short time ago succeed? Yet again the impossible has been achieved, and now there are rumours in the air that a lightweight might climb Skiddaw, with its almost trackless steeps and heather frontage. Unlike Snowdon and Ben Nevis, there are no proper tracks or roads to the top of Lakeland's mountains.

These ultra-modern light machines are decidedly scarce in the vicinity of Lakeland, and the popular doubts of their capability in such a hilly country would doubtless largely account for this. Thus there was great difficulty in finding enthusiasts who would tackle the notorious hills. This seemed unnecessary modesty, for an O.K. had shown its abilities by clean ascents of Kirkstone Pass from Ambleside, and also Red Bank at Grasmere, despite a day of excessive moisture and mud. A 2¼ h.p. Triumph as well as a 2¼ h.p. Clyno climbed the old road up Honister Pass from Seatoller splendidly. The gradients here are severe and stony, while 1 in 4 and 1 in 4½ stretches are frequent.

Preparing for the Attack.

But my plans to get a representative number of lightweights on the westerly side of Honister Pass or on Buttermere Hause seemed doomed to failure. The O.K. had an unexpected appointment to fulfil, and another—or at least its rider—had married a wife and could not come. Thus, after another postponement through bad weather, we finally foregathered a few days ago at Buttermere Hotel, to find only a Connaught and a Clyno to represent the lightweight brigade. There were several big machines, a few quite suitable for the work in hand, so an interesting time was expected.

Over rain-sodden roads we had reached Buttermere by Lorton, having skidded up one side of Whinlatter Pass and slid down the other. The air was heavy with vapour and great mist curtains were unrolling themselves from the grey mountains which rose over the roadway. The village weather prophet was consulted when a slight rain began to fall. In characteristic dialect he answered guardedly: "Ay! ay! it'll mappen, donk and dezzle a bit, an' appen cast a snifter, but ther'll be nea greet pelt!" Southerners in the party were as puzzled with this as though it were some foreign tongue. Translated tersely, it meant there would be light showers but no great pelt or downpour, which was reassuring.

Thus first of all we set forth for Buttermere Hause. From the seat of a remarkably useful Rudge sidecar I had an excellent opportunity of realising the efficiency of a typical up-to-date lightweight. As we curled up into the misty heights, and climbed the long upper rise, where 1 in 4½ was the prevailing gradient and deep

What Lightweights can do in Lakeland.—

Crosswise-running ruts provided the prevailing surface, when there was a roar from below. It was George Braithwaite on the Clyno, and soon he whirred past us and up to the final zig-zag, negotiating this and the awkward ruts with a master hand, but never a foot. The Clyno took a weight of over thirteen solid stone up without a falter, and the slow, steady pull of the little engine was astonishing to those accustomed to the thrilling rushes of the bigger machines, which usually need skilful footwork on the hairpins. The contrast was soon in evidence, for Jeffreys, a famous north country speedman, came up next. But he jumped over the ruts carefully because the low-set crank case of his 8 h.p. Zenith had already one breakage plugged by a cork.

reached, but from the steeper side. The easterly approach to the famous pass was found in remarkably good condition, for the newly-surfaced road was as yet unspoiled by the chain-skidded wheels of the heavy coaching traffic.

As usual, loose shale about a foot deep was expected, but there was now splendid grip on the firm slope, despite the gradient of 1 in 3⅝. Those coming to Lakeland this season may be glad to know of this improvement. The distance from Keswick to Buttermere over the Hause and up the interesting Devil's Elbow is only eight miles; by Whinlatter Pass it is nearly double, whilst the usual roundabout route by Embleton, near Cockermouth, is upwards of twenty miles. Any lightweight as efficient as "the two C's" could tackle the Hause route easily, and since our visit

LIGHTWEIGHTS IN LAKELAND.

The Connaught nearing the crest of Buttermere Hause.

Nearing the top of Honister Pass. Honister Crag is seen on the left

Climbing the 1 in 3¾ gradient of Hill Step, Honister Pass.

Other "big guns" followed, and then all interest was concentrated on the ascent of the Connaught. The machine had yet to win its spurs on the biggest Lakeland hills, and its rider, D. R. Leitch, was new to motor-mountaineering, but the two tyros behaved splendidly. The "wash-outs" were negotiated slowly, and the pick-up of the engine on the intervening 1 in 4½ rises was remarkable. The final corner was taken more quickly, despite the short step of 1 in 3¾, and the little two-stroke finished in perfect style.

Then the descent into Newlands Vale was made, and thence the summit of the Hause was again

an O.K., with a yet smaller engine, and a 2¼ h.p. Triumph have made the crossing.

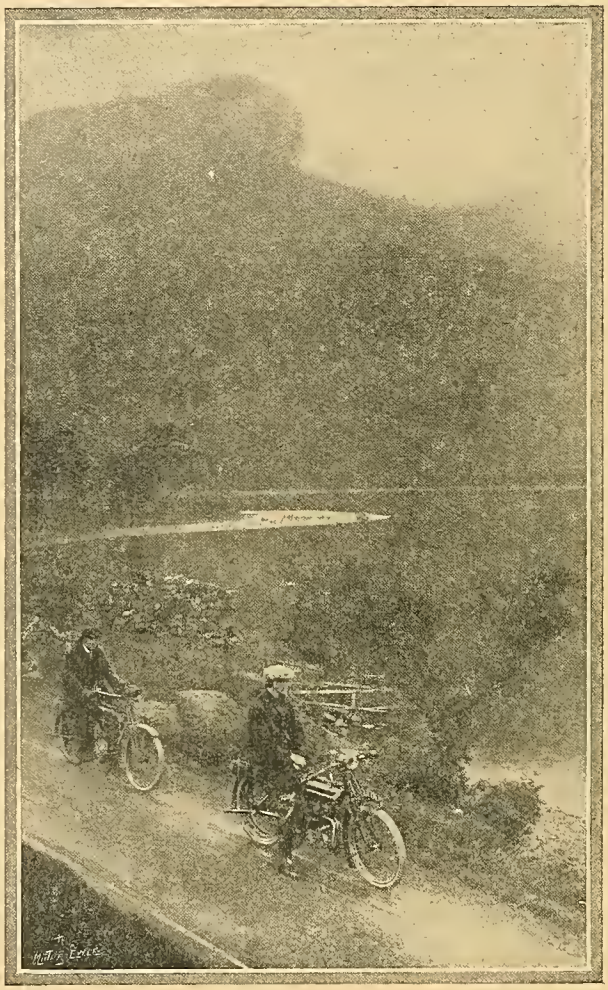
Then a slight shower chased us back into the dale, and along the shores of Buttermere we hurried Honister-wards. On such a day the approach was magnificent. The lake lay black as ink in the depths, and great clouds, the aftermath of a thunderstorm, surged savagely amongst the dark crags. Soon we entered the "narrows" of the pass, where grey cliffs plunged down on either hand, and the road darted up into the whirling mist. The Rudge, much overloaded and over-geared

What Lightweights can do in Lakeland.—

for such work, soon reached its limit on the steep, loose slope, so we walked up to Hill Step, the crux of the climb, to await the coming of the others.

What the Pass is like.

Some time ago the gradients of the Honister Pass on the Buttermere side were measured in close detail, and it may be interesting to give here the main points. First of all the surface is the impressive feature and a disturbing one withal for those who attempt to ride its rock-strewn roughnesses. In this respect it is no exaggeration to say that the road is a disgrace to the local authorities, and, considering its importance to the considerable coaching traffic which makes use of it daily, its neglect is difficult to understand. At the present time it is in an exceptionally unkempt condition, especially in the lower stretches. From Gatesgarth, the last farmhouse up the valley, to the foot of the real struggle, about $1\frac{3}{4}$ miles, the surface is good. Thence to the summit, 1,190 feet above sea level, the distance is threequarters of a mile, and the difference in level is about 550 feet. Steep and rough travelling is encountered immediately the bridge over the mountain torrent is crossed. A wide S turn culminates in twenty-two yards of 1 in $4\frac{1}{2}$ and six yards of 1 in 4. After an ensuing hundred yard stretch of 1 in 6 there comes a swerve to the right on a rise of 1 in 5, and beyond this the second bridge is approached up an easier portion of 1 in 10. This affords acceleration for the crux of the climb, which begins quickly with a gradient of 1 in $7\frac{1}{2}$, gradually becoming rougher and steepening to 1 in $5\frac{1}{2}$ for twenty-two yards. Now, on an incline of 1 in $4\frac{3}{4}$, there is a left-hand turn to the foot of Hill Step proper, which is gained over about fifty yards of 1 in 5. Hill Step itself is fairly straight with a slight swerve to the right in the upper part. The surface still grows rougher, and at the start up the "Step" the gradient of 1 in 4 to 1 in $3\frac{3}{4}$ makes the bumpy slipperiness felt unpleasantly. There is a fairly steady climb for fifty yards up the rise of 1 in 4, and then about twenty-two yards of 1 in $3\frac{3}{4}$ culminates in six yards of 1 in $3\frac{1}{4}$. After fifteen yards of 1 in 4 and 1 in $4\frac{1}{2}$, the rock-exposed, slippery, final stretch is approached. This notorious and dangerous bit is about twenty yards in length and begins with ten yards of 1 in 4. The middle part has a gradient of 1 in $3\frac{1}{2}$, and finally the six yard rocky portion inclined at an angle of 1 in $3\frac{1}{4}$ has to be surmounted. But now the gradient becomes more favourable and the surface loses some of its roughness. The upper part consists of an ascent of about 300 yards up an average gradient of 1 in 6, and just under the summit the last fifty yards steepen again to 1 in $4\frac{1}{2}$.



A halt on the shores of Buttermere Lake, with the clouds lifting off the lofty crest of High Crag.

Such was the problem the lightweights had to tackle. Few were hopeful of success, and when Jeffreys came up on the Zenith—but perhaps more correctly speaking, mostly in mid air, on account of the bumpiness—prospects seemed still blacker. The road thus cleared, a tiny black speck was seen to detach itself from the group of machines at the foot of the hill. It disappeared on the lower corners, but quickly came into sight again, flashing across the easier stretch below Hill Step. Leitch on the Connaught was soon recognised by the stubborn way he kept his feet on the footrests, even with the lively little machine leaping bodily on the shifting stones. On his first attempt, by good luck or good management, he avoided the roughest section, and whirred steadily up the front of Hill Step. The driving wheel spun helplessly for a moment, but with cool deliberation and regardless of the airy downward prospect, the rider found firm hold on the road close to the precipitous edge. Thus the final steepness was overcome, and we hurried upwards to congratulate the first lightweight rider to scale Honister Pass.

The Clyno came next, and the steadiness of its ascent was remarkable. Perhaps a previous knowledge of the soundest part of the surface accounted for this, and, after all, the experience of a motor mountaineer like George Braithwaite counts for something in the success of the machine on such a place. The steepness of the gradient seemed to have little effect so long as a grip could be found for the driving wheel. Some amusing and less graceful things happened when other experts were allowed to pilot the lightweights up the pass. Thus ended a strenuous and interesting day.

In answering this advertisement it is desirable to mention "The Motor Cycle."

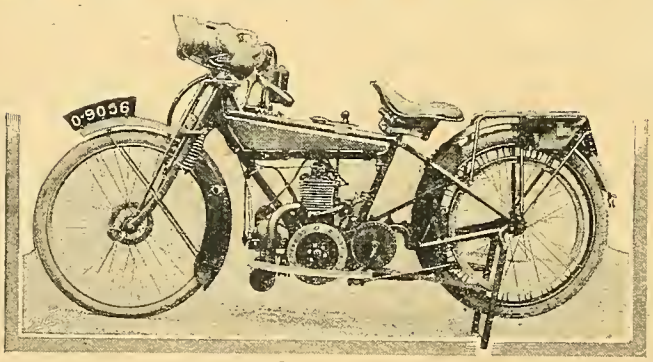
C3

Where a Lightweight Scores.—

phant conquest should be assured within a very brief period. The first problem is springing. Any motor cyclist who is also a push cyclist knows how unpleasant a bicycle feels at 10 or 15 m.p.h. by comparison with the heavy stable 3½ h.p. touring motor cycle. A somewhat similar sensation affects him when he drives a second-rate lightweight. The shocks and jars of the road are transmitted too intimately to the light frame, and his impression is that every detail "dithers" a little too rapidly. The best makers are mastering this difficulty. The little two-strokes seemed to ride the stony moorland tracks in the recent Six Days Trials quite as evenly as the heavier machines, and their riders were quite fresh after a gruelling day's rough-riding. All that is needed is sound fork design, light, stiff tubing, with perhaps more trussing and girdering than the weighty 3½ h.p. frame tubes demand, and saddles which are comfortable without being too heavy.

The Question of Keeping the Time.

The second and most thorny problem is power maintenance. A 3½ h.p. engine always has power in reserve, and when it is 50% below factory tune is still rideable. A 2 h.p. has a very narrow margin of reserve power, and if through poor design or workmanship, or by careless handling, its engine deteriorates so that only half or two-thirds of its normal efficiency is developed, the rider must continually re-



A DROPPED FRAME TWO-STROKE.

A new model two-stroke machine, which Messrs. Alldays and Onions are testing on the road with a view to adoption for 1915. It will be observed that the top tube is dropped similar to the Alldays T.T. model.

sort to his second or bottom gear, and occasionally fail to climb such hills as Birdlip. Here, too, great strides are being made. Metallurgy is better comprehended, so that valves and piston rings stand up well. The two-stroke, with its lubrication *via* the carburetter, has inspired the designers of four-stroke engines to devise small high speed power units which do not carbonise so rapidly as their prototypes. Carburation is improving with giant strides. The detachable items which affect engine efficiency, such as valve caps, are no longer so flimsy that they crumple up if they are properly tightened. Some of the smallest engines in the Scottish Trials were apparently producing their full power on the last day; the crackle of their exhausts had not become "woolly," but rang as sharp and tight as at the start. All this is vastly encouraging.

The Transmission Question.

The transmission bugbears, which vitiated the early lightweights, are things of the past. The two-step drive has banished the old dollar-diameter pulley and its resultant belt troubles; at least one baby machine got through the Scottish week without a single belt stoppage.

On the whole, I should identify the problems of providing a high standard of comfort for the rider and of designing all the tiny fittings so as to be vibration and fracture-proof as the most obstinate survivors of a dwindling catalogue of difficulties; and I should assert with confidence that the trade, as a whole, is laying masterful fingers on these familiar weaknesses.

The outlook, then, is in every way encouraging, and we may proceed to notice the special opportunities open to the baby machines.

Storage has already been dealt with. An ordinarily strong man can tuck a lightweight under his arm and carry it to the most inaccessible corner of a backyard; an old man or a young girl may throw its transmission out of gear and wheel it with consummate ease. Taking it into the road, starting it, and supporting it during stoppages are child's play. Its ease of handling will attract many tyros who shrank from the 200 lb. machines.

Economy is the real *clou* of the modern lightweight. First cost, however, fails to represent the full economy of the lightweight. After a run of a thousand miles the back tyre of a 3½ h.p. has no central studs left; the back tyre of a lightweight shows no real signs of wear after a similar distance. I inspected the rear tyre of one two-stroke lightweight after the Six Days Trial, and it looked as if it had done about 200 miles. The petrol consumption is about forty per cent. less than that of a 3½ h.p. and the transmission wears astoundingly well. Depreciation is small, because the first cost is low.

Lightweights for Lady Riders.

A side issue of distinct interest consists in the attitude of women towards the motor cycle, as it may be affected by the lightweight. The modern girl is hemispheres removed from her Victorian predecessors; she is growing more emancipated every day. There are thousands of golfing, tennis-playing girls with small private incomes and allowances, and there are distinct signs that the lightweight is appealing to them. The other day I saw a girl of 18 or so threading her way through the worst city traffic on a Levis, with her small brother on the carrier. I remember hearing a married woman practically hooted as she drove through a Midland town on her motor cycle only six years ago, but nobody even turned to stare at this slip of a girl piloting her double outfit through a busy street.

After many premature boostings and chequered vicissitudes, the baby machines are at length beyond question about to enjoy their triumph; and they will exercise a profound and far-reaching influence on the sport, industry, and pleasure of the nation.

NOTICE.

WHY I FAVOURED THE TWO-STROKE ENGINE.

By ALFRED A. SCOTT.

Mr. Alfred A. Scott needs no introduction to our readers. He may be described as the "godfather" of two-stroke motor bicycles, for it is undoubtedly due to his skill and untiring perseverance that the two-stroke motor cycle has gained such popularity. In the accompanying article Mr. Scott relates his early efforts with two-stroke engines, and why he favoured this type of motor. It is interesting to recall that the first description of the Scott was published in this journal on September 2nd, 1908, after its successes at the Sutton Bank and Newnham hill-climbs.

MY inclination towards the development of a practical two-stroke engine is no doubt due to early training and association with engineers manufacturing marine and high-speed steam engines, so that in turning my attention to the gas engine and consequently to the petrol engine, I was naturally attracted by the possibilities of the two-stroke cycle of operations by which the regular impulse, the simplicity of design, and the sound mechanical motions employed in steam engineering practice could be retained; in preference to the four-stroke with its irregular impulses and complication of valves, gearing, and cams. I do not mean to infer that in my opinion the four-stroke system is in any way defective or unmechanical; I am simply attempting to respond to the Editor's invitation to explain my early preference for the two-stroke system, and consequent neglect of the type universally adopted in the early days of motor cycles. My initial preference for the two-stroke was further strengthened by the reliable and excellent service obtained from a two-stroke gas engine designed by my brother (Mr. A. F. Scott, M.I.M.E.) and employed for many years in driving the machinery in my experimental workshop.

The writer

The two-stroke petrol engine first made a place for itself in marine work, being almost universally used for small sizes in America, and was considered eminently suitable for the purpose of driving a boat, where variation in load was not recognised and where absolute simplicity was desirable, and so long as it was confined to this field no serious attempt was made to design a two-stroke which would give the elasticity of control required for road work. I wish to avoid giving the impression that we are particularly indebted to American genius for the invention and development of the two-stroke. Priority in its invention and development can undoubtedly be attributed to Mr. Day, and in recognition of this I have frequently referred in previous articles to the Day cycle in contradistinction to the Otto cycle.

My First Two-stroke Bicycle Motor.

My first two-stroke engines were designed for marine work, and I found a decided advantage in experimenting with an engine on a boat where it was possible to make tests and obtain diagrams under working conditions.

My first bicycle motor was fitted to a Premier bicycle in 1901. The twin cylinders, 1⅞in. diameter, were made of steel tube with aluminium radiator flanges shrunk over the outside. Plain phosphor bronze bearings were first of all fitted, and later metallic bearings with floating gland joint. The engine drove the front wheel by friction contact with the tyre, a successful drive in dry weather, but useless in wet. I was delighted with my first ride on this machine, but found that the steel cylinders were quite impracticable, for, in spite of liberal lubrication, they scored badly and showed no signs of taking a polish. My next engine was a development of the same idea, but with cast iron cylinders 2¼in. bore. This engine eventually drove by belt to clutch counter-shaft and thence by chain to back wheel. One trembler coil was used, and the spark distributed to either cylinder by a simple device provided by fixing a projecting electrode on the piston head. Later on a plain coil with mechanical brake was used. A rotary contact-breaker was driven by link work from a pin placed midway on the connecting rod, and by deriving its rotary movement from the elliptical motion of the rod, a variable motion with quick and slow periods was devised, useful for the sudden interruption required in a mechanical contact-breaker. At the same time I extended the development by experimental work on a two-cycle marine engine 4in. × 4in., and by keeping this engine on the test for the greater part of a year derived useful information as to what could *not* be done. The engine was fitted with a large water-cooled brake wheel, so that it could be run at full load for any length of time without heating up. On the average this engine developed 10 h.p. at 800 revs. per minute and showed 85% mechanical efficiency.

Discovering the Curved Top Piston.

The present Scott type of piston with the now generally adopted curved top was developed during these tests, and many developments as to port proportions made and the effect observed by the brake and indicator readings. The satisfactory behaviour and proved efficiency of both the marine and the smaller motor bicycle engine convinced me of the superiority of the two-stroke for both purposes, and I decided to improve upon previous efforts and build a complete two-stroke water-cooled motor bicycle.

An accident on an early motor bicycle enforced some considerable leisure time, in which I was able to think the matter out and forecast what was wanted, and devise in its main outlines the machine associated with my name. The first complete edition of this machine (1908) had to depend upon coil ignition, but the substitution of a magneto greatly improved the rapidity of ignition and overcame the most annoying

Why I Favoured the Two-stroke Engine.—

of two-stroke troubles. It will be remembered that a twin-cylinder two-stroke firing twice every revolution consumed four times as much current as the single-cylinder engine of its time. This meant a big drain on accumulators, excessive wear on the platinum points of the mechanical break, and constant failure of the electrical equipment. The development of the magneto into the perfect machine of to-day has had a great influence in making the reliability of the two-stroke motor bicycle, where certainty and rapidity of ignition are particularly required. The absence of working valves on the two-stroke presented another difficulty. It was obviously necessary in producing a chain-driven two-stroke motor bicycle to provide some substitute for the usual valve lifter, since at that time all the early motor bicycles were controlled more or less by the valve lifter. This was met by providing a secondary exhaust port placed further up in the cylinder wall, which could be controlled by a lever on the handle-bar, so that the compression in the cylinder could be reduced at will. This half-compression lever was combined with a magneto cut-out switch, so that the engine could be completely controlled to the same extent as was possible with the ordinary valve lifter on the standard four-stroke motor bicycle.

Protests Against Two-stroke Engines.

At the outset the Scott motor bicycle was regarded as an elaborate freak by the motor bicycle world of that time, which could scarcely be expected to swallow all at once this combination of open frame, water-cooling, twin-cylinder, two-stroke, two-speed gear, kick starter, chain drive, etc., and in view of this natural conservatism, I was strongly advised to limit my ambitions and develop the two-stroke on the accepted lines of the ordinary belt-driven machine.

As far as the development of the two-stroke engine is concerned, there was no difficulty in proving immediately its efficiency in competition. I began the list of Scott wins at the Bradford club's hill-climb at Wass Bank, and then gaining three firsts on formula at the Coventry club's hill-climb at Daventry, evoked a storm of protest, with the unfortunate result that the A.C.U. was induced to impose a stiff handicap on two-strokes, which, although it did not completely stop the record of success, checked any further inducement to compete in hill-climbs, and thus materially delayed the general appreciation and recognition of the peculiar pulling power of the two-stroke engine.

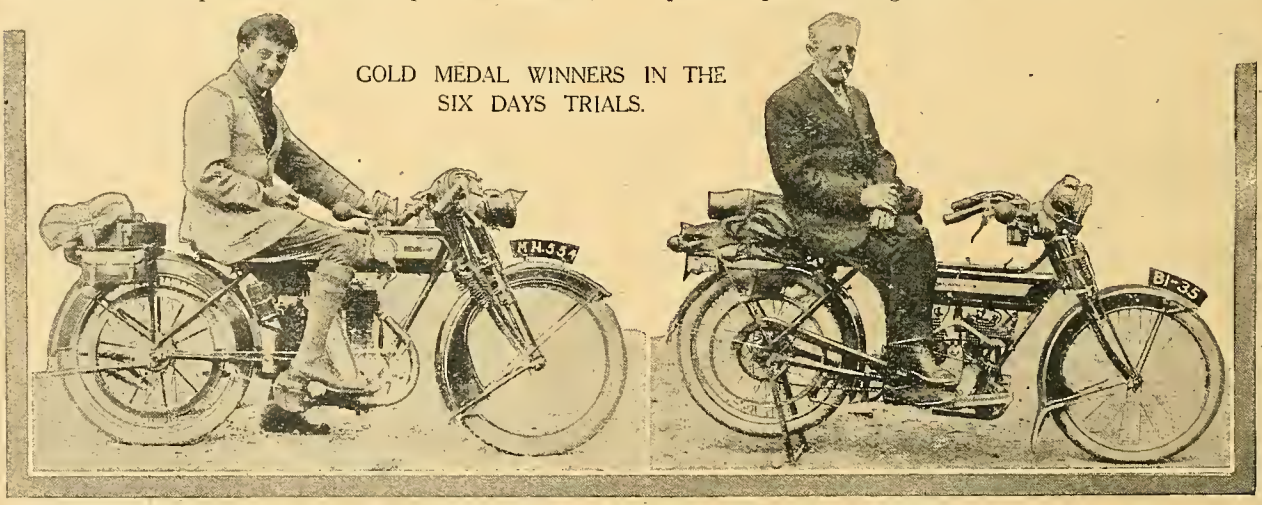
The question of exhaust naturally arises from comparison with the four-stroke, where a full stroke of the piston is spent in expelling the exhaust gases, and in addition a full stroke of the piston is utilised to draw in the fresh charge. In the two-stroke, where exhaust takes place towards the end of the stroke, the exhaust gases move under the influence of considerable pressure; in fact, a very persuasive influence to depart is exerted compared with the mild invitation extended to the contents of the carburetter. Taking into consideration the relative conditions of pressure, area and time, I feel that in some two-stroke engines at high speed this invitation to come inside must seem so casual and offhand that I can quite imagine the reluctance of the charge to enter the engine at all, and can sympathise with the natural attitude of the greater part of the mixture in remaining sullenly in the inlet pipe with a feeling of "The welcome on the mat ain't meant for me."

The Future of the Two-stroke.

In attempting to predict the tendency of future design, I would expect the ultimate success of the *simplest* means for attaining increased economy, control and power, and do not think that real improvement will be secured by the complication presented by double diameter pistons, additional displacer pumps, etc. I do not, for instance, see that any real practical advantage is gained by adopting a complicated and heavier design of engine in order to avoid the use of the crank case for compression of the charge. The crank case compression two-stroke engine, in spite of its defects, is irresistible on account of its simplicity, and I think that in future development this characteristic simplicity will be conserved.

I anticipate the successful application of the Diesel system in combination with water cooling to increase economy and efficiency of the two-stroke, and no doubt we shall depend in future upon some form of independent pneumatic ignition.

GOLD MEDAL WINNERS IN THE SIX DAYS TRIALS.



D. M. Brown (3½ h.p. Rover), who climbed every hill, gaining 196 marks plus a bonus.

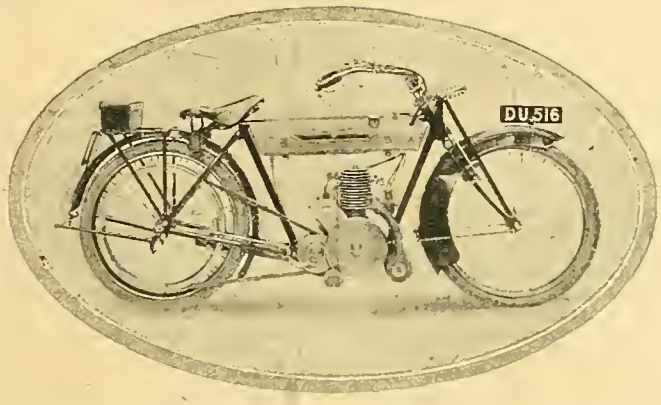
F. W. Applebee (3½ h.p. Motosacoche), probably the oldest competitor in the trial. His score was 189 marks plus a bonus.

Experiences with Two-stroke Machines.

THE CAPABILITIES OF THE JUNIOR TRIUMPH.

IN the spring we took delivery of a two-stroke Triumph, since when we have had no cause to regret our choice, as the only troubles up to the present have been of quite minor importance, such as chains getting out of adjustment and slight carbonisation.

The machine has now quite a long mileage to its credit, including several open reliability trials, but more particularly made up of short daily runs between home and the office. Sunrising Hill comes well within the range of the Triumph, as do most main road gradients. The two-speed gear box on the counter-shaft (giving ratios of 5¼ and 8¾ to 1) has always worked admirably, and the Bowden wire gear control from a lever on the handle-bars has needed no adjustment. Entirely enclosed magneto and transmission chains might be an advantage. The chains, which are protected only by dust covers, run at engine speed, and any grease is soon thrown off.



Dismantling the engine is simplicity itself, and the cylinder may be removed in a matter of minutes. All the controls, with the exception of the heel brake acting on the rear belt rim, are situated on the handle-bars, making the machine very easy to handle. Especially is this noticeable in traffic, when the low gear may be engaged and one is able to crawl along at a mere snail's pace with the engine slowly ticking over. On the other hand, with top gear in operation, a speed in the neighbourhood of the "forties" can be attained.

Starting up may be done by standing across the machine and paddling off, when the engine will fire in a few revolutions.

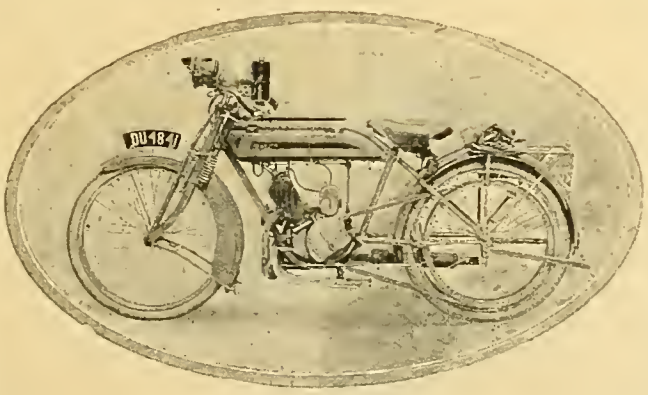
The Triumph is very light on tyres and belts, the former being still in excellent condition, and the latter having been shortened for the first time a week ago.

For best results a pure mineral oil should be used, and not compound oils, as the latter are liable to split up and cause carbon deposit. In the case of one brand of oil sent us for trial the float needle developed the troublesome habit of gumming.

The petrol consumption on an average is about 95 m.p.g., and one of the greatest virtues of the little machine is that it "two-strokes" regularly, even at slow speeds. The weight is approximately 130 lb.

2,000 MILES ON A CLYNO.

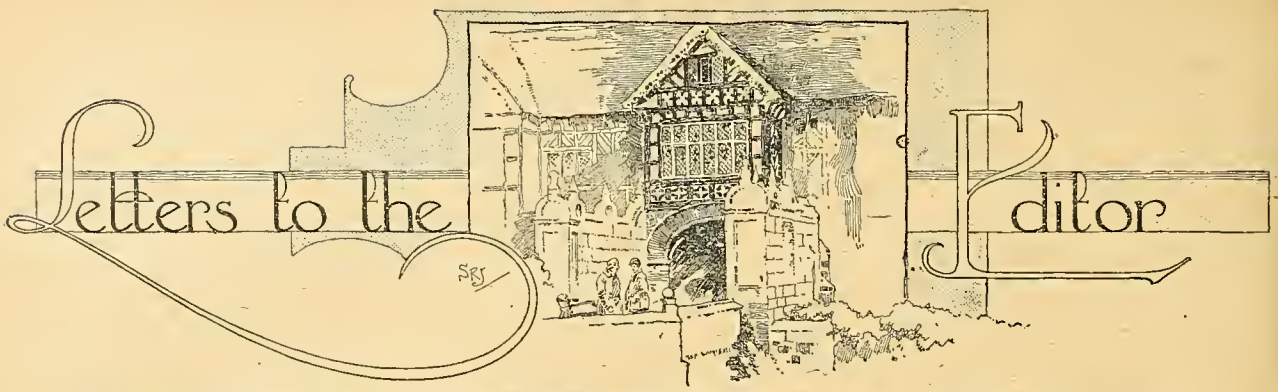
DURING February last one of our staff took delivery of one of the first batch of 2¼ h.p. two-stroke Clynos. The machine arrived complete in every detail, with lamp, horn, and Lea reflex rear light. From the very beginning it would run smoothly and well, and the power greatly improved as the moving parts ran in. The machine scales 152 lb. ready for the road, and it would be hard to find a more controllable machine to handle in traffic. The two-speed gear is simple and silent, and the handle-bar controlled clutch appears capable of being slipped indefinitely, added to which the engine will two-stroke quite slowly.



The two-stroke Clyno is by no means a toy, for it will average 25 m.p.h. over long distances; the machine in question has climbed all the well-known Cotswold hills which have been attempted, including Rising Sun and Portway hills, with ease, and will restart on the clutch on the worst pitch of Sunrising and at once pick up to a good speed on the grade. The petrol consumption with a Senspray carburetter and No. 28 jet is approximately 100 m.p.g. under fair conditions, and the oil consumption is particularly low. The belt runs over a 6in. front pulley, and consequently wear in this part is negligible, added to which the clutch shield helps to protect the belt from mud and water, and thus prevents slip to a large degree.

After about 2,000 miles of hard work the motor is in excellent condition, and shows no signs of undue wear in any part; the running is so smooth that nothing has worked loose, and the machine has proved most satisfactory in every respect.

As regards carbonisation, extraordinarily little deposit takes place on the cylinder head or piston, the worst point being the back of the deflector, which can be scraped by removing the transfer port cover and without detaching the cylinder. Like most small two-strokes, however, the under side of the piston carbonises fairly thickly, but this point has very little effect on the running of the engine. The removal of the cylinder is only a matter of a few minutes.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Four-speed Morgans.

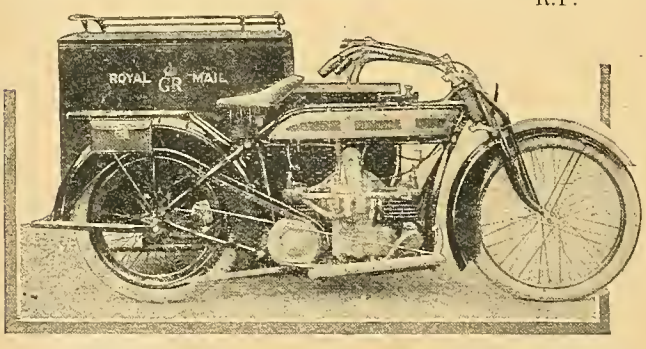
Sir,—I was surprised to read Mr. Morgan's letter about his quartette of four-speed Grand Prix machines in the Scottish Trials. As he states that the four-speed gear box is standardised, I should be interested to know whether he fits a gate or quadrant to the standard type, as some of the Scottish competitors appeared to be holding one gear lever in position, whilst their passengers prevented the front lever from jumping out of place. I am also surprised to read that three of the machines belonged to private owners. Messrs. Grout and Mundy made no secret of the fact that their machines did not belong to them, and Mr. Gibson is surely the partner of another well-known rider, Mr. Reg. Holloway, in running a garage at Torquay. Does not Mr. Morgan mean that he had only one private owner in the trials, viz., Mr. James, who, incidentally, was the sole survivor of the quartette NORTH-COUNTRYMAN.

Chills on the Abdomen.

Sir,—With reference to "Ixion's" paragraph on the subject of abdominal chills, on page 35 of your issue of July 9th, for a good many years I have adopted the practice of wrapping a long, wide, woolly scarf twice round my waist, and when pulled tight the tension in the knitting is sufficient to hold the scarf in place at the end to be tucked in. The scarf is worn under or over the waistcoat, and can be slipped on or off at a moment's notice.

This idea is really a modification of the waistband worn by the South American "Buffalo Bills," in the shape of a brilliant red silk sash, not as an ornament, but as a protection to the abdomen against the sudden change in temperature of intense heat in the daytime to intense cold at night, with a very short twilight in between. This sash is about four yards by one yard. This device has an advantage over the cholera belt worn next to the skin, as the latter, once put on, must be kept on until the weather becomes so intensely hot that it is impossible to wear it any longer. In other words, a wool scarf round the waist can be put on and off as occasion requires, but the cholera belt is, or should be, practically a permanent fixture.

R.P.



One of the 3½ h.p. three-speed Douglas Royal Mail sidecar outfits supplied to the Birmingham G.P.O.

Courtesy de Luxe.

Sir,—I would ask you to allow me to make public the following exceptional and unique treatment meted out to me by a well-known motor cycle firm, for I feel that such courtesy and consideration ought to be acknowledged.

My 1914 Indian bought in January had carried me all over the worst hills of Devon for three and a half weeks, and returning to my parish after a tour with my wife in the sidecar my gears smashed at Maidenhead. Blank despair seemed to face us, and a return by train, with visions of a heavy bill to meet on our return, seemed certain of fulfilment. As a last resource, I took the broken gears and went up to London, and asked to see the Indian manager.

My three months' guarantee ended more than two months ago, but this made absolutely no difference. The gentleman in question took me into the gear department and introducing me to the head of this department, requested him to do his utmost to enable me to catch the next train back from Paddington with a gear box in perfect condition. Tea was sent me while I waited, within an hour I caught my train, and we were on our way by 7.30 p.m., and reached my parish in Derbyshire by Saturday evening in time for my Sunday duty. The work was executed absolutely gratis.

I need add no disclaimer, for none is needed. It seems as though I, an ordinary customer, were treated in just the ordinary way according to this firm's splendid reputation.

(REV.) W. BATHURST SOOLE.

Suggested Double-purpose Machine.

Sir,—"H.J.W.P.'s" requirements are certainly not easy to fulfil, and I, personally, do not know of an engine of only 750 c.c. that will do 45.47 m.p.h. with sidecar for three hours on end on average roads, and capable of slow solo work. But then, all types of engines have not been experimented upon by me; still, if there is such a one, sufficiently tractable to ride solo at from 4-60 m.p.h. on top gear, I shall be very interested to hear of it.

My purpose in writing this is to inform "H.J.W.P." that a very good double-purpose engine is the Green-Precision, 499 c.c., water-cooled (radiator fixed to the cylinder). This engine is wonderfully flexible, whilst the makers guarantee it to develop 8 b.h.p. at, I think, 2,500 r.p.m. (which is very fair and not obtainable on the road), so that it may be assumed that a little extra power can be obtained under the highest pressure.

My machine, geared 4⅞ to 1, with coachbuilt sidecar and two passengers (total weight, 660 lb.), will average 40 m.p.h. on decent give and take roads so long as there is petrol in the tank. There is no loss of power after very hard work, neither does the water ever boil. Solo it will keep on, *ad inf.*, at 53-55 m.p.h., geared 4 to 1. The hub gear is very excellent, but there is ever the bugbear of slipping belts in wet weather. My S.A. has never given me trouble, in spite of very severe gruelling, both with sidecar and solo, but it *must* be oiled very frequently with best sperm oil.

Probably someone will say that an engine of the same capacity and air-cooled can equal, or even excel this. I should like to know if it will after running into the five figures and with all the original engine parts. I must add the usual disclaimer and remain

WATER-COOLED ENTHUSIAST.

Thunderstorms.

Sir,—I cannot agree with "X 37" that you are safe from being struck by lightning when in a motor car or riding a cycle. I only wish it were so. I have been in a car in which were four people sheltering from the storm on the summit of a hill in Derbyshire. The car was struck, and two of the occupants of the car were singed on their neck and back. One of the arms which holds the hood was twisted right round in the woodwork.

You are certainly insulated by the rubber tyres, but the power of the electricity is so great, surely a few inches of rubber will not prevent it going to earth, especially if the rubber is wet. It will jump the rubber exactly the same as it jumps the points on the plug.

I am writing this letter because it would be very serious if motorists had the impression they were quite safe when riding in a storm. W 3506.

Sir,—With reference to your esteemed correspondent "X 37" and his highly technical remarks *re* thunderstorms, may I humbly suggest that lightning is known to jump a three-mile spark gap at least. Will it hesitate or boggle at three inches? No!

I take it that most of your readers will agree that three inches is a very liberal estimate of the distance of an ordinary rim from the ground.

Also, will "X 37" please note that it may have been raining and the rubber may have been wet. R.N.

Sir,—I read with interest the remarks made by "X 37" in the July 2nd issue of *The Motor Cycle* regarding "Thunderstorms." I am not at all inclined to agree with "X 37" that in a thunderstorm "the safest place to shelter is on the machine itself, and, if a sidecar is attached, passenger and rider can cover themselves over with a gamp or sheet and defy the elements." "We are *doubly* insulated against lightning with rubber tyres and the air they contain," he also says.

It is not usual to have an overhead thunderstorm (which is the only one that matters) without rain—torrential rain; as evidenced all over London, and in many parts of the country, a week or two ago. In fact, a thunder cloud is a body of waterdrops charged at an enormously high electric voltage; much higher than that of any neighbouring clouds, and, of course, the earth's potential.

Assuming "X 37" to be sitting on his machine with sidecar attached, and in a stationary position, covered with a gamp or sheet for protection, in some open moorland, say, where there are no immediately neighbouring trees, and a thunderstorm is in progress immediately overhead. The machine or some parts of the combination would very soon become covered with rain, and this, being heavy rain, pools of more or less magnitude would form under all three wheels. The tyres would certainly become saturated enough to cause surface electric continuity to the water under the wheels. The rain would run down the spokes of the wheels, down and over the rims and tyres, to the same connecting point to earth. Where, then, is insulation of any kind provided for? The air insulation which "X 37" claims forms a *double* insulation in conjunction with the tyres, does not exist, simply because connection has already been made to earth by means of the escaping rain. Besides, the chances are, the rain, or pools, under the tyres will soon reach up to the rim on at least one of the wheels, and the fact of a sidecar being attached makes all the better earth.

Now, it is known that when a heavily charged thundercloud passes overhead it induces a charge of electricity in the ground beneath, and the tendency of this terrestrial charge is to get as near as possible to the atmospheric charge. This obtains with lightning conductors, which become "live" with the induced charge, right up to the aerial spikes. Nothing, of course, happens, as the charge in the conductor is at the same potential as that of the earth, unless the conductor is struck by the atmospheric current, in which event it will have accomplished its duty, and life probably.

In this instance (assuming the combination to be in open country) "X 37's" outfit would form the *lightning conductor*, and an excellent one too. The rain, being heavy, would cause better connection to earth the longer it lasted. The whole frame, engine, tank, wheels, handle-bars, sidecar frame, and wheel—in fact, all metallic connections that were continuous, would be thoroughly "saturated" by the induced current. "X 37" would observe no effect, as he and his passenger would be at the same potential or voltage as the earth. But it stands to reason that any flash of lightning in the immediate proximity of the outfit would be more likely to "jump" to its natural affinity, with which "X 37's" machine was charged, and leave a pretty effective illustration of "blazing a trail."

I do not know whether "X 37" gave enough consideration to, or knew enough about what he was writing; probably he thought more about the 40 m.p.h. "blind" through the watersplash. At any rate, I consider it my duty to do what I can to dispel *this* hallucination. To my mind, it is simply *begging* for trouble, and the sort of trouble that only happens once—certain death.

True, there is a great deal yet to be discovered as to the vagaries of lightning, but there are certain more or less rudimentary laws, which one should be in possession of, before rushing into print with statements, which are dangerous to thousands of motor cyclists who might be tempted to try the experiment. ALEC R. FRASER.

The Overseas Trial.

Sir,—Seeing there is so much comment on the Overseas trial of machines, I have submitted to you photographs showing the roads, or apologies for roads, which the machines have to face. COLMAR WOCKE.

Port Elizabeth, South Africa.

WITH A 3½ h.p. HUMBER IN SOUTH AFRICA.

Transporting the motor and sidecar across the stony bottomed Gamtoos Drift at Hankey.

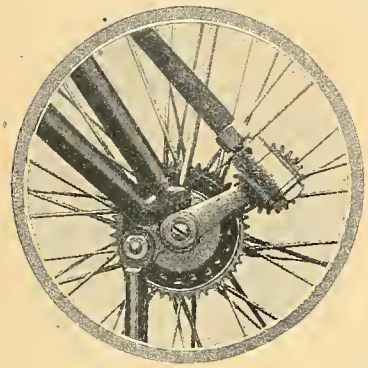
Scene on the road to Loerie. Roads which are more like ploughed fields than tracks to ride on.

Rear Lights.

Sir,—Replying to your correspondent, Mr. W. P. Cook, I can only say that the speed factor in these accidents is such an undeterminable matter that it is useless to argue on it. The point to consider is, that these fatal accidents have occurred and will occur again. It is for Mr. Cook to say whether splitting hairs on a point of law or the adoption of a sensible lighting regulation for all road traffic will lessen the risk of like accidents in future. A. B. BENNETT.

Speedometer Drives.

Sir,—With reference to "Ixion's" remarks in *The Motor Cycle re* fitting a speedometer. We have pleasure in enclosing you a photograph showing how the driving cog for Bonniksen speedometers is standardised on the Rudge motor cycle front hubs. There is no question of centralising in the lathe, for the cog-wheel is bored out to a fit for the hub flange and is then soldered in position.



RUDGE-WHITWORTH, LTD.

Marking System in the Scottish Trials.

Sir,—Unwilling as I am to enter into a newspaper correspondence, I feel I can barely allow "Ixion's" remarks, under this heading, to pass unchallenged.

Some of his statements are bound to lead to misconception, and the simplest way might be for me to explain the reason of the marking system adopted.

Since the inception of the Scottish Trials a gold medal has been given only to those who completed the course without loss of marks on time, and this must be counted as the chief factor in the allocation of gold medals. Any person who fails to come up to the requisite standard has failed in the main essential of the trial, viz., reliability.

This year, it is true, a subsidiary factor was introduced, namely, that competitors should climb a certain number of hills for which a certain number of marks were given, and the reason why an "Irishman's bonus," as "Ixion" rather aptly describes it, was deducted for the first loss of marks on time, was simply to avoid the possible case of where a silver medal winner might come to within one mark of the total possible, while a gold medal winner might have considerably fewer marks, or, paraphrasing the above sentence, the first loss of marks on time, which means the loss of a gold medal, was made sufficiently big to counteract any possible marks earned on hills.

Take the case where a competitor was one minute late and the penalty was only one mark, he would get 149 marks for reliability; he might climb all the hills which would give him forty-five marks, and he might lose no marks under the condition of machine heading, which would bring him out to a total of 194. A gold medal winner, on the other hand, would have to get 150 marks for reliability. He only requires to climb five hills, getting forty marks, making a total of 190, and he is allowed to lose fifteen marks under the Condition of Machine heading, and yet gain a gold medal, which would bring him out with a final figure of 175 as against the 194 marks got by the silver medal winner. Were the hill-climb marks allowed to be used as a set off against marks lost on reliability, it would be found that a machine would be able to get a gold medal on account of its hill-climbing capabilities even though it proved itself quite unreliable, and the purpose of the trial is to show a reliable machine, in the first instance, and in the second instance a good hill-climber.

I agree it is desirable that the public should have information regarding trials in as lucid and concise terms as possible, and I rather venture to think that the system of marking adopted in the Scottish Trials is adequate for this purpose. It may seem a hardship that a competitor should lose fifty-one marks for the first minute that he has lost on time, but it must be remembered that it is that minute which makes the difference between a gold medal and a silver medal, its value in marks varying according to the system of marking.

I must specially draw attention to the statement made by "Ixion," as follows: "The public will never realise that some unfortunate competitor who lost fifty-one marks in the Scottish Trials was guilty of no worse crime than being a minute early at a control, owing possibly to a discrepancy between watches, which the judges may refuse to admit on appeal."

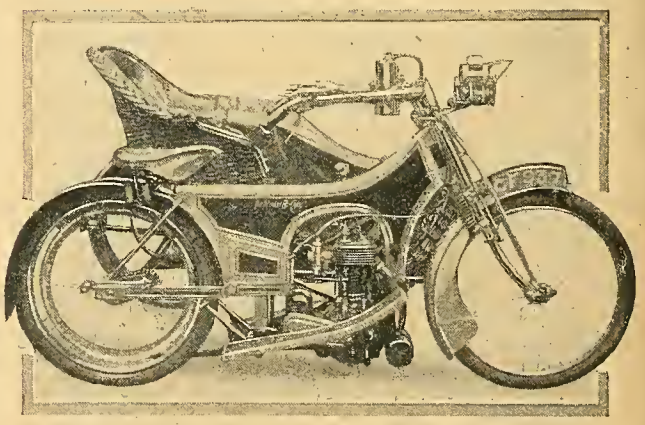
This is a totally misleading statement, from which it might be gathered that if a man arrives in a minute before or after a certain time he loses fifty-one marks; that is, in effect, that competitors must practically adopt what is known as the split second method of time. This is erroneous, and "Ixion" knows perfectly well, or ought to know, that there is a ten minute margin at each section, and provided a competitor comes in at any time within this ten minutes he loses no marks, which is a very different state of affairs from what the casual reader would gather from the above quotation. Incidentally, no competitor lost marks through being early.

The element of luck always enters into a trial, and I believe it is easier for a good man with a poor machine in any trial than it is for a poor man with a good machine to win a gold medal. Some people go the length of saying that 80% depends upon the rider and 20% on the machine, and in the cases "Ixion" cites it may have been a matter of luck that a loss of marks has been entailed. It may have been no fault of the machine and it may be no fault of the man, but the fact remains that marks on time have been lost, and that an adequate deduction from the total possible must be made for such loss so as to differentiate between those who have come up to the requisite standard and those who have not. CAMPBELL McGREGOR.

Pressed Steel Frames for Motor Cycles.

Sir,—Your article in the July 9th issue of your excellent journal to my mind strikes the keynote to future constructive principles for motor cycles. For two years I have used a pressed steel frame. Not only are all "brazing weaknesses eliminated, crystallisation of the tubes practically banished, and weight saved," but owing to the absence of tubes and lugs, which create inaccessible crevices, the machine can be cleaned by merely wiping the flat surfaces with a soft cloth.

The machine, of which I enclose a photograph, is built up with a special channel steel girder frame, and, judging from my immunity from fractures, which are continually occurring to tubular patterns, should be, and undoubtedly is, far stronger, of no greater weight, and decidedly neater in appearance.



The Midget Bicar mentioned in letter from J. H. Newson anent pressed frames.

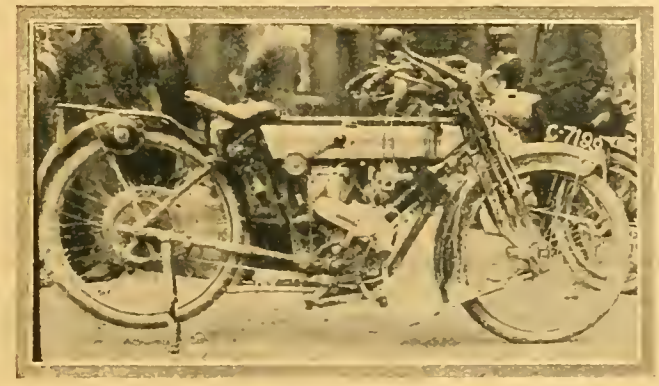
During the past two seasons I have run through the Midlands, and the machine has created quite a surprise and been most favourably commented upon. I am looking forward to the time when the petrol and oil tank of to-day will give place, as also, without doubt, will tubes and lugs, to the pressed steel frame and tank, a most serviceable combination, though at present little known.

J. HENRY NEWSON

Round the "Six Days" Course on a P. and M.

THERE has lately been a good deal of talk on the subject of "delivery tune," many wails having reached *The Motor Cycle* on the slip-shod manner in which some machines are turned out by makers. This, of course, is not as it should be, but the complaint does not apply to manufacturers generally, as the following will prove.

Our own vehicle not being geared low enough for freakish hills, we accepted the offer of Messrs. Phelon and Moore of a motor bicycle for the A.C.U. Six Days Trials. This machine was delivered by the Cleckheaton Works to Sheffield, and it was not until the day preceding the start of the trial that we saw the mount we were to ride. An inspection of the toolbags and general equipment of the machine revealed the fact that the P. and M. was turned out thoroughly in every detail. The severity of the Six Days Trials is now a matter of common knowledge, and even on the first fifty miles of the route when it rained smartly the mettle of the P. and M. was tested to the full, for on the moorland roads and grass-grown track we were constantly bumped out of the saddle, and it was soon clear that the rider would be the first to give out under such conditions. The trial has been described as "a test to destruction," but the numerous hills proved no match for the P. and M., though it is true we were stopped near the top of Littonstack when going well, due to a sidecar which failed and blocked the whole of the road. However, by a dig at the kick starter and pulling the low gear gently into engagement the machine was made to do the remainder of the donkey work under its own power.



The P. and M. machine we used, photographed as it finished the Six Days Trials.

A High Average.

A twenty miles an hour average over this year's Six Days Trials course has been stated to be next to impossible, but a good many critics who have attacked the trials organisers probably saw very little of the trial itself, but gained most of their impressions from those crestfallen competitors who dropped out. The P. and M. which we rode not only averaged its twenty miles, but more; indeed, it was absolutely necessary for us to do so to gain any true idea of the daily conditions and tests which the men had to undergo. After observing on one hill it was our practice to scurry ahead to the next, and that was where a fleet machine able to take every hill in its stride proved a boon. Two years ago we rode a P. and M. in the Six Days Trials; that was during the memorable week with Taunton as a centre, when Porlock proved the *pièce de résistance* on the last day, and it was the pleasant memories of the way our mount tackled the Somersetshire terror that led us to ride a P. and M. this year. Once again we are happy to state that our trusty mount successfully ascended every hill we encountered, Green Hill, Wirksworth, Jacob's Ladder, Cowdale, Trooper's Lane, Stoney Middleton, Scapegoat, Curbar, and many other curious sounding titles included. We consider that its best climb was up Lea Lane, in Shibden Dale. This hill, it will be remembered, was the one across which were deep gulleys and the surface smothered with large loose stones. Riding was certainly not a pleasure, for one required the agility of a cat to keep in the saddle, but the P. and M. as regularly as ever plodded its way up the hill, picking up again immediately after each gulley, in the crossing of which we found it necessary to raise the valve lifter. Few who did not see the trial can appreciate the difficulties and the strenuous nature of the course. The boulder-strewn surfaces, grass-grown cart tracks, constant hairpins on the roughest of hills, told their tale in weeding out sixty-seven of the hundred and thirty-two competitors, and those machines which did finish in most cases bore distinct traces of the trial they had undergone. Our P. and M. finished its six hundred miles gruelling in magnificent condition, not a nut being loose, and the rims were undented. The spring forks certainly squeaked slightly at times and often bumped on their stops due to the springs being compressed to the limit, but throughout the week the sum total of trouble was a puncture in the driving wheel on the third day and a brake bolt disappearing on the last day. As a matter of fact, we were not aware that the bolt connecting the band brake had disappeared, and did not discover it until descending a steep hill rather hurriedly when it was touch and go whether we could scrape round a corner. This incident was pointed out to the makers of the machine, but our words have not fallen on waste ground, for with characteristic enterprise Messrs. Phelon and Moore inform us that in future they intend to fit all such bolts with nuts and split pins.

As regards attention to the machine, this, shame to relate, had perforce to be cut down to a minimum, for after a long day's tiring ride dinner is tempting, and afterwards "copy" to catch the outgoing mail leaves little chance for attention to one's mount. But this is where the P. and M. excelled, for, despite the scant attention, it responded every morning to our beck and call, and it is not guilty of any whims or idiosyncrasies.

In speed the P. and M. is well able to hold its own with the majority of 3½ h.p. mounts, and will touch nearly fifty miles an hour. The petrol consumption was in the neighbourhood of 70 m.p.g., due to constant low gear work, but in oil consumption it is distinctly economical. G.S.

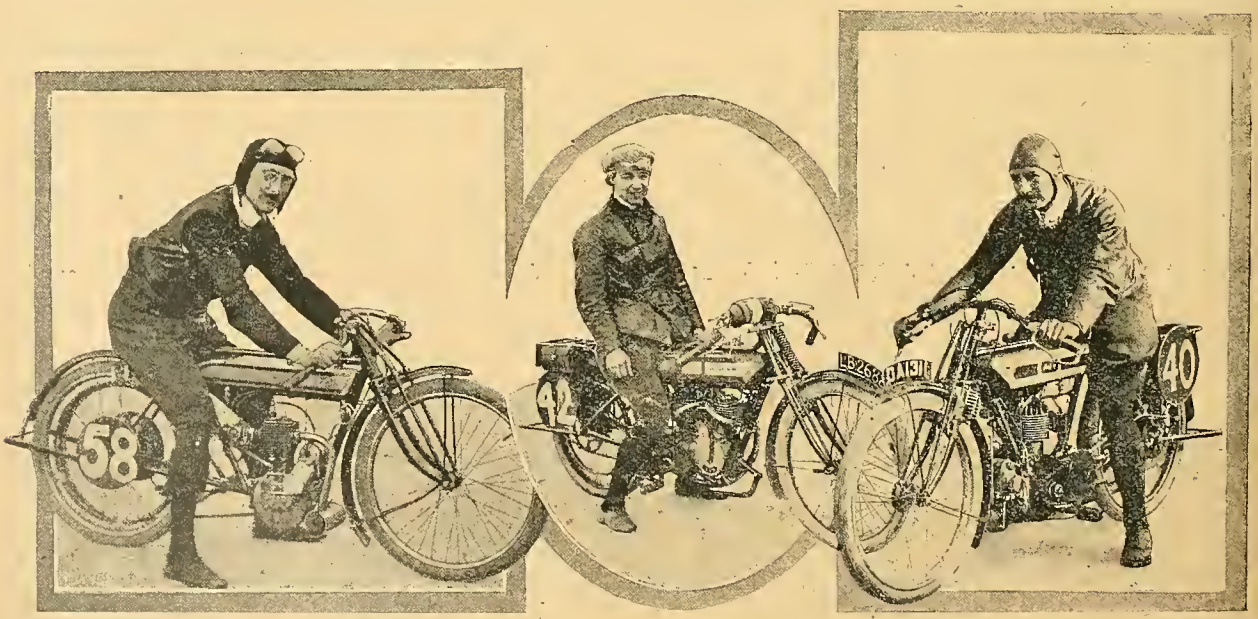
M.C.C. SIXTH ANNUAL RACE MEETING.

Competitors just past the starting line in the handicap cycle car event. In the foreground may be seen E. B. Ware (Morgan monocar), the ultimate winner, and F. White, who is driving a similar make of machine.

QUITE a large crowd was gathered together on Saturday last, at Brooklands, to witness the races organised by the Motor Cycling Club. Entries also were not lacking, but at the same time the number of riders in each race was not so large as to be unwieldy. Everybody who attends many race meetings or competitions knows how dull it is if long intervals separate each event. In this case, however, there was no such trouble, and everything went off without a hitch from the start of the first race to the prize distribution, which was performed by Mr. Charles Jarrott. In the first race G. Fletcher was the only entrant who failed to put in an appearance at the starting line. W. A. Jacobs (Singer), who was the first man to start, led for the whole of the three laps, and finished an easy winner. The A.J.S., which was in wonderful tune, was driven from scratch into second position by B. Haddock. Another Singer machine, ridden by J. P. Le Grand, had tyre trouble, but managed to start, although in the second lap the belt came off.

In the second race several competitors failed to put in an appearance. D. R. O'Donovan, who set up new records on a Norton on Friday, being a notable absentee. P. Shaw (3½ P. and M.) led in the first lap, followed closely by H. le Vack (3½ Motosacoche), who subsequently proved to be the winner, L. Mogridge (3½ Rudge), R. Charlesworth (3½ Motosacoche), and D. H. Noble (3½ Rover). Le Vack took the lead in the second lap and maintained this position to the end. An Indian won the third event and was piloted by S. F. Garrett. Whilst A. H. Hewitt was on his second lap it was noticed that his exhaust pipe had come adrift and was trailing on the ground. Plug trouble was also responsible for the retirement of S. R. Axford (Zenith).

A two lap race for machines with engines not exceeding 350 c.c. comprised the fourth event, which was won in fine style by B. Haddock (A.J.S.). G. Fletcher (Douglas) dropped out without completing a lap. C. R. Collier (Matchless) won the fifth race, which attracted a large number of riders. All the competitors started together and used machines with engines not exceeding 560 c.c. D. R. O'Donovan (Norton) would have won easily if his belt had not stretched, for he completed a lap at 70 m.p.h



SOME OF THE CLASS WINNERS AT BROOKLANDS ON SATURDAY.

(1) W. A. Jacobs (2½ h.p. Singer), winner of the 350 c.c. class.

(2) H. le Vack (Motosacoche), who won the second race for motor cycles between 350 c.c. and 560 c.c.

(3) B. Haddock (2¾ h.p. A.J.S.), winner of the fourth race.

Still Another Success.

GOLD MEDAL

FOR THE

CAMPION

IN THE

A.C.U. 6 DAYS TRIAL

Motor cycle and sidecar class (concluded July 11th), the highest award

GOLD MEDAL

was won by the all-conquering

CAMPION

ONLY ONE CAMPION ENTERED AND SECURED GOLD MEDAL.

However much more you may pay (and you can pay considerably more), you cannot get a more reliable motor cycle than the CAMPION, which is made in a model factory, by the most skilful mechanics in the trade.

Campion Motor Works

NOTTINGHAM.

The SINGER Smile

is born of "Singer certainty"—the certainty that banishes all thoughts of worry and makes the Singer ride entirely free of care.

Typical of the care-free Singer rider is the illustration reproduced below, the original of which is kindly sent us by J. D. Forbes, Esq., of Dundee, who says:—

"Here is an interesting picture—you can use it in any way you like. The bicycle portrayed I purchased about a year ago and it has gone nearly 3,000 miles without a semblance of Engine trouble.

No wonder that the owner's confidence is reflected in the youngsters' faces!

"The Singer Smile"—we should like to see you wearing it and sharing that perfect satisfaction which is responsible therefor.

Let us send you Booklet.

SINGER & CO., LTD., COVENTRY —17, HOLBORN VIADUCT, LONDON.

Ariel

DUAL SUCCESS

English Six Days Trial.

THREE GOLD MEDALS

AND

Two Silver Medals

The Motor Cycle, 9/7/14.

"The most remarkable performances were those of the three 3½ h.p. Sidecar outfits still left in the trial, viz., Watson's 3½ h.p. Ariel, etc."

English Six Days Trial, 1913.
TEAM PRIZE—
THREE GOLD MEDALS.

Scottish Six Days Trial.

FOUR GOLD MEDALS

AND

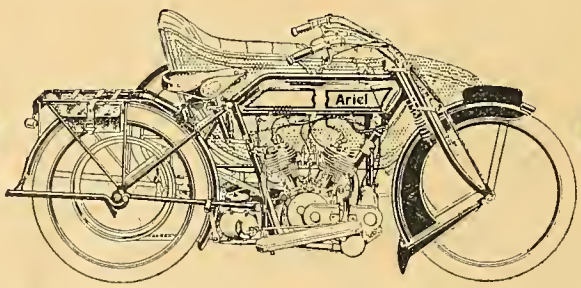
One Silver Medal

The Scottish Cyclist, 24/6/14.

AMULREE HILL—"Accounted for a good many failures. The Ariels all made a good show."

Scottish Six Days Trial, 1913.
TEAM PRIZE—
FIVE GOLD MEDALS.

ARIEL WORKS (Dept. A), BOURNBROOK, BIRMINGHAM



Start of the three lap multi-cylinder sidecar event, won by O. de Lissa (6 h.p. Motosacoche), who is seen on the timekeeper's right.

Exciting Finishes.

The next event was another win for S. F. Garrett on an Indian, though it is doubtful if he would have won if C. R. Collier had not been troubled with misfiring in one cylinder. S. A. Rowlandson (T.T. Rudge) put up a fine speed in the sidecar handicap, averaging over 50 m.p.h. from a standing start, and was followed home by Haddock's little A.J.S. All the machines in this event were fitted with single-cylinder power units. Another contest for sidecars followed for motor cycles with multi-cylinder engines over a distance of three laps. O. de Lissa (6 Motosacoche-M.A.G.) took the lead from the beginning and won easily. Event 9 was by far the most exciting race of the day and provided an extremely close finish. It was a light car handicap race and was just won by E. B. Ware on a Morgan monocar. A. Mariani (Tweenie) was second, and Lionel Martin (Singer) came home third from scratch, his average speed being 77.1 m.p.h.

In the event, No. 11, for the "Harry Smith" gold challenge cup, a splendid finish took place, and resulted in a win for C. R. Collier (Matchless), followed by B. Haddock (A.J.S.) and H. le Vack (Motosacoche). The invitation club despatch race was won by the Woolwich and Plumstead M.C.C., whose team consisted of H. Collier, C. R. Collier, H. V. Colver (Matchlesses) and F. J. Ellis (2¾ Enfield).

FORTHCOMING OPEN EVENTS.

Open Speed Contest at St. Andrews.

The Leven and East Fife M.C.C. will hold a series of speed contests at St. Andrews on the 30th inst., commencing at 1.30 p.m. There will be sixteen classes, the limit capacities being 350, 560, and 1,000 c.c. for motor cycles, and 600 and 1,000 c.c. for sidecars. Entries at increased fee will be received by Mr. A. H. Adamson, Glebefield, Leven, Fife, until the last post on Saturday, the 25th inst.

Liverpool-London-Liverpool.

An A.C.U. permit has been applied for by the Liverpool A.C.C. to hold an open trial from Liverpool to London and back on August 14th and 15th. It is proposed to allow competitors to start from Liverpool, London, or the Stonebridge Hotel on the Coventry-Birmingham road. This is said to be the first trial of its kind. Application should be made to Mr. E. F. Baxter, hon. sec., 5, Blantyre Road, Sefton Park, Liverpool.

Amateur Open Trial.

The Liverpool Amateur M.C.C. held an open trial for amateurs only on Saturday last over a sporting course in Cheshire, Staffordshire, and Derbyshire. The route was *via* Knutsford, Macclesfield, Swythamley Hill (observed), Buxton (lunch), Cowdale, Congleton, and Mow Cop. There were twenty-five starters. Of these three failed on Swythamley Hill and six on Cowdale, A. Kilgour (3½ Brough) and T. Carr (6 New Imperial) retired with broken sprocket and frame respectively. Every competitor who qualified for an award climbed Mow Cop without a stop. The surface of Swythamley Hill was very greasy after the recent rain, and Cowdale much cut up and loose, in consequence of the recent A.C.U. Six Days Trial.

We think a trial of this kind worthy of support from amateur riders.

The following are the awards subject to confirmation:

GOLD MEDALS.

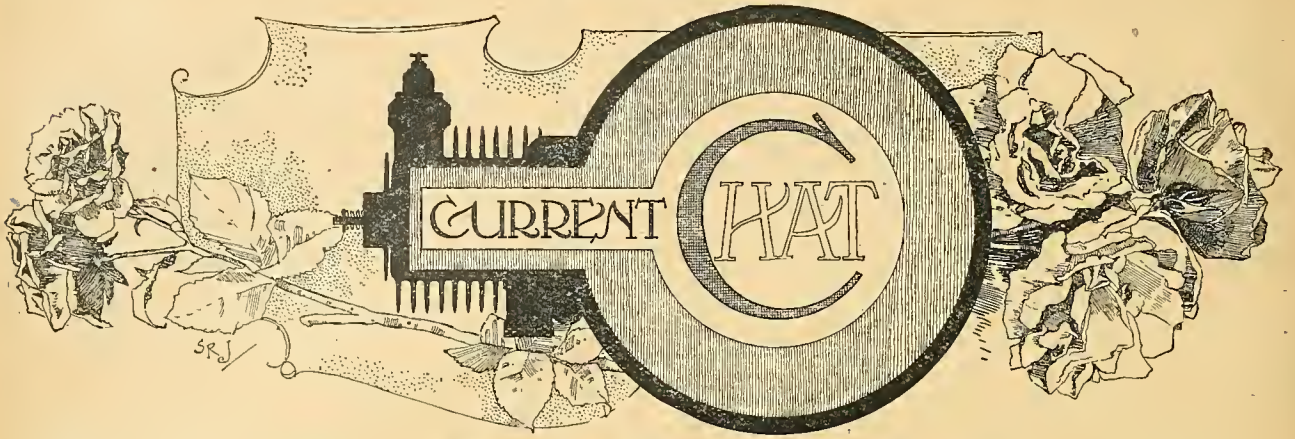
S. Howard 3½ Bradbury)	S. E. O'Hanlon (4 Triumph)
H. W. Hardwick (3½ Rudge)	D. Cole (3½ B.S.A.)
W. Hardwick 3½ Rudge)	H. D. Ashworth (4 Triumph)
H. R. Lane (8 Rex-Jap)	

SILVER MEDALS.

E. S. Taylor (7 Matchless)	A. J. Fryer (5 Rudge)
H. Barnes (8 Matchless)	

No team finished complete.

Two aspects of the last steep portion of Mow Cop, showing competitors in the Liverpool Amateur M.C.C. trial, on Saturday, nearing the summit.



TIMES TO LIGHT LAMPS.

July 26	... ...	9.0 p.m.
,, 25	... ...	8.58 p.m.
,, 27	... ...	8.55 p.m.
,, 29	... ...	8.52 p.m.

Police Trap.

We have received information of a police trap in the Avenue on the south-west side of Clapham Common.

A Belated Award.

We learn from J. Haslam that, after further consideration of his marks, the A.C.U. have awarded him a bronze medal for his performance in piloting a 3½ h.p. Premier sidecar round the A.C.U. Six Days Trials.

Exclusive News.

A two-stroke Singer will shortly make its appearance. It will have an engine of 2¾ h.p. and counter-shaft gear.

A 5 h.p. twin-cylinder Indian will be added to the Hendee range for 1915. The engine, frame, and general design will be much on the lines of the 500 c.c. Indian which ran so well in this year's Senior T.T.

Stanley is said to have got a Triumph which will attain a speed of 75 m.p.h., but is not satisfied yet.

A new horizontal twin, the production of a large firm of Midland manufacturers, will shortly make its appearance.

A Morgan with an M.A.G. engine of 1,100 c.c. has been seen under test on the road.

A Morgan four-wheeler is a possibility of the future. Such a machine has been on the road some time, but Mr. Morgan has decided not to market it next year, at any rate.

A twin-cylinder two-stroke motor cycle engine, with the cylinders set in tandem, is nearing completion in a Midland factory.

Two well-known makers of twin-cylinder cycle cars will adopt four-cylinder engines as standard in 1915.

The Scott Co will shortly introduce a lightweight two-stroke.

Two important firms, new to counter-shaft gears, have experimental models on the road, viz., the Rover and Hazlewood. Both gears are of the three-speed variety.

A Precision two-stroke engine may be expected before long.

It is considered by a reliable authority that a new and compact magneto-dynamo machine, which has just been completed, will revolutionise the lighting of motor-cycles next year.

The Buyers' Guide.

The two-stroke and lightweight buyers' guide which we publish in this issue contains particulars of no less than 37 two-stroke machines at present on the market, and advance details of one which will shortly be introduced.

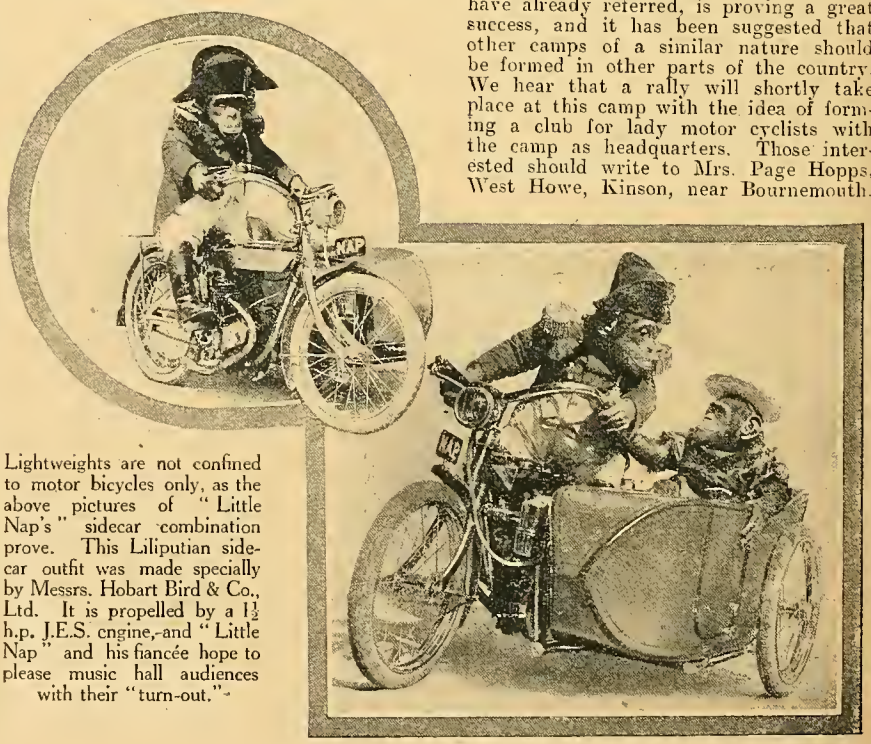
A Motor Cycle as Prize.

The first prize in the drawing held in aid of the Warrington Charities will be a new 3½ h.p. James motor cycle, twin-cylinder, three-speed, free engine clutch, and chain drive, value sixty guineas.

North Wales Championship.

The championship of North Wales in connection with the Mersey M.C. Colwyn Bay speed trials was won by J. H. Fox (5 h.p. Matchless sc.) for the second year in succession.

The championship was open to riders of any type of vehicle, and was therefore run on handicap. R. F. James (3½ h.p. N.S.U.) accomplished fastest time.



Lightweights are not confined to motor bicycles only, as the above pictures of "Little Nap's" sidecar combination prove. This Liliputian sidecar outfit was made specially by Messrs. Hobart Bird & Co., Ltd. It is propelled by a 1½ h.p. J.E.S. engine, and "Little Nap" and his fiancée hope to please music hall audiences with their "turn-out."

SPECIAL FEATURES.

ILLUSTRATIONS AND SPECIFICATIONS OF 55 TWO-STROKE AND LIGHTWEIGHT MACHINES.

THE ACTION OF A TWO-STROKE ENGINE ILLUSTRATED BY DIAGRAMS.

12 YEARS OF LIGHTWEIGHT DESIGN.

The Handicap on Two-strokes.

In September, 1909, we suggested that the handicap on two-strokes (it will be remembered that under the old regulations of the A.C.U. the capacity of a two-stroke engine was multiplied by 1.25, or, if it was water-cooled, by 1.32) should be removed, and that machines of both types should compete on equal terms. This was subsequently done, and has undoubtedly had a considerable effect in the perfecting of the two-stroke engine.

The Motor Cyclists' Camp.

The motor cyclists' camp at West Howe, near Bournemouth, to which we have already referred, is proving a great success, and it has been suggested that other camps of a similar nature should be formed in other parts of the country. We hear that a rally will shortly take place at this camp with the idea of forming a club for lady motor cyclists with the camp as headquarters. Those interested should write to Mrs. Page Hopps, West Howe, Kinson, near Bournemouth.

Cycle Car Trial Postponed.

The cycle car and light car trial arranged by the Coventry and Warwickshire M.C. for Saturday next has been postponed owing to the sparse entry received.

Registration Marks.

The County of London has added yet another index mark to the already long list in use, namely, L.M.

The County of Essex will in future use the letters HK, in addition to F.

International Six Days Trial.

Only three countries have so far entered for the Motor Cycle Manufacturers' Union 200 guinea international trophy, which will be competed for in conjunction with the Six Days Trial from Grenoble, August 3rd to 9th next. The entries so far received for this event total about 70.

An Incident of the Six Days Trial.

We have the assurance of P. Platt that he had not the slightest trouble with his 6 h.p. Bradbury engine in the Six Days Trials, so that the reference in our report to a senzure must have been due to confusion in the competitors' numbers, which were usually very dusty and dirty toward the end of the day.

What to do in a Thunderstorm.

Some interesting information is to be found in our correspondence columns this week respecting the best course to take if caught in a thunderstorm. No danger need be apprehended from a storm at a distance of more than a mile; sound travels at about 1,140 feet per second; therefore, if the flash is seen four or five seconds before the thunder is heard no notice need be taken. It is unwise to shelter under trees, though a tree at a short distance is a protection rather than otherwise, and it is advisable to stand clear of the machine. Finally, if overtaken by a storm in open country, the safest but wettest plan is to lie prone upon the ground.

A.A. and M.U. Notes.

The annual meeting of the Automobile Association was held on July 15th at the Hotel Cecil, London. Mr. W. Joynson-Hicks, M.P., the Chairman of the A.A. and M.U. Committee, presided.

In presenting the annual report, Mr. Joynson-Hicks stated that they could congratulate themselves upon the extraordinary growth of the Association.

He had asked the secretary to get out figures for a week's work of the Automobile Association, and the return before him was for the week ending July 11, and among interesting items in that return were: New members, 936; letters received, 13,119; letters sent out, 20,999; summonses defended, 135. 14,247 members were warned by the A.A. road patrols in the interests of themselves and all road users. 1,006 routes were supplied to members proposing to tour at home or abroad, and 1,307 members received plans showing the best way through towns.

Four retiring members of the Committee, Mr. S. F. Edge, Mr. John Kennedy, Mr. Charles McWhirter, and Mr. P. A. Sharman, retired in accordance with the rules governing the Association, and offered themselves for re-election. They were unanimously re-elected, as also were the auditors, Messrs. Newson-Smith, Lord, and Mundy.

FUTURE EVENTS.

—o—

July 25.—Streatham and District M.C.C. Open Hill-climb.
" 25.—B.M.C.R.C. Race Meeting.
" 25.—Dublin and District M.C.C. Open Race Meeting at Portmarnock.
Aug. 3-9.—F.I.C.M. INTERNATIONAL SIX DAYS TRIALS. Grenoble as a centre.
" 14-15.—Liverpool A.C.C. Open Trial to London and Back
" 15.—French Grand Prix Motor Cycle Race near Le Mans.
" 15.—Essex M.C. Race Meeting at Brooklands.
Sept 6-9.—ANGLO DUTCH TRIAL IN HOLLAND
Nov. 23-28.—Motor Cycle and Cycle Car Show at Olympia.

Competitions in New Zealand.

In a recent sidecar trial held by the North Canterbury Motor Cyclists' Club there were twenty-six entries. Several well-known makes of motor cycles turned out, and, in spite of a fairly hilly course, eighteen finished. The first three places were taken by: H. Jones (6-7 h.p. King Dick), A. B. L. Smith (5-6 h.p. Clyno), and J. Michael (4 h.p. Triumph).

A.C.U. Notes.

INTERNATIONAL CYCLE CAR RACE.—The following are the entries which have been received for the International Cycle Car Race to be held in the Isle of Man on September 24th next. Intending entrants should note that entries close at ordinary fees on the 29th inst.

RIDER AND MACHINE.

H. Alexander (10 Calthorpe Minor).
A. Alexander (10 Calthorpe Minor).
F. Burgess (10 Calthorpe Minor).
T. V. West (10 Calthorpe Minor).
Trevor Roscoe (10 Morris-Oxford).
Thos. B. Andre (8-10 Marlborough).
Gerald T. Mayne (10 Calthorpe Minor).
Vernon Busby (8 Morgan).
Marcel Violet (6 Violet-Bogey).
W. Douglas Hawkes (10 Victor Precision.
——— (10 Victor Precision).

T. Stevens (James), who was the only single-cylinder sidecar driver to gain an award in the Six Days Trials, "tacking" across a gully on Don Hill, Stocksbridge

Week-end Speed Trials.

Since our "Club News" page went to press a telegram reached us from the Sheffield and Hallamshire M.C.C. asking us to withhold their speed trials results as an error had been discovered in one of the timekeeper's watches.

Should Trials Courses be Severe?

The Yorkshire press does not look with favour on the "fuss," as they call it, which is being made in connection with the Six Days Trials course. The *Sports Special* of Sheffield quotes extracts from our leading article of last week concerning the number of gold medal winners.

Streatham Open Hill-climb.

A large number of entries have been received for the open hill-climb of the Streatham Club, which will take place on the Straight Hill at South Harting next Saturday. There are twenty classes.

The Twin P. and M. in this Issue.

Following upon our exclusive descriptions of the new Lea-Francis sidecar combination, the new 7 h.p. twin Rudge, and numerous two-stroke lightweight machines, we are able to publish this week the first illustrated description of the new 6 h.p. 90° twin P. and M., which is to have four speeds.

The International Trial.

An interesting entry for the F.I.C.M. Trials, with Grenoble as a centre, from August 3rd to 9th, is that of Maurice Greenwood, of Todmorden, with a 2½ h.p. two-stroke Connaught.

Another two-stroke rider in the International Six Days Trials will be A. G. Fenn, who is to be mounted on a 2¾ h.p. Levis, with Enfield two-speed gear.

A late entry was received from R. G. Parker, who, it will be remembered, successfully rode a Norton in the Paris-Nice Trial. This time he will be mounted on a Triumph machine.

Main Contents of this Issue.

This special issue, which is greatly enlarged, in addition to the usual features, contains an article by G. D. Abraham on hill-climbing in Cumberland, entitled:

"What Lightweights can do in Lakeland." Page 106.

"Why I Favoured the Two-stroke Engine," by A. A. Scott. Page 111.

"Where a Lightweight Scores," by B. H. Davies. Page 109.

An illustrated Buyers' Guide of fifty-five two-stroke and lightweight machines. Pages 131-142.

"The Action of a Two-stroke Engine," with diagrams. Page 104.

"Through Feminine Goggles," by Miss May Walker. Page 102.

"The Progress of Lightweights from Year to Year (1903—1910)." Page 125.

"New P. and M. 6 h.p. Twin-cylinder." Page 122.

"Round the Six Days Course." Page 117.

The different week-end events are also described and illustrated as usual.

Police Traps.

We are informed that a police trap is being worked between Padbury and Buckingham on the Buckingham-Winslow road, and there are rumours of another on the Buckingham-Aynho road at Finmere, about four miles from Buckingham.

THE INTERNATIONAL SIX DAYS TRIAL.

About 70 Entries and 3 International Teams: Great Britain, France, and Switzerland.

THANKS to the supineness of the Union Motocycliste de France, we are still unable to give anything like a complete list of entries. These closed at ordinary fees on the 11th inst., and all that has been sent to us by the French governing body is a list of manufacturers and private owners who have entered. No mention is made of the machines, and the list is certainly not complete, as many names of drivers are missing. Entries finally close at double fees next Saturday. It will be noticed that of the sixty-four names given in the appended list twenty-seven, or nearly half, are English. Up to the present only three International teams have been entered for the Motor Cycle Manufacturers' Union 200-guinea trophy.

Owing to the French body having kept the A.C.U. in ignorance of the names of the English entrants up to the eleventh hour, the latter institution will find it difficult to make satisfactory travelling arrangements. But those English riders whose names are given herewith are being circularised by the Union, and those who are travelling by road will, through the courtesy of the R.A.C., receive a route to Grenoble, made out with the clearness and accuracy for which its touring department is famous, while a car bearing two officials of the F.I.C.M. will leave Havre about 8.30 on the morning of the 30th inst. for Grenoble, and those who require a pilot may follow it. It must be distinctly understood, however, that as it is urgent for the occupants to arrive in Grenoble as early as possible, the car cannot wait for any who drop behind, and the suggestion has been made by *The Motor Cycle* merely to help those who care to take advantage of the offer. All who travel by road should take a French Michelin Guide with them to aid them in selecting hotels on the route.

SWISS INTERNATIONAL TEAM.

Progin (350 c.c. Motosacoche)	Lavanchy (500 c.c. Motosacoche)
Gex (350 c.c. Motosacoche)	

FRENCH INTERNATIONAL TEAM.

—— (Baby Peugeot)	—— (Bedelia)
—— (Baby Peugeot)	

The names in italics indicate the English team, and those marked with an asterisk, while they do not appear on the official list, have either sent their entries to the U.M.F. or have signified their intention of so doing.

Entries definitely close at double fees on Saturday next. The trial is from August 3rd to 9th, the total distance being 981 miles.

IRISH END-TO-END NOTES.

(A description of the run will be found on page 126b).

One of the weaknesses of the regulations of the Irish End-to-end Trial was that while it was possible for a man who was an hour late to obtain an award, if a rider was found to be a few seconds in advance of the ten minutes allowed on the maximum scheduled time he was disqualified. At the secret check at Tipperary quite a number of men were caught in this way. Hugh Gibson was amongst the number, and F. L. Dooley. The latter, believing it was useless to go on, retired at Dublin, but Gibson proceeded. Complaints were made by several of the men that all the riders were not checked at the same place. As Gibson's margin of error was only ten seconds, it will be readily seen that a few yards either way might account for it.

One of the most severe parts of the course was the observed hill near Kenmare. It is on the old road from Kenmare to Killarney, and proved a very much more severe ascent than the Ballaghabeama Pass. The gradient was steeper, and the surface was quite as rough. The nearest approach to it was the "staircase" in the Six Days Trial.

The first day's run was somewhat marred by accidents, which put an end to the chance of de la Hay, the Sunbeam rider, and Clancy (2¾ h.p. Douglas). Both came to grief at the same spot, but one was not in any way responsible for the accident of the other. De la Hay came round a sharp bend of the road at a very fast pace, and, finding the corner blocked by some riders in front, he took to the grass on the inside without observing that it concealed a very deep gulley. He got a nasty fall, and his machine was too much injured to permit him to continue. Clancy came to grief in a somewhat similar way at the same place. Wilhelmj, who was following on a sidecar machine, in a very sportsmanlike manner took both the riders back to Killarney, where they received medical attention, and were able to proceed to Dublin by train. Wilhelmj was very late at the Limerick control in consequence, but doubtless he will not be penalised for his sportsmanlike action.

"Sou'-Wester" (2¾ h.p. Douglas), who, by the way, will be a competitor in the Grenoble Trials next month, was very unlucky with tyres. He put in no less than four new tubes on the first day.

J. Parkes (6 h.p. New Hudson sc.) had a peculiar experience. In going over a culvert he caused the partition between the petrol and oil departments of his tank to come adrift, and the contents got mixed. It did not interfere with his running, but he was thirty-four minutes late in arriving in Dublin, being unable to make up the time which he lost in the earlier part of the day.

Out of thirty-nine starters only one rider used a single-geared machine. This was J. F. A. Day, on a 2½ h.p. Sun-Villiers. It will be recalled that the same rider used a single-geared machine in the recent Irish twenty-four hours, and succeeded in winning an award.

Ballaghabeama Pass did not prove by any means as severe a test as was anticipated. In fact, but for the roughness of the surface it would have given little trouble, even to the sidecar drivers. Under normal conditions the scenery in the neighbourhood is strikingly beautiful, but we feel that few riders in the trial were able to appreciate this aspect of the district, as the ascent of the pass was made by most of the men in a steady downpour of rain.

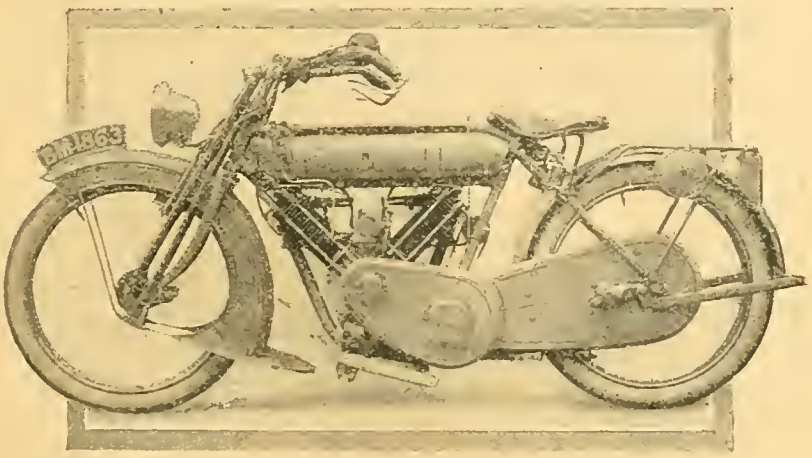
A NEW 750 c.c. TWIN P. & M.

Entirely New Design, embodying a 90° Engine of 6 h.p., Four-speed Gear, and Automatic Carburetter.

RUMOURS of a twin P. and M. have been prevalent for some time, and it was recently our good fortune to have an opportunity of inspecting one of these interesting machines at the premises of Messrs. Phelon and Moore, Ltd., 4, Percy Street, Tottenham Court Road, W.C. It will be seen from the accompanying photograph that the 90° twin engine is very neatly stowed away in the frame. The front cylinder assumes the position taken up by the cylinder in the case of the single, while the rear one is similar but not quite the same as the other, and is not interchangeable with it.

Two interesting features of the engine are the method of driving the magneto and the exhaust valve lifter. The former is brought about by a bevel formed on the back of one of the two to one gear wheels which transmits the power through a shaft to skew gearing on the magneto. The drive is silent and effective, and is easily accessible, as will be seen from the accompanying photograph, which shows the case with hinged lid for protecting the mechanism. With regard to the exhaust valve lifter, on the end of the shaft is a toothed wheel meshing with teeth cut on part of the periphery of two cam wheels. When the lever is pulled over, the cams are raised and come into action with the valve raising levers. It is interesting to note that all the tappets are fitted with rollers.

The bore of the engine is 76 mm., and the stroke is 82 mm., giving a c.c. of 750, and the engine is called 6 h.p. Oil is delivered to the front cylinder, and as the space between the baffle plates in the back is larger than that in the front, the back cylinder gets plenty of oil. The tank holds two gallons, is well designed, and looks by no means too large for the machine. The ordinary form of P. and M. two-speed gear is fitted, but a four-speed gear is in preparation, which consists of an ordinary P. and M. two-speed gear and a two-speed dog clutch gear box fixed to the bottom bracket—an ingenious and simple arrangement which should work admirably.



Transmission side of the new twin-cylinder 6 h.p. P. and M., showing position of magneto, and cylinders set at 90°.

The engine is arranged in the same way as a single, so that it can be swung forward and the cylinders removed.

Messrs. Phelon and Moore have been studying the question of a twin for a good many years, and they have now succeeded in bringing out a handsome and thoroughly practical article. It has not, however, quite reached its final stages, though only a few detail improvements have to be added. The carburetter is the Claudel-Hobson, which gives an ample amount of flexibility to the smooth running engine, but we understand that a different type will be fitted as a standard. Other P. and M. features, such as the front fork, chain cases, kick starter, brakes, etc., have been retained practically without alteration.

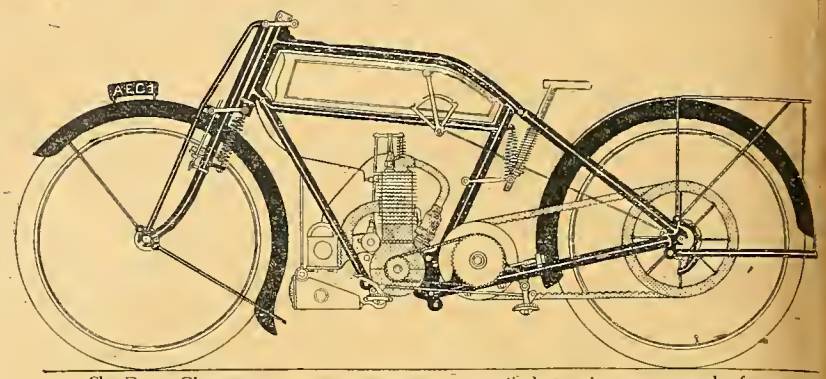
Worm drive to the magneto on the new P. and M.

A Twin Two-stroke with Four Valves.

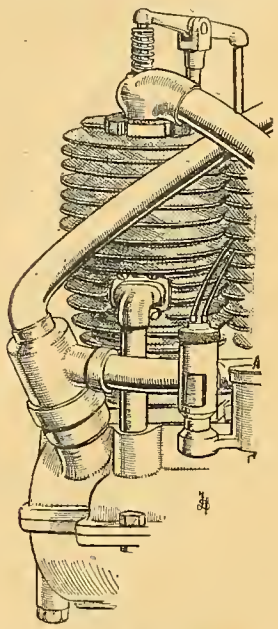
An Interesting Combination of Valve Principles.

THERE is under construction, in Coventry, at the present time a most interesting two-stroke motor cycle. The designer, Mr. Every-Clayton, of St. Mary's Villa, Hanley Swan, Worcester, is working on a somewhat unusual principle, for, combined with the usual two-stroke principle, there is a rotary valve and a mechanical inlet valve to each cylinder. It is anticipated that the greatly improved results will more than counter-balance the increased complication. The cylinders are both vertical and are set across the frame, the cranks being set at 180°. The mixture is drawn into each crank case through a rotary distributer valve, and a certain amount is transferred in the usual way through a comparatively small diameter pipe. The main charge, however, is transferred from the opposite crank case through the distributer valve, and finally passes through a mechanically operated inlet valve in the head of the cylinder. The exhaust ports are arranged in the usual manner. The arrangement of the double transfer pipe system obviously allows of a long inlet period, while the admission of gas from the cylinder head helps to scavenge the cylinder.

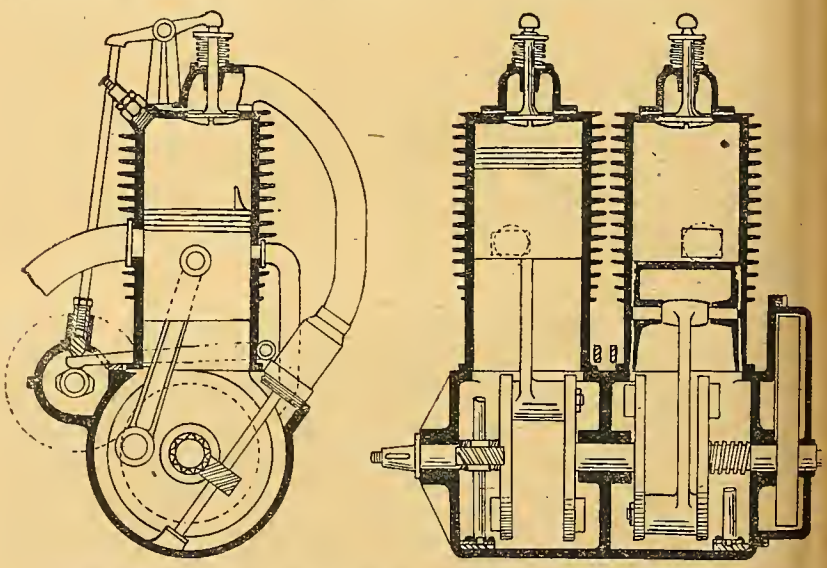


The Every-Clayton two-stroke, which has a two-cylinder engine set across the frame. Note the counter-shaft and large driving pulley.

The constructional details of the engine are of some interest, for the crankshaft is built up, four internal flywheels be used. The crank case is split horizont and carries the camshaft across the fr while a chain drive is used to the coun shaft. The rotary valves are driven skew gear direct from the crankshaft, a plain bearings are used throughout. final drive is by belt, and a hub gear v probably be used. The frame has the tube slightly sloped.



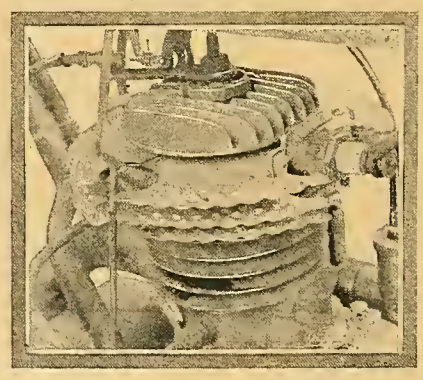
Part of the Every-Clayton twin-cylinder two-stroke showing the rotary distributer valve case, overhead inlet valve and auxiliary transfer release.



Diagrammatic views of the Every-Clayton engine showing the skew gear drives for the rotary valves and mechanically operated inlet.

A NEW RADIATOR FOR AIR-COOLED ENGINES.

An air-cooled engine with special cooling flanges is now no uncommon sight, for it is fairly generally realised that, though the standard cylinder ribs are good conductors, they do not dissipate the heat as quickly as might be. Messrs. Mills, of 15, Conway Road, Southgate, N., have recently introduced a method by which a series of aluminium plates of peculiar studded form are connected into a continuous heat dissipating chain by hooks and springs. The aluminium segments have tongues of the same material riveted to them, and are pressed firmly between the ribs, and are connected as explained above. Three rings are recommended for most engines, but those whi have no ribs on the head may fit a four We hope to carry out experiments as the efficiency of the "Koolah" fins they are called on a modern two-stro



THE WESTOVIAN MOTOR CYCLE.

A new motor cycle which is bei marketed at a very attractive price the Westovian, made by R. V. Hea and Son, 24, Catherine Street, Sou Shields. The power unit is the Precisio and various powered engines from 2½ h. to 4¼ h.p. are fitted. The equipment the machine is very thorough, and t specification embraces nothing but t best fitments.

The Progress of Lightweights from Year to Year

Extracts from Commentary Articles in "The Motor Cycle," 1903 to 1910.

ALTHOUGH the early type motor cycles were really lightweight machines as we now know them, the fact that they were generally fitted with inefficient engines, troublesome systems of transmission (belts and fasteners a few years ago were not the good now obtainable), and the absence of change-speed gears soon brought them into disfavour. The more efficient heavyweight quickly replaced the lightweight, but every sound writer realised to the full that the lightening process was only a question of time, and that gradually, but surely, an efficient lightweight would be evolved. Motor cyclists have to thank (1) the high-tension magneto, (2) the improvement in engine efficiency generally, (3) the adoption of spring forks, (4) the production of reliable change-speed gears, and (5) the perfecting of the two-stroke engine for hastening the arrival of really efficient lightweight motor cycles.

Many recruits to the pastime are apt to look upon the lightweight as something new, and, though in its new guise it is certainly different from its original prototypes, the lightweight is actually the oldest type of machine, and its progress may be followed from year to year by a perusal of the extracts from *The Motor Cycle* given below. Incidentally, our pages provide the only record by which the history of the lightweight may be traced, as for six years *The Motor Cycle* was the only journal devoted to the encouragement of the pastime and the improvement of the breed of motor cycles generally. We did not hesitate to criticise when we considered such criticism desirable. The fruits of our spade work are now being reaped by all and sundry, the motor cycle movement having grown to proportions few ever dreamed it would attain.

From "The Motor Cycle," November 11th, 1913:

"A fairly light machine which can be pedalled with comparative ease for a short distance is, on the whole, preferable to a heavy cycle for city work, and if it has a low frame, it can be rapidly mounted and dismounted with slight trouble."

Issue of September 26th, 1904, page 925:

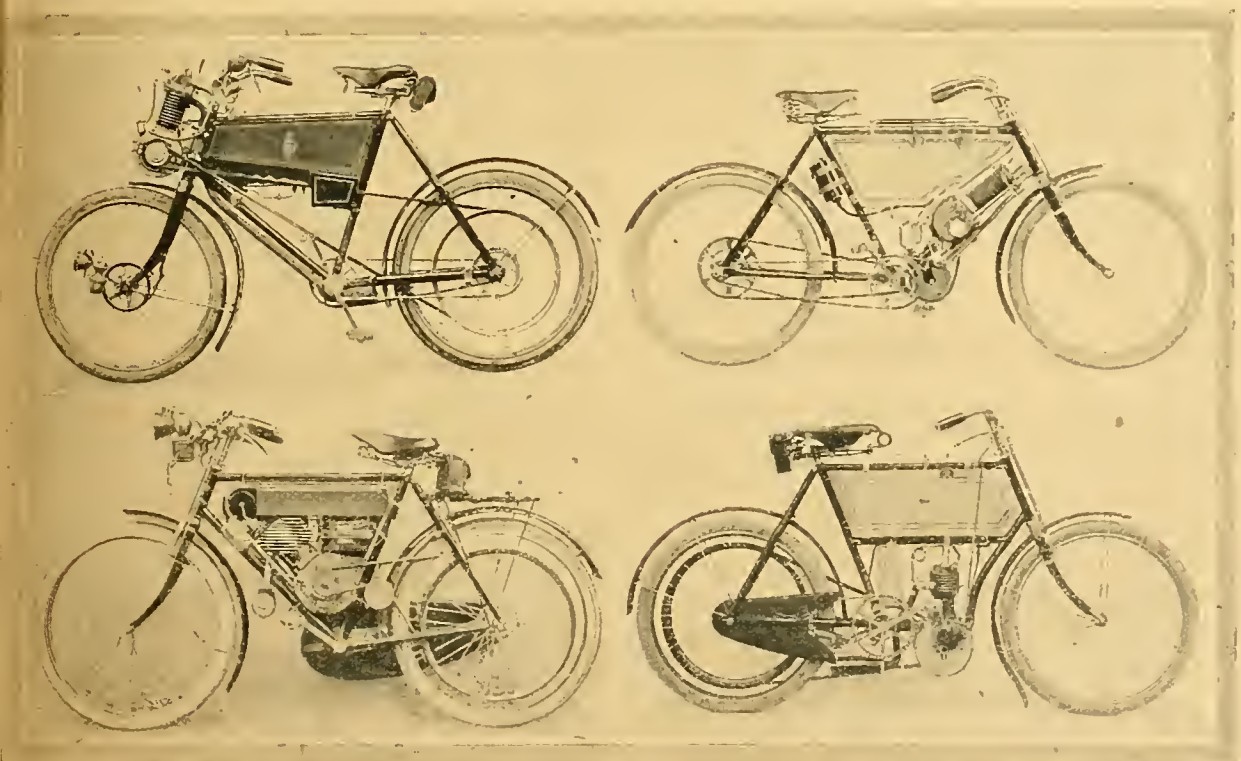
"There is no novelty in seventy pound machines; they were made two years ago, exhaustively tried, and found wanting, and one of their first defects was excessive vibration. The motor bicycle can be, and will be, lightened, but the first aim should be—and it has been with the majority of makers—efficiency and a reasonable margin of strength. The lightening process will be gradual, and not seventy pounds at a time. Weight is a great drawback, but it is at present the lesser of two evils."

Issue of February 20th, 1905, page 160:

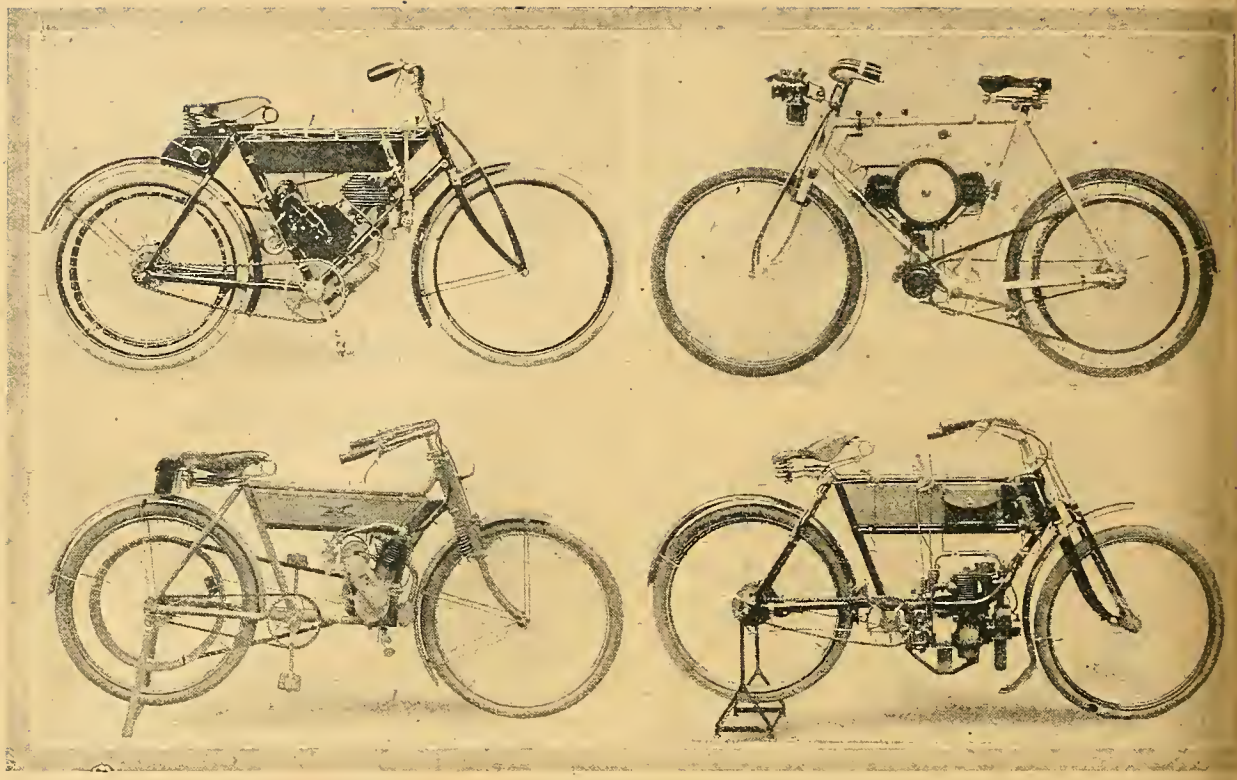
"Firstly, *The Motor Cycle*, as all practical riders do, advocates Efficiency spelt with a big E.

"Secondly, it advocates flexibility.

"Thirdly, it advocates simplicity, coupled with easy means of control.



(1) A lightweight which was much in vogue ten years ago was the belt-driven Werner. Note how the belt is crossed near the steering head
(2) Another early type which scored a great success was the single cylinder 1¾ h.p. Clement Garrard, which had chain drive and a two-speed gear
(3) Looking at the above photograph, one would hardly credit that this well designed featherweight—the Motosacoche—is ten years old
(4) The lightweight Ariel, which ranked as one of the foremost machines in 1904.



A FEW SPECIMENS OF LIGHTWEIGHT DESIGN, 1906 TO 1910.

(1) The 1¾ h.p. single-cylinder N.S.U. of 1908. (2) The horizontally opposed twin-cylinder Fairy, one of the most up-to-date lightweights of its time (1906) and the forerunner of the 2¾ h.p. Douglas. As may be seen the chain and belt drive was a feature of this machine, as well as the countershaft clutch operated by a Bowden control. (3) Another featherweight machine was the single-cylinder Wolf, which was fitted with external flywheel and enclosed chain drive to the magneto. (4) One of the earliest types of single-cylinder F.N. with two-speed gear and shaft drive.

"Fourthly, it advocates ample strength.

"And lastly, it distinctly states on every available opportunity that it would like to see the modern motor bicycle weight less than it does at present.

"Put into a nutshell—what we wish to say is, we intend to do all we can to foster the go where-you-please machine."

A.C.C. Lightweight Trial Abandoned in 1905.

Issue of March 13th, 1905, page 227:

"We should be very sorry indeed to see a trial for lightweight machines abandoned entirely, and we have every hope that the Auto Cycle Club will include a class for machines weighing under 100 lb., all on, in the 1,000 miles trial."

Issue of February 26th, 1906, page 1273:

"The weight and change-speed gear questions are the problems of the future, but every day brings the ideal motor cycle nearer."

"Ixion," on March 5th, 1906, page 1301:

"I quite expect that by 1909 I shall sit a mount that fears no hill, can do 45 miles per hour on the level, and run very smoothly, while not exceeding 130 lb. all on. In course of time the petrol turbine may come, and we shall obtain the same attractions on a mount scaling 75 lb."

Issue of December 25th, 1907, page 1022:

"Now what is wanted is that some of the enthusiasts who regularly own two machines should give the lightweights a trial next year, and by riding them publicly in an odd trial or two, and by sending their experiences to *The Motor Cycle*, inform a tardy and incredulous public that wherever weight has hindered the progress of motor cycling, the impediment cannot any longer be alleged."

Issue of January 15th, 1908, page 45:

"The 1907 Stanley Show has made it quite clear that a really efficient lightweight, low-powered motor bicycle must be in future added to the popular and successful classes. This is a great advance, and it is obtained by two parts of the machine. The engine is a great deal more efficient, and very light and efficient magnetos have been substitute for small batteries. . . . Several of the light machin now on the market are thoroughly reliable and efficie touring mounts."

"Ixion," issue of September, 1908, page 707:

"As soon as the lightweight is as efficient as the 130 l and 160 lb. machines, it will enter upon a tremendous vogu . . . It is, to my mind, very absurd to pretend that t lightweight cannot within a short time prove itself t equal of its heavier compeers in all respects, speed alo excepted."

Issue of October 27th, 1909, page 817:

"Another healthy bantling of the trade is the ligh weight. It continues to equal the performances of t second-rate roadsters in the big reliability trials. . . If a lightweight is put in the hands of a steady-goin driver, it will give faithful service, and only needs certai transmission improvements to make it the equal of standard tourist mount."

Olympia Observations.

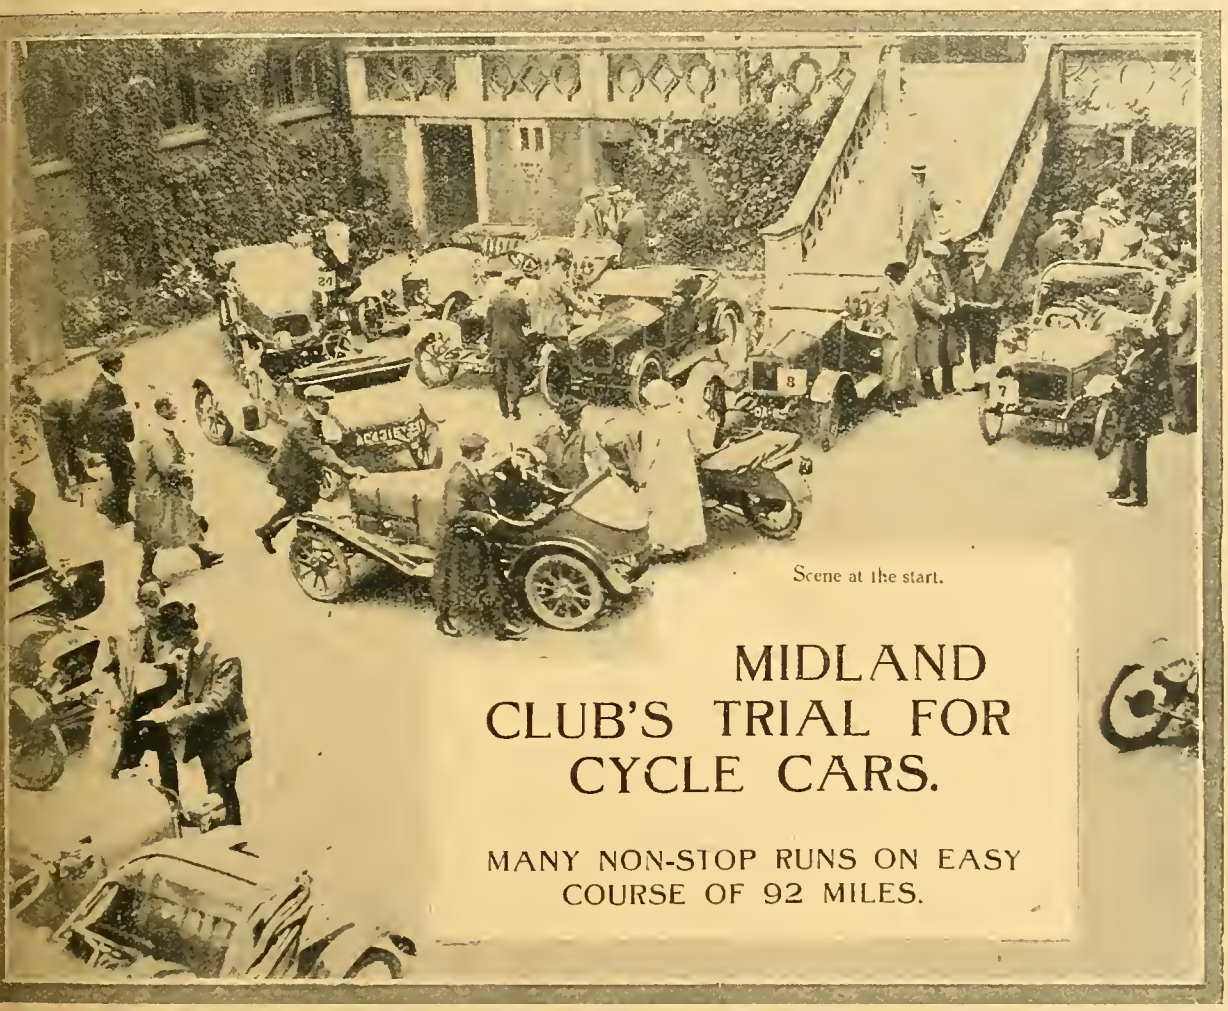
"One can now buy a machine with a comparativel tiny motor with the knowledge that it will climb an main road hill, simply through the agency of the emergenc gear."

Issue of November 24th, 1910, page 1143:

"I never saw such a taking selection of lightweight There are a baker's dozen, any one of which should promis us a really jolly time, and I am more than ever incline to devote a large percentage of valuable time to ridin lightweights."—B. H. DAVIES.

"Ixion," Issue of August 25th, 1910, page 810:

"My last convert to our common hobby is a wholesal grocer. On my advice, he invested in a good 1¼ h.p. 80 lb lightweight, which is powerful enough to take all the hills i a moderately undulating neighbourhood. His travelling cost are reduced by seventy-five per cent., and his rounds onl occupy two to four hours, as against six to ten.



Scene at the start.

MIDLAND CLUB'S TRIAL FOR CYCLE CARS.

MANY NON-STOP RUNS ON EASY COURSE OF 92 MILES.

GOLD medals were cheap on Saturday in the first open competition for cycle cars organised by the Midland Light Car Club. Twenty-four competitors started from the Midland Wheel Club's premises at 2.30 p.m. over a ninety-two miles course destitute of test hills, with the sole exception of Ankerdine, a half-mile climb averaging about 1 in 8.

There were several in the competition who took part in the Six Days Trials, and naturally they looked upon it as a tea party. There were tests, however, to catch the unwary, notably the stopping and restarting test on Rose Hill, Redhal, where Mrs. Powell (Humberette) accidentally stopped her engine in engaging the clutch. A Horstmann stopped on Ankerdine, where the majority of the water-cooled vehicles boiled merrily, two others went off the course, but, except for punctures, there was nothing left to trouble the competitors. Oliver was driving a Morgan with an M.A.G. air-cooled engine, and it so happened that on Ankerdine he found himself side by side with H. F. S. Morgan, whose runabout had a water-cooled overhead valve J.A.P. The pair automatically opened out and disappeared from view side by side in a cloud of dust. Burgess's Calthorpe, however, was agreed to be fastest on the hill. Anderson's Humberette which had Harcourt radiators to the air cooled cylinders, went up on middle gear. Sambidge, who suffered an early puncture, sped up the hill with ease.

A flexibility test followed the tea interval, and after a few competitors had passed a constable appeared and seemed quite concerned to see the little cars crawling along at snail's pace in the slow test and proceeded to examine all licences and inspect numbers. Morgan and Busby, on Morgans, made the best show of the lighter type vehicles to all appearances, though Mrs. Powell and Martin Anderson handled their Humberettes with much skill. The remainder of the run was *via* Bromyard and Worcester over easy main roads, and at the finish there was a weary wait for the consumption to be checked. The most economical machine was Busby's Morgan, which equalled 52.6 m.p.g. The engine is a J.A.P. and the carburetter an Amac

The results issued late the same evening were as under, twelve gaining gold medals and seven silver medals.

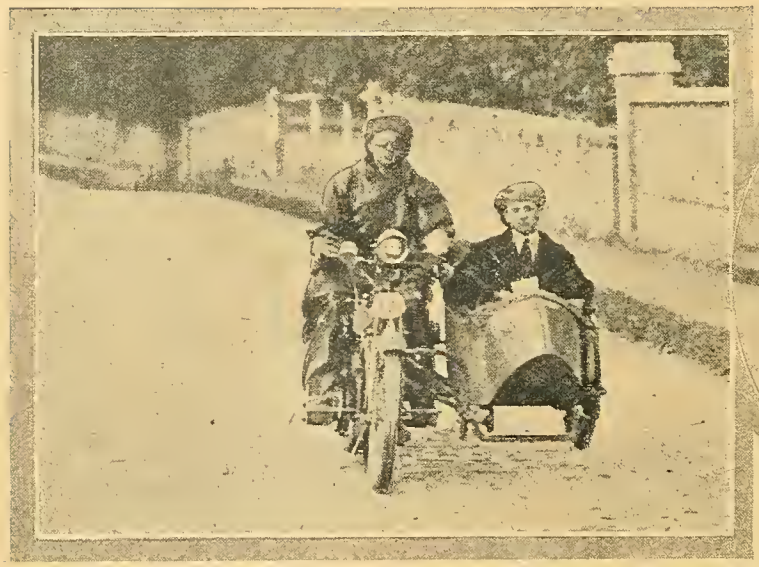
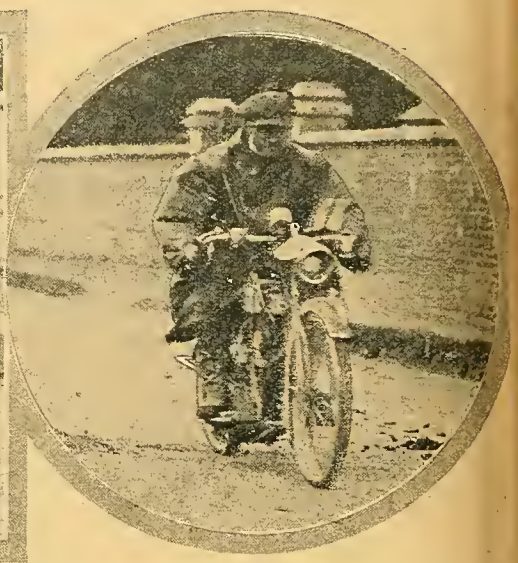
Irish End-to-end Reliability Trial.





(1) F. M. Summerfield (6 h.p. New Hudson sidecar) leaving Dublin. (2) J. Stewart (2¾ h.p. Douglas), who enjoys the distinction of having competed in all the Irish End-to-end trials. He is considered a likely winner.

THE annual Irish End-to-End reliability run, promoted by the Ulster Centre of the Motor Cycle Union of Ireland, was held on Thursday and Friday, the 16th and 17th inst., starting from Mizen Head in County Cork. Hitherto the trial has been a one-day affair, but it was felt by competitors and promoters alike that the riding of 390 odd miles with only one stop was more of a test of endurance of the riders than of the reliability of the machines. On the present occasion it was decided to extend the trial over two days, and the distance was increased by the inclusion of Killarney and Limerick in the first day's ride, whilst on the second day, instead of finishing at Fair Head, the ride was continued to Belfast, the total mileage being 505¾. The route from the start was hilly, and at the end of seventy miles the first test hill was encountered, a portion of the mountain pass of Ballaghabeama being observed. The ascent did not seriously trouble the solo machines, but some of these with sidecars attached found difficulty in getting up. At Killarney, the first open check, Armstrong (3½ Triumph), Granger (6 Bradbury sc.), Longton (3½ Alldays), Parkes (6 New Hudson sc.), Summerfield (6 New Hudson sc.), Phillips (2¾ Douglas), Francis (3¼ Lea-Francis), Fitzgerald (2¾ Levis), Black (5 Rudge), and Wray (5 Clyno) were late. Gibson (2¼ Clyno), the first man to arrive, was considerably ahead of schedule. At Limerick the majority of the riders had made up their time, Parker, Black, and Beattie (2¾ Sunbeam) being the late arrivals. There were secret checks near Tipperary and Monasterevan. At the former several of the men were found to be more than the permissible ten minutes ahead of time and may therefore be disqualified. Thirty-two riders arrived in Dublin at the completion of the first day's run, and all of these were within the limit of tim with the exception of Parkes who lost his way near Killarne

The second day's ride was plain sailing until the test hil were encountered near Fair Head, and a goodly percentag failed to make clean ascents of the Green Hill, Dan Nanc and Isear. Those who failed to make clean ascents were Armstrong (Triumph), Greene (3½ Rudge), Summerfield (Ne Hudson), Chambers (3½ B.S.A.), Francis (Lea-Francis), Alle (2¾ Douglas), Browne (3½ Rover), Cox (3½ Douglas), Da (2½ Sun), Beattie (2¾ Sunbeam), Fox (3½ Rudge), and Hosfor (3½ Rover). Fitzgerald evidently took a different route an avoided the hills as he failed to put in an appearance.

Those who finished and were timed in at Fort Willian Belfast, are :

Armstrong (3½ Triumph)	Woods (3¼ B.S.A.)
Greene (3½ Rudge)	Fitzgerald (2¾ Levis)
Gibb (2¾ Douglas)	Maldon (2¾ Sunbeam)
Cameron (3½ Triumph)	Browne (3½ Rover)
Longton (3½ Allday)	F. Smith (Clyno)
Fairell (4 Triumph)	Cox (3½ Douglas)
Summerfield (6 New Hud on sc.)	Day (2½ Sun)
Gibson (2¼ Clyno)	Dwyer (4 Triumph)
"Sou' Wester" (2¾ Dou_la_)	Wilhelmj (5-6 Bradbury)
Chambers (3½ B.S.A.)	Beattie (2¾ Sunbeam)
Phillips (2¾ Douglas)	Henderson (5 Rudge)
Bees (4 L.M.C.)	Fox (3½ Rudge)
Francis (3¼ Lea-Francis)	Hosford (3½ Rover)
Allen (2¾ Douglas)	Gregson (4½ Bat)
Stewart (2¾ Douglas)	Jones (3½ B.S.A.)

The result will not be declared for a few days, as th committee have to verify the returns from the variou controls. It was pretty generally understood that th winner will turn out to be either F. Smith (Clyno) or J Stewart (Douglas), and that the team prize will go to th B.S.A. trio.

More Records Beaten.

O'Donovan on a 3½ h.p. Norton lowers the Five and Ten Miles Times.

ON Friday, the 17th inst., D. R. O'Donovan, riding a 3½ h.p. single-cylinder Norton of 490 c.c. (79 × 100 mm. bore and stroke), made a successful attempt on the flying five mile and standing ten mile times. The day was fine and warm and there was a slight breeze. The Norton was in fine fettle and clocked 3m. 57⅕s. or 75.88 m.p.h. over the five miles, thus breaking the previous record held by G. E. Stanley (3½ h.p. Singer) by 2.77 m.p.h.

The standing start ten miles took O'Donovan 8m. 11⅕s., which works out at 73.29 m.p.h., and beats Stanley's previous record by 2.9 m.p.h. The Norton's fastest lap was made at 76.07 miles per hour

The speed of 3½ h.p. machines is steadily creeping up, and to lower the previous five mile record b 2¾ m.p.h. is a feat worthy of special note. Th Norton's performance is likely to draw some of ou crack riders from their shells, though we hear of severa who propose to make attempts on existing records a the B.M.C.R.C. meeting on Saturday next. Th machine was fitted with Binks carburetter, Ruthard magneto, Continental tyres, Lyso belt, and use Pratt's spirit. The new records stand for classes C and D.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Kent to Devon.

How would you advise me to go from Ashford in Kent to Ilfracombe? My machine is of 6 h.p. with a sidecar. What would the distance be?—C.J.H.

ur best route would be to go from hford through Charing, Maidstone, rotham, Sevenoaks, Westerham, Reie, Redhill, Dorking, Guildford, Hogs ck, Farnham, Odiham, Basingstoke, dover, Ludgershall, Upavon, Devizes, owbridge, Wells, Glastonbury, Bridgter, Williton, Minehead, Porlock, Lynuth, Ilfracombe. The latter part of s route is exceedingly hilly, and if u would prefer a less hilly route we uld advise you to go from Bridgwater Taunton, and then *viâ* Milverton, mpton, South Molton, and Barnstaple. e distance for the first route is approxitely 240 miles, while the latter is out 20 miles longer. The scenery is y fine, but the Devon roads rather gh in parts.

Stiffness in the Engine.

I have a 3½ h.p. two-speed machine, and lately the engine has taken to squeaking as soon as it begins to labour at all, but it never knocks; for instance, if I cut-out for a corner on a gradient it will squeak when picking up again. It will squeak on a hill before I change down to second gear, and, in consequence, I have to change down some time before I should do in the ordinary course. As soon as I change down the squeaking ceases. I ought to mention this is all with a sidecar, because, when riding solo there is no labouring at all as the machine is really a powerful one. I thought it might be the exhaust valve sticking in the guide through heat, but I do not think that this is so. I should be much obliged if you could help me to trace the noise.—H.P.L.

e squeaking may be caused through a y bearing or through the exhaust lves being stiff in their guides. A little ucklead round the stem would help tters. It is obviously impossible for us say exactly what the trouble is. The ly thing to do is to examine every rt of the machine with scrupulous care, ing that no grit has worked into the ppets, that the valves work freely in ir guides, and that the bearings are perly lubricated

Difficulty in Starting.

Recently I purchased my first motor cycle, a 2¾ twin, with automatic inlets. The machine was thoroughly overhauled by a friend, and for some weeks I had nothing to complain of. I now have considerable difficulty in starting, often having to run the machine a good distance before it will fire, and at other times it will start off with just a sharp push. Is it possible that the oil I use is too thick? If you could tell me how to remedy this fault I should be greatly obliged. I set the levers correctly, the plugs are clean, spark advanced, and I inject paraffin, but being still a novice I do not know what else to do.—BEGINNER.

As your machine is fitted with automatic inlet valves, it is therefore necessary for you to see that the springs have not weakened in any way. Also test the inlet pipe for air leaks, for if such are present it would make it very difficult for you to start. You had better get the assistance of a mechanically-minded friend to assist you in this work. Also, see that the make and break points of the magneto and the points of the sparking plug are clean.

Faulty Running of Old Engine.

I have an old (alleged 3½ h.p.) long-stroke single-geared motor cycle which I have been running with a sidecar since last Christmas on a gear of 5½ to 1. Of course, it will not take hills of any severity, but lately there has been a falling off of power and slight overheating. The machine will not accelerate smartly, and it appears as though the engine cannot obtain enough gas. I have, however, tested the carburetter and found it in order. The engine is timed correctly. I have cleaned the silencer out, the engine is fairly clean, both the valves have been ground in, and the spark appears to be all right. Do you think stronger valve springs would make an improvement?—F.C.N.

It is quite probable that the valve springs are somewhat weak, and that better running could be obtained by fitting new ones. Again, the symptoms you complain of point to bad carbonisation, and it would be as well to check this point. Also, if the plug has been used very long the electrode might have become somewhat thin through burning, and so cause pre-ignition, the results of which are overheating and sluggishness.

J. L. Norton (3½ h.p. Norton sidecar) on the rough surface of the old road over Cooks Study—which was skirted in the A.C.U. Six Days Trials. Although shown on the Contour map this portion was not followed as the road is now disused.

Front Cylinder Overheats.

Will you kindly suggest some reasons for the front cylinder of my small V twin becoming so much hotter than the back cylinder? The fins are very wide, and it surely gets the cooler air. Could a twisty exhaust pipe account for it? —G.S.O.

We do not think that the twisty exhaust pipe will account for the overheating, although of course the more directly the gases are led to the silencer the better. Probably the overheating you complain of is due to the carburetter being badly fitted to the front cylinder, thus causing an air leak, and to the back cylinder getting its unfair share of oil. A small oil baffle plate to the back cylinder might improve matters.

Uneven Wear of Belts.

I run a well-known make of 4 h.p. machine with a sidecar, but find that belts are a very difficult proposition on account of rubber peeling completely off the side of the belt next to the machine. I removed one in March and fitted a new 1in. belt, but, although no great mileage has been done, this is going in the same way and looks like being completely cleaned of rubber on the inside. Apparently there is no reason for this except general wear. The sidecar is quite evenly adjusted, and I can only put the trouble down to belt imperfection. What is your opinion?—A.T.

If your pulley is drilled out in any way for lightness on the side on which the belt wears the most, it is undoubtedly the cause of this defect. If not, in all probability you are running with the belt out of line. We do not think you can put it down to imperfection of the belt, as we have had a great deal of experience with rubber belts of various makes and have always found them give most excellent service.

South Wales to Land's End.

Will you kindly furnish me with a route from Swansea to Land's End and back, returning by a different route. I ride a 3½ h.p. single-geared machine. What gear had I better use for the Devon hills?—J.A.W.

We believe there is a service of steamers from Swansea to Ilfracombe. If so, we should recommend you to go across the Bristol Channel, and then go through Barnstaple, Bideford, Hartland, Stratton, Bude, then straight along the main road to Tintagel Head; after that, through Wadebridge, St. Columb, Mitchell, Redruth, Camborne, Hayle, Penzance, Land's End. You could return through Marazion, Helston, branch off to the Lizard, if you feel so disposed, then go through Penryn, St. Austell, Lostwithiel, Liskeard, Callington, Tavistock, Okehampton, Bow, Crediton, Tiverton, Taunton, Bridgwater, Axbridge, then turn off for Cheddar Gorge, then go through Bristol, whence there is a service of steamers to Cardiff. From Cardiff you reach Swansea *via* Cowbridge and Bridgend. You had better use a 5 to 1 gear for the Cornish and Devonshire hills, and on occasions you may require a lower ratio.

New Piston Required.

I own a 1912 3½ h.p. single-cylinder, and I have been breaking a great many piston rings. Can you give me a reason for this, and advise how to avoid it? There is also a knock when the machine is at speed, both on the level and down hill, but never on up hill work.—H.B.

The piston is far too slack, and it would be better for you to obtain a new one. By running the engine with too much clearance between the piston and the cylinder walls a very great strain is imposed on the rings. Also you have some wear in the bearings, either the big end or the small end, so that it will probably be necessary for you to have these seen to and rebushed.

A Tour in Scotland.

Could you give me the route from Reading to Edinburgh, *viâ* Oxford, Banbury, etc.? Could you also give me a few interesting places to visit, such as Loch Lomond, and the way to each place, and information concerning accommodation, if possible?—D.W.H.

We should advise you to proceed from Reading, through Shillingford, Dorchester, Oxford, Deddington, Banbury, Stratford-on-Avon, Alcester, Bromsgrove, Kidderminster, Bridgnorth, Wellington, Hodnet, Whitchurch, Tarporley, Warrington, Wigan, Preston, Lancaster, Kendal, Penrith, Carlisle, Longtown, Langholm, Hawick, Selkirk, Galashiels, and thus to Edinburgh. Loch Lomond can be easily reached by going from Edinburgh, through Linlithgow, Stirling, to Kippen, over the Aberfoyle Pass to Inversnaid. Your best plan would be to get the Auto Cycle Union or the A.A. and M.U. to work out this route for you, when they will supply you with a guide book of the districts you wi to visit, and all information you desir We regret we cannot undertake to wor out route cards, etc., for you; we mu leave this to the touring departmen of the motoring organisations, who mal a speciality of this kind of wor although we are always glad to supp routes from place to place.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"W.I." (Ledbury).—7 h.p. India Ease of starting by means of electric outfit. Comfort on bad roads.

"W.S.M." (Orkney).—1914 4 h. Triumph. Starting, reliability, durabilit Also Hopley sidecar with folding chass

"Phœnix" (Perthshire). — Hend Special Indian with sidecar, particular as to efficiency of electric starter a lighting.

"A.W.K.M." (Jersey).—Standard tw Indian with sidecar. Reliability, hi climbing, petrol consumption, electr lighting, two-speed gear, clutch, etc.

"T.M." (Sussex).—Wear and durabili of Pedley, John Bull, Dunlop, and Ly Reliable belts, especially on 1913 3½ h. Zenith-Gradua clutch model; also Bin and Senspray carburetters

"S.P." (Gloucester).—New Imperi Jap 2½ h.p. two-speed, and St Villiers two-stroke single gear. Rel bility, petrol consumption, hill-climbi speed, etc.

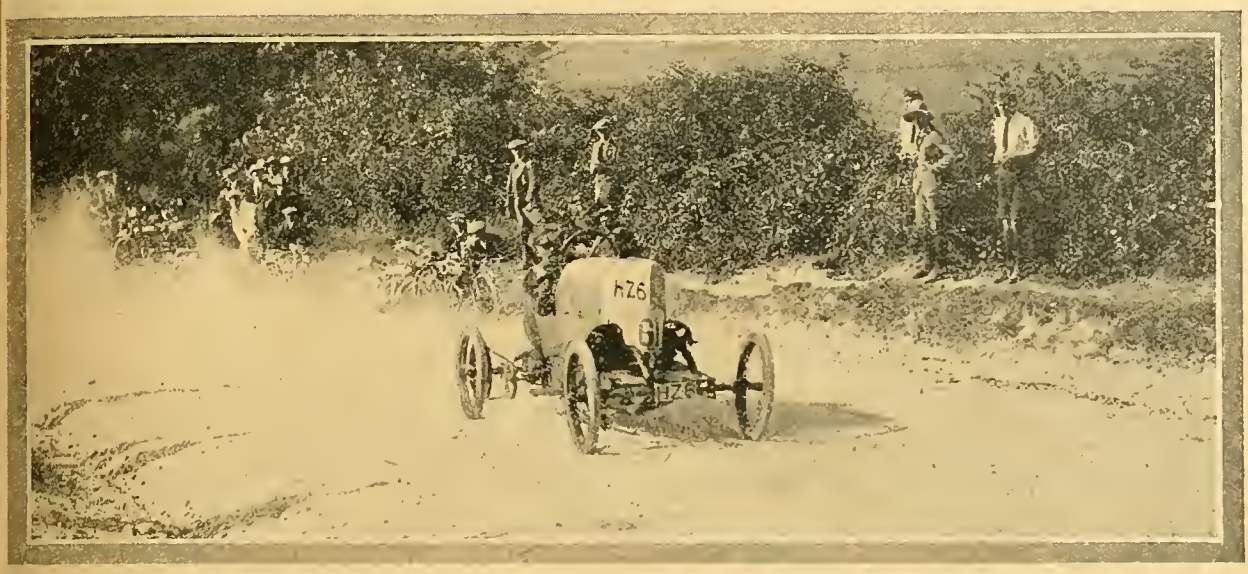
"J.H.G." (Manchester). — Reliabili hill-climbing, and comfort of 7 h.p. Indi (Hendee Special), with Montgomery spri frame or standard sidecar; 8 h Williamson (water-cooled); 7 h.p. F. and 3¾ h.p. Scott with a Canoelet Luxe sidecar or standard.

A.C.U. SIX DAYS TRIALS.

W. G. Ayling (1½ h.p. two-stroke Dayton), who took to the pathway on Lee Hill, Shibden Dale on account of the stony road surface and deep gullies.

THE CYCLECAR CLUB'S HILL-CLIMB.

Successful Event at South Harting. Fastest Time by Four-wheeled Air-cooled Monocar.



A 10h.p. belt-driven G.N., with a curious form of racing body, is seen making a good ascent in Class VI

THE annual hill-climb organised by the Cyclecar Club was held on South Harting Hill on Saturday last in glorious weather. There was an excellent entry list, and, with the exception of one long delay, caused by an accident, the event was run off pretty promptly. Vehicles of all types took part, from the crude and curious to the comfortable and costly, and formed an imposing display after the event, when they were ranged up in Petersfield on both sides of the road near the Dolphin Hotel. Many motor cyclists were present to witness the event. There was only one entrant in Class I. for standard touring cycle cars under 750 c.c., and he did not start. Class II., for standard touring light cars and cycle cars, was well supported, and as regards speeds the G.N.'s were *facile princeps*. Godfrey, who ran second as regards time, had his belts so slack that they flopped about and almost touched the ground, and the same may be said of the Adamson. A good ascent was made by the 8 Thurlow, a short wheelbase three-wheeler.

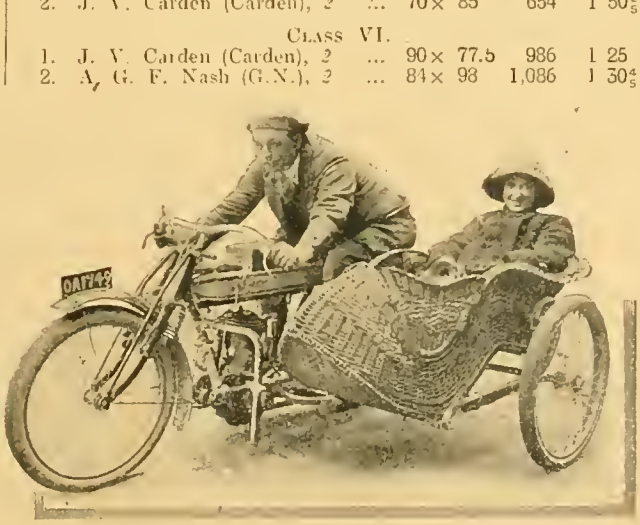
The Ladies in Trouble.

In Class III., for standard touring light cars over 1,100 c.c. and under 1,500 c.c., two of the Calcott drivers made the grievous mistake of changing up too early, while in Class IV., for lady drivers of standard touring machines, three out of five of the fair competitors came to a standstill, Miss Price's Mathis owing to a fault in the petrol feed, Miss Portwine (A.C.) stopped her road wheels for a second while changing gear, and Miss Douglas (de P.), who came to a complete stop. Class V., for standard touring monocars, produced the real excitement of the afternoon. At the beginning of the S bend Holzapfel (Carden) had a bad skid, and at the next turn skidded again in the other direction, and turned over with the machine on the top of him. He was not seriously injured, but was rather badly cut about the face, and the accident caused a considerable delay. In this class and the next the behaviour of the Cardens, which were fast, excited considerable comment, and it was observed that they took the corners sometimes on two wheels, sometimes on three (and even on one!), while one spectator said that before Holzapfel's spill both inside wheels of the machine were in the air for some time. In Class VI., for racing vehicles, the Buckingham blew out a plug.

It will be noticed that Carden made the fastest time of the day in this event. The hill is 1 mile 73 yards long, has an average gradient of 1 in 12, and a maximum gradient of 1 in 7.3. The surface was somewhat loose.

The results on time were got out promptly, and were as follow:

	Driver and car.	mm.	c.c.	m. s.
	CLASS II.			
1.	A. G. F. Nash (G.N.), 2-cyl.	84×98	1,086	1 51⅘
2.	H. R. Godfrey (G.N.), 2 ..	84×98	1,086	1 59⅘
	CLASS III.			
1	D. Cohen (Bugatti), 4 .. .	65×100	1,327	1 55⅖
2.	E. A. Lippold (Calcott), 4 ...	65×110	1,460	2 37⅕
	CLASS IV.			
1.	Mrs. Warren-Lambert (Warren-Lambert), 2	88×90	1,095	2 52⅖
2.	Miss Portwine (A.C.), 4 ...	59×100	1,096	3 9⅗
	CLASS V.			
1.	W. E. Humphries (Carden), 2	70×85	654	1 29⅖
2.	J. V. Carden (Carden), 2 ...	70×85	654	1 50⅖
	CLASS VI.			
1.	J. V. Carden (Carden), 2 ...	90×77.5	986	1 25
2.	A. G. F. Nash (G.N.), 2 ...	84×98	1,086	1 30⅘



Dan Bradbury on his 3½ h.p. Norton sidecar, on which he won four firsts in the Sheffield and Hallamshire M.C.C. speed trials last Saturday. This is the last of a series of three speed trials in which Bradbury has made the best aggregate performance both on time and formula.

"THE MOTOR CYCLE" LIST OF CLUB EVENTS.

July 25th.—Exeter and District M.C.C. Reliability run to Newquay.
„ 25th.—Lincolnshire A.C. (Motor Cycle Section). Knock-out hill-climb at Scamblesby.
„ 25th.—Matlock and District M.C.C. Hill-climb.
„ 25th.—Dublin and District M.C.C. Race meeting at Portmarnock.
„ 25th.—Woolwich, Plumstead, and District M.C.C. Run to Crown Point, Igbtham.
„ 25th.—Kilmarnock and District M.C.C. Run to Loch Lomond.
„ 25th.—Streatham and District M.C.C. Night trial for Dobson Cup, and club run to Bookham.
July 25th.—Cardiff and District M.C.C. and Newport and District M.C.C. Inter-club trial.
„ 25th.—Castleford M.C. Paperchase.
„ 25th.—Plymouth and District M.C.C. Run to Cheesering *via* Tavistock and Callington, starting at 2.30 p.m.
„ 29th.—Folkestone and District M.C.C. Cricket match on Dymchurch Sands, 2.30 p.m.
„ 29th.—Middlesbrough and District M.C.C. Old crock hill-climb.
„ 30th.—East Essex M.C.C. Run to Clacton.

Ashford and District M.C.

A motor club has been formed for Ashford (Middlesex) and district. Those who wish to join should write to the hon. secretary, Mr. G. E. Coppard, Clarendon Road, Ashford, Middlesex.

Plymouth and District M.C.C.

A hill-climb was held at Moorshop Hill recently and proved most successful. There were thirty-five entries, and the results were :

Sidecar Class (up to 1,000 c.c.)—1, T. D. A. Chapman (8 Bat), 2m. 1½s. ; 2, L. A. Brand (6 Hobart), 2m. 8½s. ; 3, H. L. Heal (8 Alldays), 2m. 4s.
Solo (up to 350 c.c.)—1, E. J. Jarvis (2¾ Douglas), 1m. 50s. ; 2, S. Foot (2¾ Douglas), 1m. 52s.
Solo (up to 500 c.c.)—1, Lieut. Barry (3½ Triumph), 1m. 18s. ; 2, Lieut. Sandford (4 B.S.A.), 1m. 24s. ; 3, W. L. Bowden (3½ Sunbeam), 1m. 33½s.
Solo (unlimited).—1, P. H. T. Hoare (8 C. and H.), 1m. 1½s. (fastest time on record) ; 2, T. Trinaman (7-9 Indian), 1m. 12½s. ; 3, H. L. Heal (8 Alldays), 1m. 17½s.

Scottish Border M.C.C.

A hill-climb was held at Lanton Hill on the 4th inst. in glorious weather. Results :

Class I.—Up to 350 c.c., on Formula, open : A. H. Alexander (2¾ Douglas).
Class II.—Up to 350 c.c., on Formula, experts barred : T. L. Purdour (2¾ Douglas).
Class III.—Between 350 and 600 c.c., on Formula, open : E. F. Gilbanks (3½ Rover).
Class IV.—Between 350 and 600 c.c., on Formula, experts barred : E. F. Gilbanks (3½ Rover).
Class V.—Between 600 and 1,000 c.c., on Formula, open : Percy E. Tolfree (6 Zenith).
Class VI.—Between 600 and 1,000 c.c., on Formula, experts barred : J. B. Innes (7 Indian).
Class VII.—Any Machine, on Time, open : J. B. Innes (7 Indian).
Class VIII.—Up to 350 c.c., on Time, open : A. H. Alexander (2¾ Douglas)
Class IX.—Up to 600 c.c., on Time, open : E. F. Gilbanks (3½ Rover).

Abergavenny and District M.C. and C.C.C.

The opening reliability trial over a distance of fifty-four miles was held on the 16th inst., the route being through Longtown, Hereford, Ross, and Skenfrith. Results : 1, H. Richmond (6 Enfield sc.), 100% ; 2, L. Jones (6 Enfield sc.), 75% ; 3, H. H. Evans (2½ New Hudson), 74%.

Hamilton and District M.C.C.

A petrol consumption test was held recently with the following result :

		Fig. of merit.	M.P.G.
1.	A. Torrance (3½ Premier)	1196	136.4
2.	G. Semple (3½ Premier)	1120	130
3.	H. Street (3½ Rover)	991	117.8
4.	J. Burners (3½ B.S.A.)	882	92.2

Sheffield and Hallamshire M.C.C.

The last of a series of three flying kilometre trials held by the Sheffield and Hallamshire M.C.C. took place on the 18th inst. The provisional results are as follow :

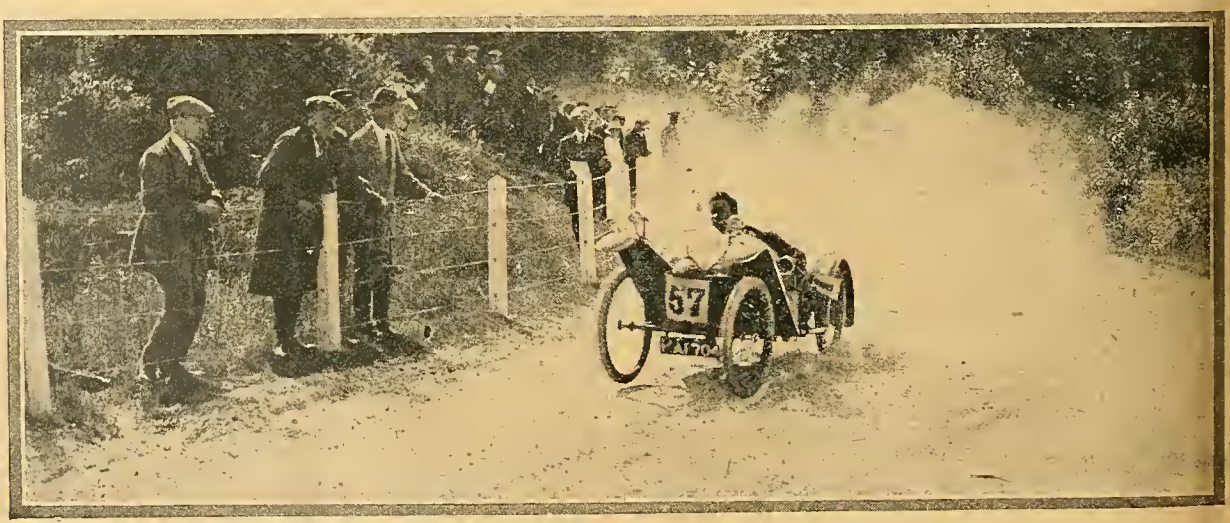
Class II. Lightweights up to 350 c.c. (on formula).—1, R. Cecil (2¾ N.U.T.) ; 2, R. M. Davy (2¾ Enfield) ; 3, T. Barber (2¾ Douglas). Fastest time : R. Cecil.

Class III. Touring Singles, 500 c.c. (on formula).—1, D. Bradbury (3½ Norton) ; 2, R. Flint (3½ Norton) ; 3, L. Lambert (3½ Norton). Fastest time : R. Flint.

Class IV. T.T., 500 c.c. (on formula).—1, D. Bradbury, 3½ Norton ; 2, R. Flint (3½ Norton) ; 3, L. Lambert (3½ Norton). Fastest time : D. Bradbury.

Class VIII. Sidecars (on formula).—1, D. Bradbury (3½ Norton). Fastest time : G. Wilkin (8 Rex-Jap). Fastest time of the day : R. Cecil (7 Indian).

D. Bradbury wins a gold medal for the best aggregate on formula, also a gold medal for time aggregate.



THE SOUTH HARTING HILL-CLIMB OF THE CYCLECAR CLUB.
W. E. Humphries (5 h.p. Carden) rounding the second bend. Note that the inside wheel is off the ground.

The Motor Cycle Buyers' Guide

Illustrations and Specifications

(Alphabetically arranged)

OF

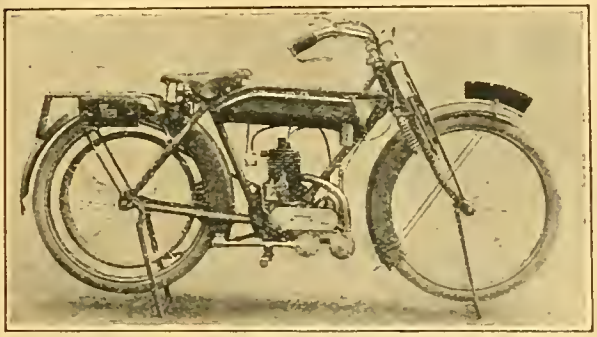
55 TWO-STROKE AND LIGHTWEIGHT MOTOR CYCLES.

This issue being specially devoted to two-stroke and Lightweight motor cycles, we give below a list of 37 two-stroke machines on the British market, and 18 lightweight motor cycles fitted with four-stroke engines of a less capacity than 300 c.c This list, which we have compiled in collaboration with the makers, will, we feel sure, be of considerable service to our readers, particularly prospective buyers, who will find, arranged in alphabetical order, the specifications of all the principal machines of the types mentioned, and their prices, together with a photograph of each. Whilst every effort has been made to ensure accuracy in every detail, we cannot hold ourselves responsible for any mistake which may have crept in.

ALLDAYS.

ngine	70×70 mm., two-stroke, 269 c.c.
nition	U.H. magneto, chain-driven.
arburetter	Senspray or Amac.
ransmission	Belt.
imensions	Height of saddle from ground, 30in. Ground clearance, 5½in. Wheelbase, 48in.
ubrication	Oil and petrol mixed.
ther Features	Druid or Saxon forks.
rice	£25 5s.; 33 guineas with two-speed gear.
ther Models	292 c.c. engine, two-speed counter-shaft, drip-feed lubrication.

Alldays and Onions, Ltd., Fallows Road, Birmingham.

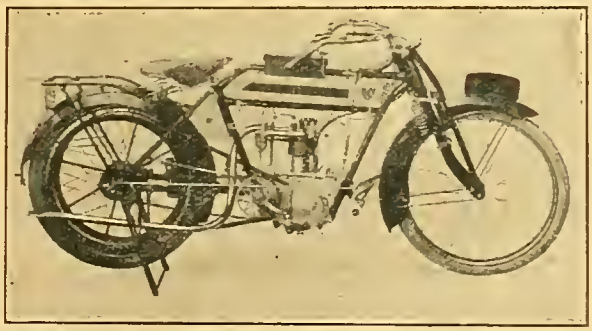


* * *

ALP.

ngine	2 h.p. Alp. 62×85 mm., 257 c.c., overhead inlet valve, four-stroke.
nition	Alp magneto, placed behind engine.
arburetter	Automatic Alp.
ransmission	Belt, ¼in., over adjustable pulley.
imensions	Height of saddle from ground, 30in. Ground clearance, 10in. Wheelbase, 51in.
ubrication	Internal hand pump.
ther Features	Druid forks. Footrests. Foot-operated brake. Tyres, 26×2. Weight, 106 lb.
rice	23 guineas.

Moto-Reve Co., Ltd., Alp Eng. Works, Alperton, Middlesex.

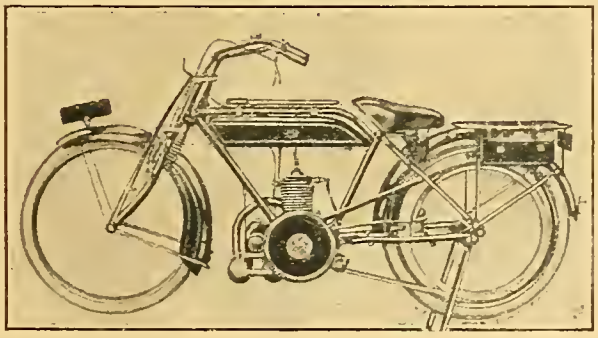


* * *

BOWN-VILLIERS.

ngine	2¼ h.p. Villiers, two-stroke, 269 c.c.
nition	High-tension magneto.
rburetter	B. and B. or Amac.
hange Speed	Two-speed in counter-shaft.
ransmission	Dunlop belt.
ubrication	Oil mixed with petrol.
ther Features	Druid forks. Dunlop or Continental tyres, 26×2.
rice	£35, or single-geared £27 10s.
ther Models	Similar machine fitted with 2 h.p. Precision unit.

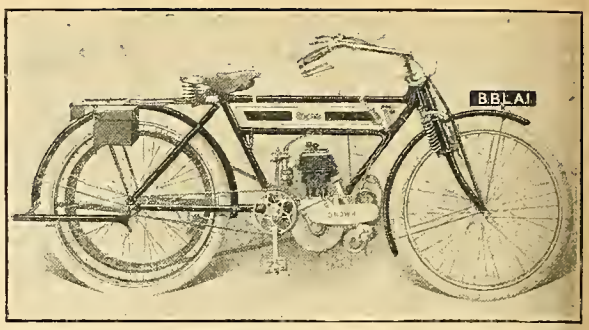
Bown Manufacturing Co., Snow Hill, Birmingham.



BROWN.

Engine . . 2½ h.p. four-stroke, 292 c.c.
Ignition . . Bosch magneto, chain-driven.
Carburetter . B. and B.
Transmission . Dunlop ⅜in belt, adjustable pulley.
Dimensions . Height of saddle from ground, 31½in. Ground clearance, 4½in. Wheelbase, 52½in.
Lubrication . Hand pump.
Other Features. Druid spring forks.
Price . . £36.

BROWN BROS., LTD., Great Eastern Street, London, E.C.

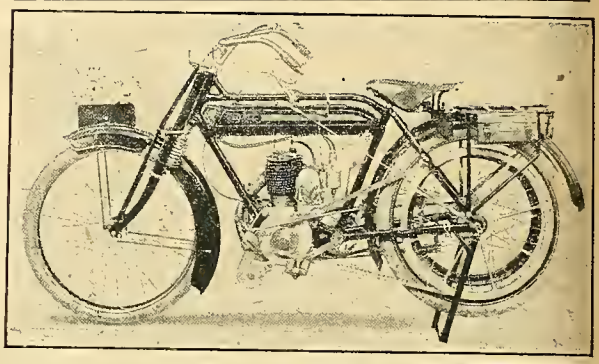


* * *

CALCOTT.

Engine . . 2½ h.p. Calcott, 292 c.c.
Ignition . . Bosch magneto, gear-driven.
Carburetter . B. and B.
Change Speed . Sturmey-Archer three-speed.
Transmission . Belt.
Dimensions . Height of saddle from ground, 34in. Ground clearance, 6½in. Wheelbase, 49in.
Lubrication . Hand pump.
Other Features. Druid forks.
Price . . 33 guineas.

CALCOTT BROS., LTD., Coventry.

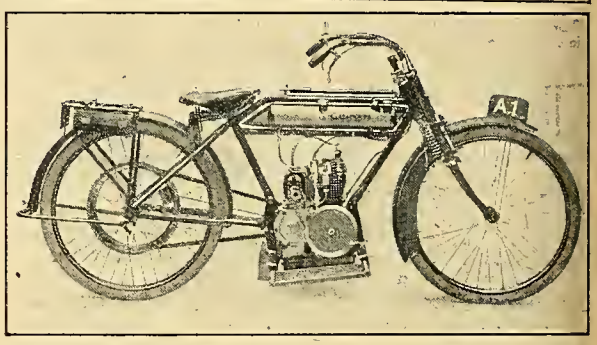


* * *

CALTHORPE.

Engine . . 2 h.p. four-stroke, 170 c.c., overhead horizontal valves.
Ignition . . U.H. magneto.
Carburetter . Amac or B. and B.
Change Speed . Counter-shaft integral with crank case, 7 and 17 to 1.
Transmission . Belt.
Dimensions . Height of saddle from ground, 29½in. Ground clearance, 5½in. Wheelbase, 52in.
Lubrication . Hand pump.
Other Features. Druid forks.
Price . . £26 5s.

CALTHORPE MOTOR CYCLE CO., Barn Street, Birmingham.

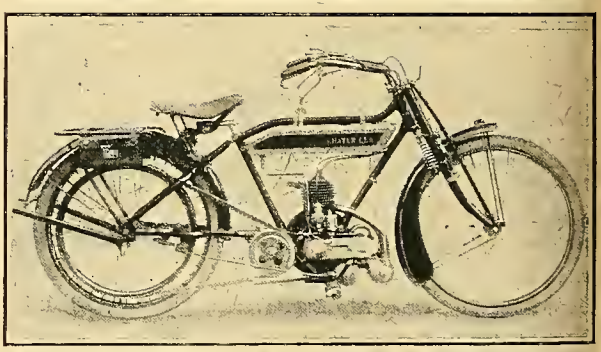


* * *

CHATER-LEA.

Engine . . 2¼ h.p. two-stroke, 269 c.c.
Ignition . . U.H. magneto, chain-driven.
Carburetter . Senspray.
Change Speed . Counter-shaft gear box, 5¼ and 10 to 1.
Transmission . Chain and belt.
Dimensions . Ground clearance, 4¾in. Wheelbase, 52in.
Lubrication . Oil mixed with petrol.
Price . . £36.

CHATER-LEA, LTD., 74-84, Banner Street, E.C.

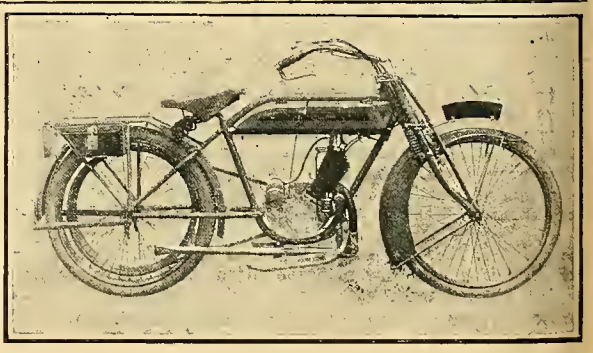


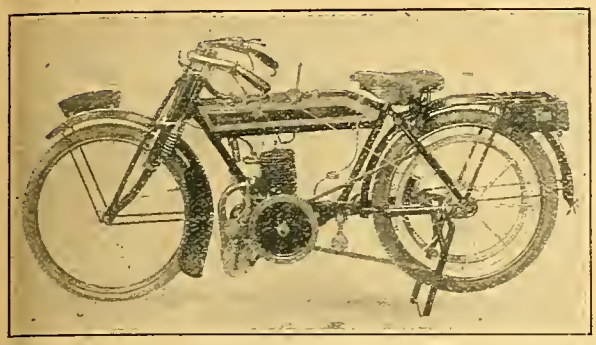
* * *

CLYNO.

Engine . . 2¼ h.p. two-stroke, 269 c.c.
Ignition . . Ruthardt magneto, gear-driven.
Carburetter . Clyno-Amac.
Change Speed . Counter-shaft two-speed, gears 5¾ and 10⅓ to 1.
Transmission . Gear and belt.
Dimensions . Height of saddle from ground, 29in. Ground clearance, 6in.
Lubrication . Oil mixed with petrol.
Other Features. Druid forks. Lucas lamp and horn. Rear light.
Price . . £40. Single-speed, £30.

CLYNO ENGINEERING CO., Wolverhampton.



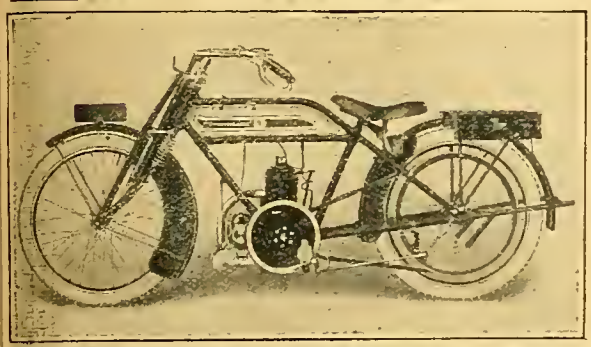


CONNAUGHT.

Engine	2½ h.p. two-stroke.
Ignition	U.H. magneto, chain-driven.
Carburetter	Amac or Senspray.
Change Speed	Fixed gear, Albion two-speed or Sturmey-Archer three-speed.
Transmission	Belt or chain and belt.
Dimensions	Height or saddle from ground, 30in. Ground clearance, 7in. Wheelbase, 48in.–
Lubrication	Oil mixed with petrol.
Other Features	Druid forks. Hutchinson tyres.
Price	£33 10s. £41. £44. Kick-starter, £45.

BORDESLEY ENGINEERING CO., LTD., Birmingham.

* * *

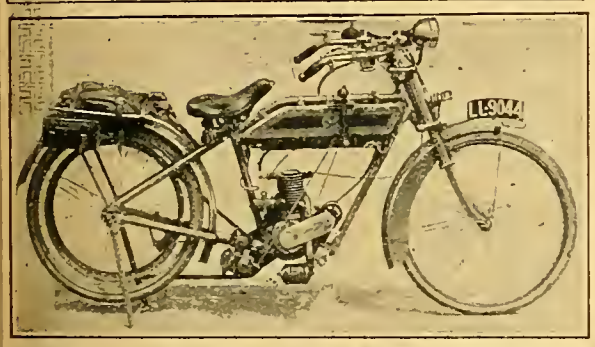


COVENTRY EAGLE.

Engine	2½ h.p. two-stroke, 269 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Senspray.
Change Speed	Counter-shaft two-speed, gears approximately 5½ and 10½ to 1.
Transmission	Chain and belt.
Dimensions	Height of saddle from ground, 26in. Ground clearance, 4½in. Wheelbase, 50in.
Lubrication	Oil mixed with petrol.
Other Features	Druid forks.
Price	37 guineas. Single-speed, 29 guineas.

COVENTRY EAGLE CYCLE AND MOTOR CO., Foleshill Road, Coventry.

* * *

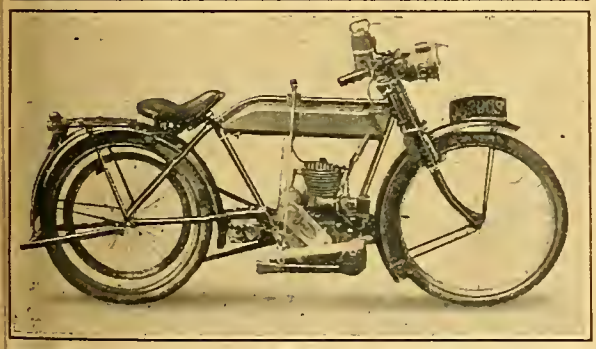


DAYTON.

Engine	1½ h.p. two-stroke, 57×63.5 mm., 162 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Amac.
Change Speed	Two-speed gear box, gears 6 and 13 to 1.
Transmission	Belt and chain.
Dimensions	Height of saddle from ground, 30in. Ground clearance, 3¾in. Wheelbase, 52in.
Lubrication	Oil mixed with petrol.
Other Features	Druid or Saxon spring forks.
Price	23 guineas. Single-speed, 23 guineas. Popular model, 20 guineas.

CHAS. DAY MFG. CO., LTD., 221-2, High Street, Shoreditch, E.

* * *

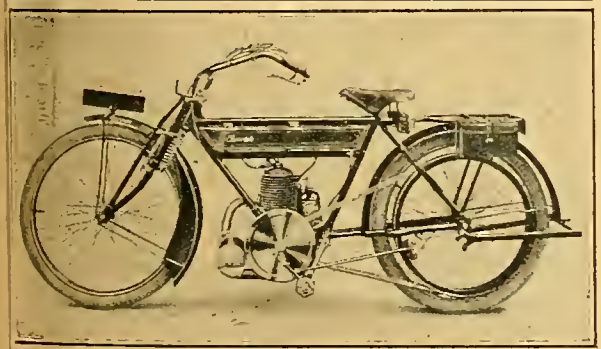


DUNKLEY.

Engine	Dunkley two-stroke, 75×79 mm., 349 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Senspray.
Change Speed	Two-speed counter-shaft.
Transmission	Chain and belt.
Dimensions	Height of saddle from ground, 30in. Ground clearance, 6in. Wheelbase, 52in.
Lubrication	Drip-feed, semi-automatic.
Other Features	Druid forks.
Other Models	2 h.p. four-stroke engine, 170 c.c. 27 guineas

DUNKLEYS, LTD., Jamaica Row, Birmingham.

* * *



ELSWICK.

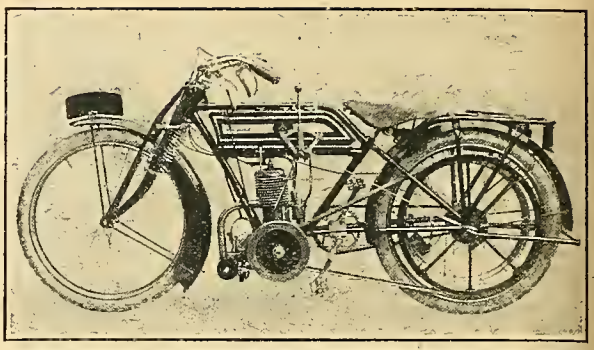
Engine	2 h.p. two-stroke, 269 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Amac or Senspray.
Change Speed	Fixed gear.
Transmission	Belt.
Dimensions	Height of saddle from ground, 30in. Ground clearance, 5in. Wheelbase, 50in.
Lubrication	Oil mixed with petrol.
Other Features	Girder spring forks. Full set tools, etc.
Price	£24. Three-speed, £34 10s.
Other Models	Similar machine with 2 h.p. Precision unit, incorporating two-speed gear. £30.

ELSWICK CYCLES AND MFG. CO., Barton-on-Humber.

FAIRFIELD.

Engine . . 2½ h.p., 270 c.c., two-stroke, three-port type.
Ignition . . Bosch magneto, chain-driven.
Carburetter . Amac.
Change Speed . Fixed, 6 to 1, also Armstrong three-speed, 6½, 8½, and 13 to 1.
Transmission . Dunlop ¾in. belt, h.b. controlled clutch.
Dimensions . Height of saddle from ground, 27in. Ground clearance, 5½in.
Lubrication . Oil mixed with petrol, and hand pump.
Other Features. Druid forks. Dunlop 2in. tyres.
Price . . £29 single-speed. £37 three-speed gear model.

ALFRED FORSTER, Warrington.

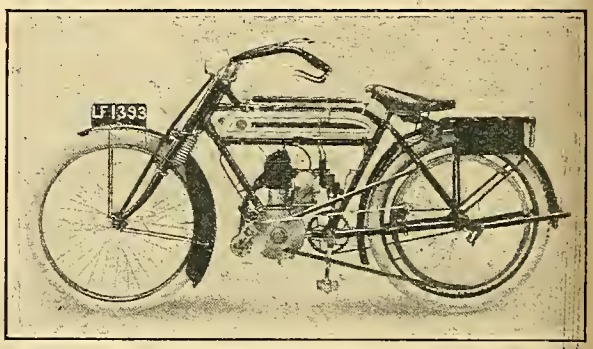


* * *

GAMAGE.

Engine . . 2¾ h.p., 70×76 mm., 292 c.c., four-stroke.
Ignition . . Bosch magneto.
Carburetter . B. and B.
Change Speed . Single-speed or three-speed Sturmey-Archer hub.
Transmission . ⅞in. belt.
Dimensions . Height of saddle from ground, 32in. Ground clearance, 5in. Overall length, 6ft. 8in.
Lubrication . Pump.
Other Features. Druid spring forks.
Price . . Single-speed model, £29 10s. Three-speed model, £38 10s.

A. W. GAMAGE, LTD., Holborn, London, E.C.

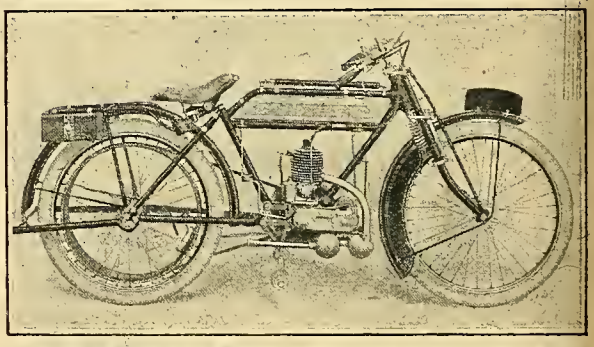


* * *

GERRARD.

Engine . . 2½ h.p. two-stroke Villiers, 269 c.c.
Ignition . . U.H. magneto, chain-driven.
Carburetter . Senspray.
Change Speed . Two-speed counter-shaft.
Transmission . Belt or chain and belt.
Dimensions . Height of saddle from ground, 30in. Ground clearance, 4in. Wheelbase, 47½in.
Lubrication . Oil mixed with petrol.
Other Features. Druid forks, pan seat.
Price . . 25 guineas single-gear. Two-speed £33.

GERRARD ROAD MOTORS, 162, Hagley Road, Birmingham.

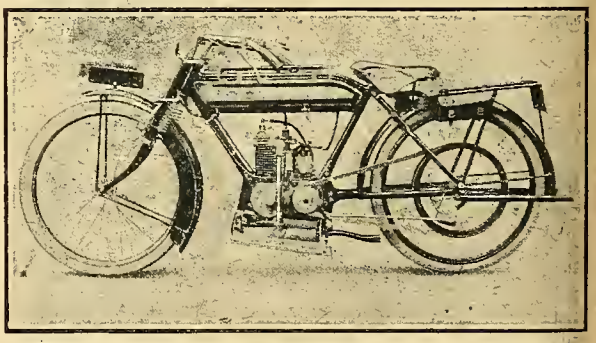


* * *

GRANDEX-PRECISION.

Engine . . 2 h.p. Precision four-stroke, 170 c.c., 60×60 mm.
Ignition . . U.H. magneto, chain-driven.
Carburetter . B. and B. or Amac.
Change Speed . Two-speed in crank case, gears 6½ and 13 to 1.
Transmission . ¾in. belt.
Dimensions . Height of saddle from ground, 27in. Ground clearance, 6in. Wheelbase, 50in.
Lubrication . Hand pump.
Other Features. Druid or Saxon forks.
Price . . 25 guineas.

GRANDEX-PRECISION MOTOR CO., 86, Gray's Inn Road, W.C.

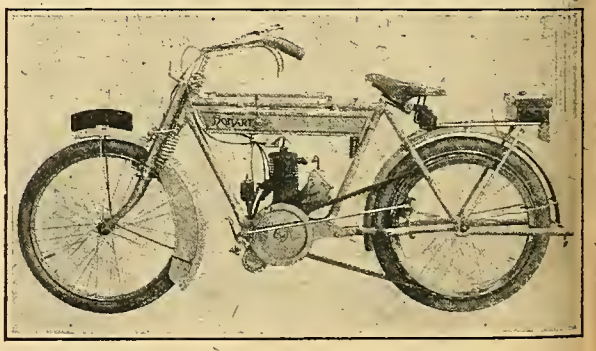


* * *

HOBART.

Engine . . 2¼ h.p. two-stroke, 225 c.c.
Ignition . . Ruthardt magneto, enclosed drive.
Carburetter . Senspray or Amac.
Transmission . Dunlop ¾in. belt.
Dimensions . Height of saddle from ground, 29½in. Ground clearance, 6½in. Wheelbase, 48in.
Lubrication . Oil mixed with petrol.
Other Features. Druid patent forks. Moseley tyres.
Price . . 25 guineas.

HOBART BIRD AND CO., LTD., Coventry.

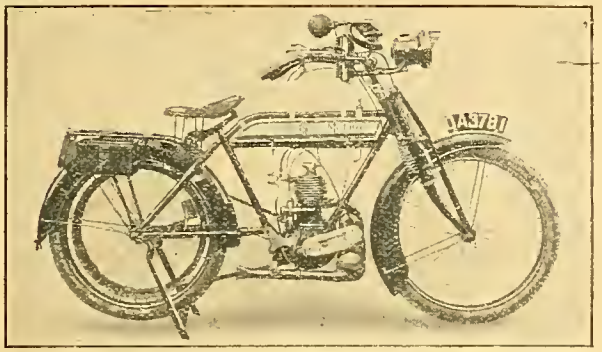


IMPERIAL METRO.

Engine . . 2½ h.p., 269 c.c., two-stroke.
Ignition . . Ruthardt magneto, chain-driven.
Carburetter . Amac.
Change Speed . Single-speed or two-speed counter-shaft, 5½ and 10 to 1.
Transmission . Belt or chain and belt.
Dimensions . Height of saddle from ground, 30in. Ground clearance, 8in.
Lubrication . Oil mixed with petrol.
Other Features. Druid or Brampton's Biflex spring forks.
Price . . 30 guineas. Two-speed model, £38 10s.

METRO MFG. AND ENG. CO., Adderley Road, Saltley, Birmingham.

* * *

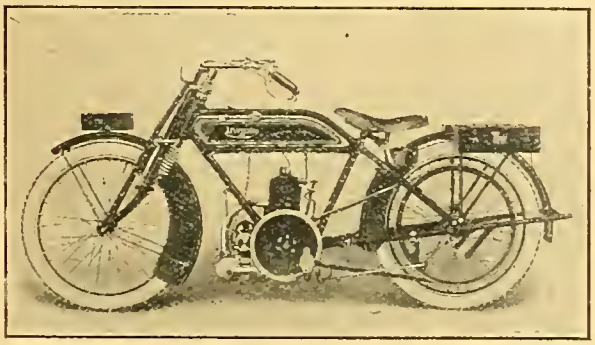


INVICTA.

Engine . . 2½ h.p. two-stroke, 269 c.c.
Ignition . . U.H. magneto, chain-driven.
Carburetter . Senspray.
Change Speed . Single-speed, 5½ to 1.
Two-speed Jardine gear, 5½ and 8¾ to 1.
Transmission . Belt or chain and belt.
Dimensions . Height of saddle from ground, 26in. Ground clearance 4in. Wheelbase, 48½in.
Lubrication . Oil mixed with petrol.
Other Features. Druid forks.
Price . . Single-speed, 28 guineas. Two-speed, 35 guineas.

A. BARNETT AND CO., West Orchard, Coventry.

* * *

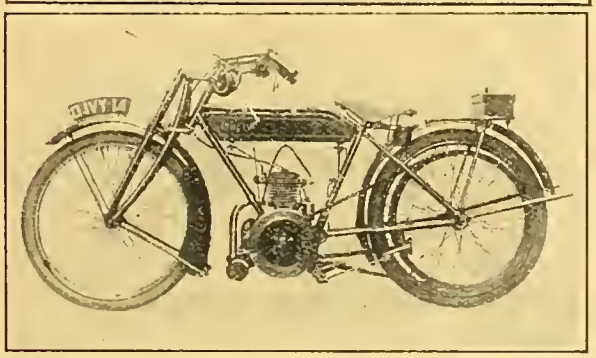


IVY.

Engine . . 2¼ h.p. two-stroke, 224 c.c.
Ignition . . U.H. magneto, chain-driven.
Carburetter . Senspray.
Change Speed . Two-speed counter-shaft or S.-A. three-speed hub.
Transmission . Ivy belt or Renold chain and Ivy belt.
Dimensions . Height of saddle from ground, 29in. Ground clearance, 6in. Wheelbase, 50in.
Lubrication . Oil mixed with petrol.
Other Features. Dunlop 2in. tyres. Weight, 100 lb.
Price . . £26 5s. fixed engine. £31 10s. two-speed. £36 5s. three-speed.

S. A. NEWMAN, LTD., Ivy Motor Works, Aston Cross, Birmingham.

* * *

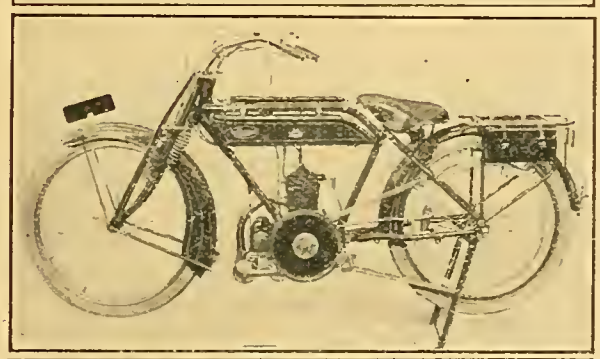


IXION.

Engine . . 2½ h.p. two-stroke, 269 c.c.
Ignition . . U.H. magneto, chain-driven.
Carburetter . Amac.
Change Speed . Counter-shaft two-speed, gears 5½ to 1 and 10 to 1.
Transmission . Chain and belt or belt.
Dimensions . Height of saddle from ground, 30in. Ground clearance, 6in. Wheelbase, 51in.
Lubrication . Oil mixed with petrol.
Other Features. Druid forks. Continental tyres.
Price . . Fixed gear, £26 5s. Two-speed, £32 10s.

IXION MOTOR MFG. CO., Great Tindal Street, Ladywood, Birmingham.

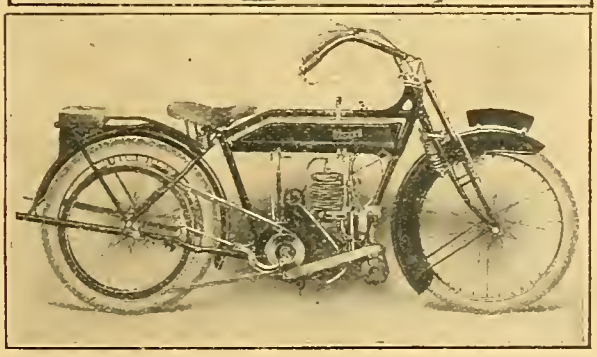
* * *

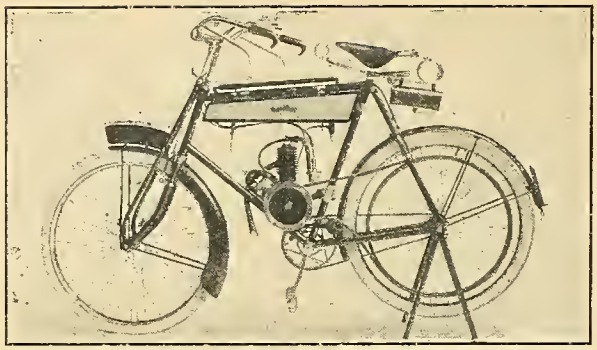


JAMES.

Engine . . 2¼ h.p. two-stroke, 226 c.c.
Ignition . . Bosch magneto.
Carburetter . Senspray.
Change Speed . Counter-shaft two-speed, 5½ and 10 to 1.
Transmission . Chain and belt.
Dimensions . Height of saddle from ground, 28in. Ground clearance, 5in.
Lubrication . Forced feed to main bearings and oil in petrol.
Other Features. Druid forks, enclosed driving chain.
Price . . 35 guineas.

JAMES CYCLE CO., LTD., Greet, Birmingham.



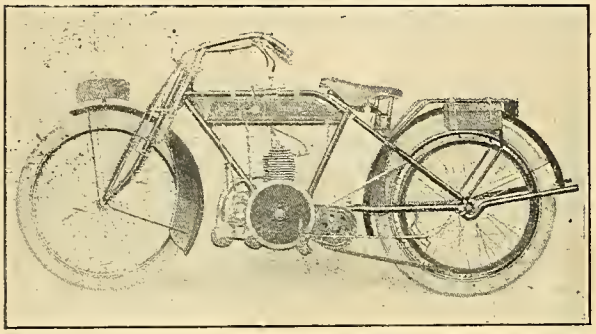


J.E.S.

Engine	1 h.p., 2in. × 2¼in. four-stroke, 116 c.c.
Ignition	Fischer magneto, gear-driven.
Carburetter	J.E.S., single lever.
Transmission	Belt.
Dimensions	Ground clearance, 6in. Wheelbase, 43in.
Lubrication	Hand pump.
Price	20, 22, and 23 guineas.
Other Models	Attachments to fit to push cycles, 12 and 14 guineas.

J. E. Smith, the J.E.S. Motor Works, Gloucester.

* * *

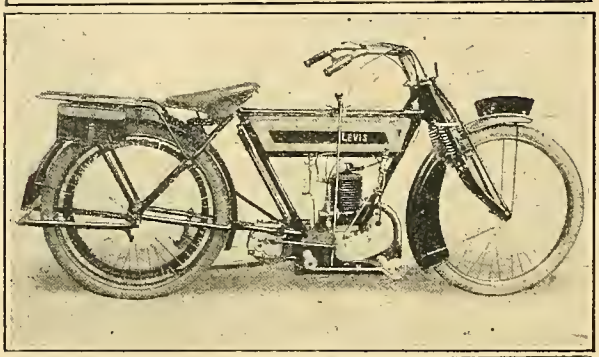


JUNO.

Engine	2½ h.p. two-stroke Villiers, 269 c.c.
Ignition	U.H. magneto.
Carburetter	B. and B.
Change Speed	Single-speed or two-speed counter-shaft.
Transmission	Belt.
Dimensions	Height of saddle from ground, 31in. Ground clearance, 6½in. Wheelbase, 52in.
Lubrication	Oil mixed with petrol.
Other Features	Druid forks.
Price	£26 5s. and £33.

Metropolitan Machinists' Co., Ltd., 248, Bishopsgate, E.C.

* * *

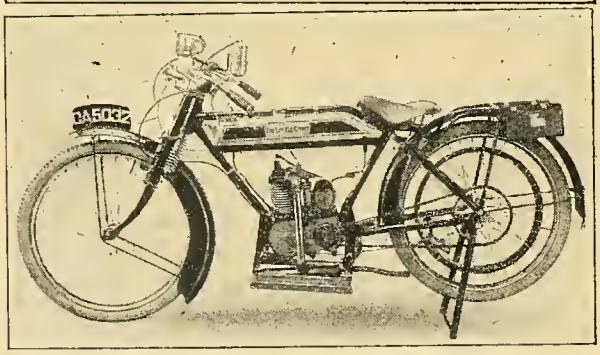


LEVIS.

Engine	2½ h.p. two-stroke, 293 c.c.
Ignition	Bosch magneto, chain-driven.
Carburetter	Amac or Senspray.
Change Speed	Single-geared, all belt drive. Albion two-speed, 5½ and 10 to 1.
Transmission	Belt or chain and belt.
Dimensions	Height of saddle from ground, 29½in. Ground clearance, 4½in. Wheelbase, 50in.
Lubrication	Levis system, semi-automatic.
Other Features	Druid forks. Large tank.
Price	£38 10s. Two-speed, £45.
Other Models	Baby Levis, 211 c.c., single-gear, £33 10s.

Butterfields, Ltd., Stechford, Birmingham.

* * *

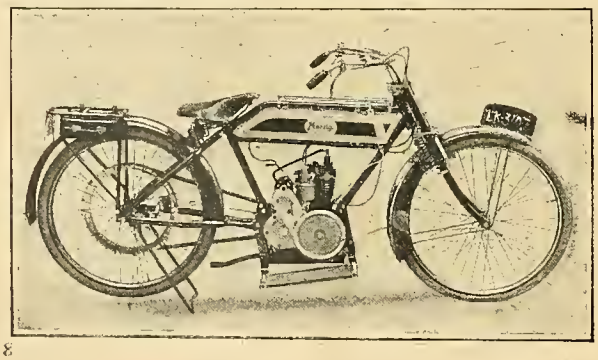


LITTLE GIANT.

Engine	2 h.p. two-speed Precision unit, four-stroke.
Ignition	U.H. magneto, chain-driven.
Carburetter	B. and B. or Amac.
Change Speed	Two-speed gear in crank case, gears from 7 to 25 to 1.
Transmission	Belt or chain
Dimensions	Height of saddle from ground, 28in. Ground clearance, 4in. to 8in. Wheelbase, 52in.
Lubrication	Hand pump.
Other Features	Druid forks. Hutchinson tyres. Weight about 110 lb.
Price	25 to 30 guineas.

Little Giant Motocyclette Co., 101, High Street, Uxbridge

* * *



MARTIN.

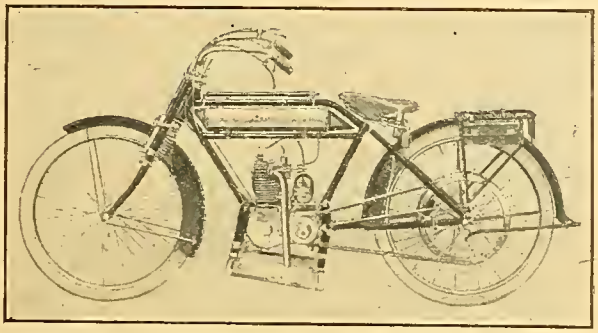
Engine	2 h.p. four-stroke, overhead valves.
Ignition	U.H. magneto, enclosed chain drive.
Carburetter	B. and B.
Change Speed	Two-speed, incorporated in crank case, gears 6 to 1 and 20 to 1.
Transmission	Gear and belt.
Dimensions	Height of saddle from ground, 29in. Ground clearance, 5in. Wheelbase, 49in.
Lubrication	Hand pump.
Other Features	Druid forks. Pedley belt. Michelin tyres 26 × 2.
Price	25 guineas.

Cars and Motor Sundries, Ltd. (Martin Dept.), 175 Shaftesbury Avenue, London, W.C.

MEAD.

Engine . . 2 h.p. Mead-Precision, 60 mm.×60 mm., 170 c.c., four-stroke.
Ignition . . Eisemann magneto, chain-driven.
Carburetter . Amac.
Change Speed . Two-speed gear, incorporated in power unit, 6 and 12 to 1 to 8 and 16 to 1.
Transmission . Pedley belt.
Dimensions . Height of saddle from ground, 29½in. Ground clearance, 4½in. Wheelbase, 50in.
Lubrication . Hand pump, enclosed in tank.
Other Features. Druid forks. 26×1¾ Michelin tyres.
Price . . 25 guineas.

MEAD CYCLE CO., 11-13, Paradise Street, Liverpool.

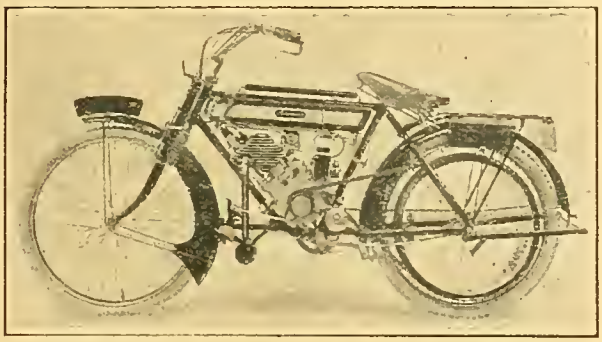


* * *

MOTOSACOCHE.

Engine . . 2½ h.p. M.A.G. four-stroke.
Ignition . . Bosch magneto, gear-driven.
Carburetter . Motosacoche.
Change Speed . Infinitely variable, between 5 and 9 to 1.
Transmission . Belt.
Dimensions . Height of saddle from ground, 30in. Ground clearance, 8in. Wheelbase, 50in.
Lubrication . Splash.
Other Features. Druid forks.
Price . . Fixed gear and free engine, 30 guineas. Change-speed gear and free engine, 34 guineas.

MOTOSACOCHE, LTD., Dumont Works, Willesden Junction, N.W.

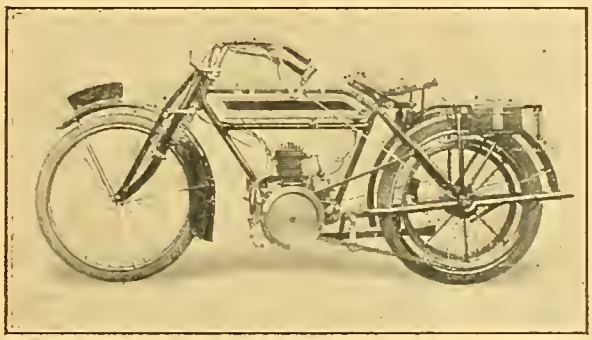


* * *

NEW COMET.

Engine . . Two-stroke, 210 c.c.
Ignition . . U.H. magneto.
Carburetter . Senspray.
Change Speed . Two-speed counter-shaft (extra).
Transmission . Belt or chain and belt.
Dimensions . Height of saddle from ground, 29½in. Ground clearance, 5½in. Wheelbase, 50½in.
Lubrication . Oil pumped into petrol.
Other Features. Druid forks.
Price . . £25 and £28.
Other Models . Two-stroke engine, 350 c.c., £33 to £41 10s.

A. H. HADEN, Princip Street, Birmingham.

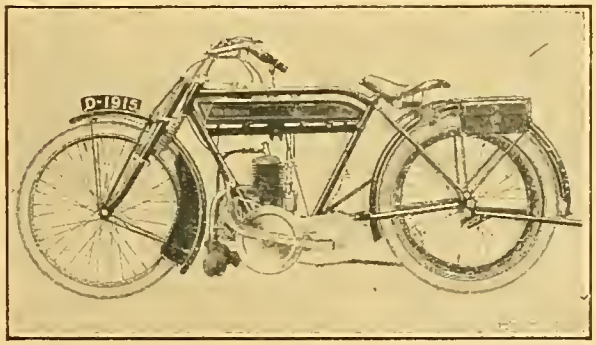


* * *

NEW HUDSON.

Engine . . 2¼ h.p. two-stroke New Hudson, 62×70 mm., 211 c.c.
Ignition . . Bosch magneto, chain-driven.
Carburetter . B. and B.
Change Speed . Counter-shaft two-speed, 5 and 9 to 1.
Transmission . Chain and belt.
Dimensions . Height of saddle from ground, 28½in. Ground clearance, 4in. Wheelbase, 51in.
Lubrication . Automatic drip-feed.
Other Features. Druid forks. Aluminium footboards. 5in. mudguard to rear wheel.
Price . . Model D, £37 10s. Model C, £33.
Other Models . Similar machines, single-geared, belt-driven, £27 5s. and £31 10s.

NEW HUDSON CYCLE CO., Summer Hill Street, Birmingham.

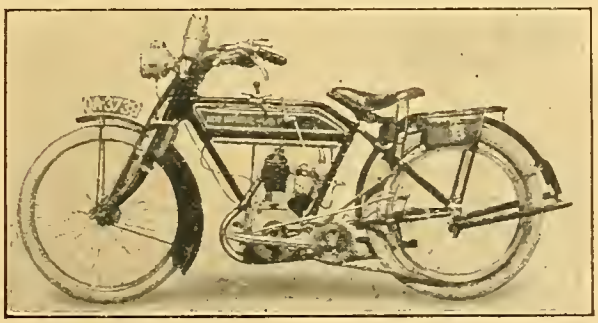


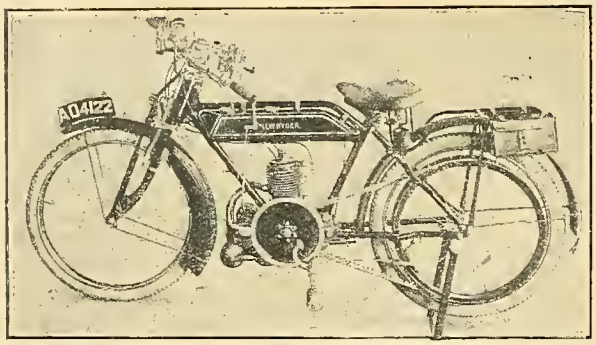
* * *

NEW IMPERIAL.

Engine . . 2½ h.p. four-stroke J.A.P., 292 c.c.
Ignition . . Bosch magneto.
Carburetter . Amac or B and B.
Change Speed Two-speed counter-shaft, gears 6 and 11½ to 1.
Transmission . Chain and belt.
Dimensions . Height of saddle from ground, 30in. Ground clearance, 6½in. Wheelbase, 4ft. 6in.
Lubrication . Hand pump.
Other Features. Druid spring forks.
Price . . 31 guineas.

NEW IMPERIAL CYCLES, LTD., Princip Street, Birmingham.



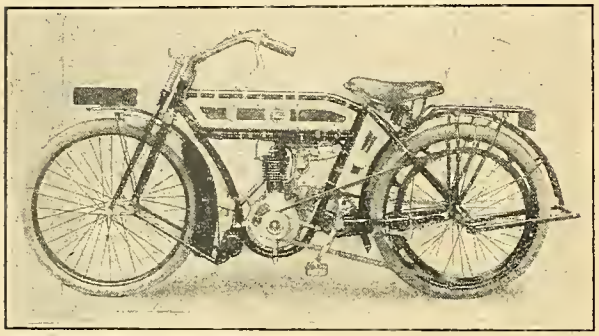


NEW RYDER.

Engine	2½ h.p. two-stroke Villiers, 269 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Amac or Senspray.
Change Speed	Two-speed in counter-shaft or Armstrong three-speed hub.
Transmission	Chain and belt or Dunlop belt only.
Dimensions	Height of saddle from ground, 29in. Ground clearance, 7in. Wheelbase, 55in.
Lubrication	Oil mixed with petrol.
Other Features	Saxon or Druid forks. Hutchinson tyres, 26×2.
Price	Fixed gear, £26 5s. Two-speed, £32 5s. Three-speed, £36.
Other Models	Semi T.T. and lady's machine.

NEW RYDER Co., Corporation Street, Birmingham.

* * *

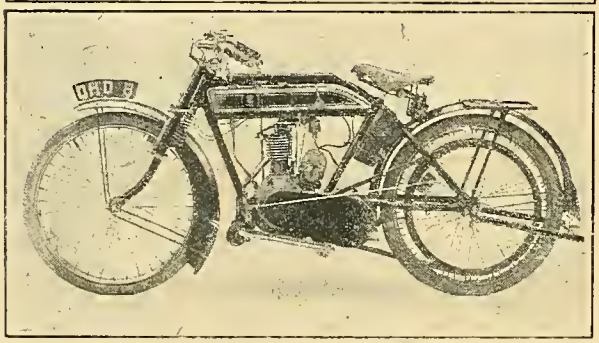


N.S.U.

Engine	2 h.p. single-cylinder four-stroke, 58×72 mm., 190 c.c., overhead inlet valve.
Ignition	High-tension magneto, gear-driven.
Carburetter	N.S.U., dual controlled.
Change Speed	N.S.U. engine-shaft two-speed gear and free engine, gears 6½ and 9¾ to 1.
Transmission	⅝in. rubber belt.
Dimensions	Height of saddle from ground, 30½in. Engine clearance, 5½in. Wheelbase, 51in.
Other Features	Hoop frame. N.S.U. spring forks. 26in.×2in. Continental tyres.
Price	With adjustable pulley, £31. With two-speed gear and free engine, £36.

N.S.U. MOTOR Co., LTD., Enesu Works, Grange Road, Willesden Green, London, N.W.

* * *

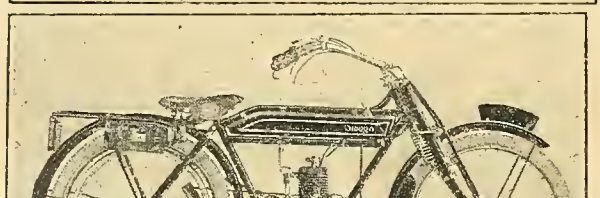


O.K. JUNIOR.

Engine	2 h.p. four-stroke, 58×72 mm., 190 c.c.
Ignition	Ruthardt magneto, gear-driven.
Carburetter	Amac.
Change Speed	Counter-shaft two-speed, 6¾ and 11½ to 1.
Transmission	Chain and belt.
Dimensions	Height of saddle from ground, 29in. Ground clearance, 9in. Wheelbase, 53in.
Lubrication	Gravity feed.
Other Features	Druid forks.
Price	£30.

HUMPHRIES AND DAWES, LTD., Birmingham.

* * *

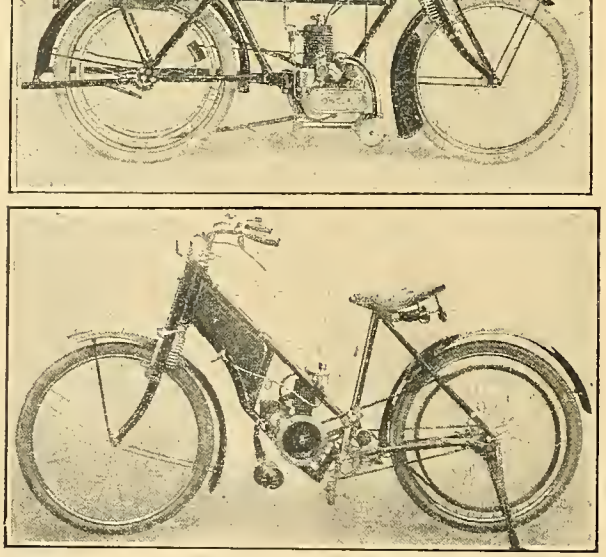


OMEGA.

Engine	3 h.p. two-stroke, 344 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	B. and B.
Change Speed	Toroga two-speed, 5 and 10 to 1.
Transmission	Belt and chain.
Dimensions	Height of saddle from ground, 30in. Ground clearance, 5¼in. Wheelbase, 48in.
Lubrication	Oil mixed with petrol.
Other Features	Druid forks. Semi T.T. bars.
Price	36 guineas.

W. J. GREEN AND Co., Omega Works, Coventry.

* * *



PACER.

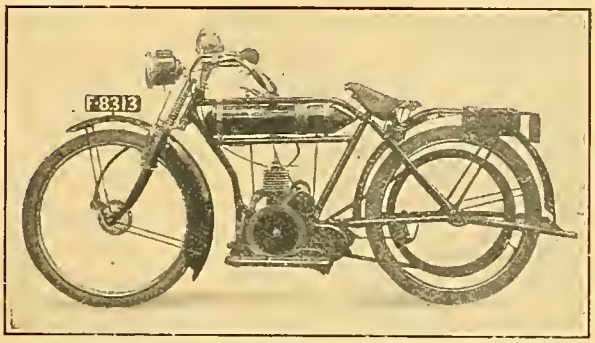
Engine	1 h.p. J.E.S. unit four-stroke, 116 c.c.
Ignition	Fischer magneto, gear-driven.
Carburetter	Amac.
Transmission	Belt.
Dimensions	Height of saddle from ground, to order.
Lubrication	Hand pump.
Other Features	Druid spring forks. Weight from 60 lb.
Price	23 guineas.

K. MILLARD AND Co., Bosq Lane, Guernsey.

PARAGON.

Engine	2¼ h.p. two-stroke, 64×70 mm., 237 c.c.
Ignition	U.H. magneto, chain drive, enclosed.
Carburetter	Amac.
Change Speed	Paragon counter-shaft two-speed gear box, 5½ to 1 and 11 to 1.
Transmission	Enclosed chain and Pedley belt.
Dimensions	Height of saddle from ground, 28in. Ground clearance, 7in. Wheelbase, 50in.
Lubrication	Oil mixed with petrol, half a pint to gallon ratio.
Other Features	Radco forks. Michelin tyres, 26in.×2in. Torpedo tank, holds one gallon.
Price	£28.

PORTWAY-COOPER MFG. CO., Brantham, Manningtree, Essex.

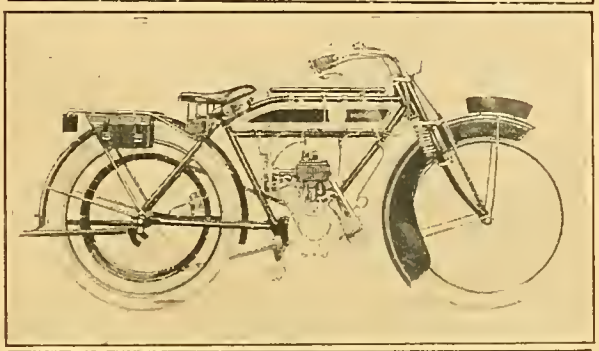


* * *

PREMIER.

Engine	2½ h.p. four-stroke Premier, 66×72 mm., 246 c.c.
Ignition	Bosch magneto, gear-driven.
Carburetter	B. and B.
Change Speed	Three models, single-gear, single-gear clutch, three-speed Armstrong hub.
Transmission	Belt.
Dimensions	Height of saddle from ground, 30in. Ground clearance, 6in. Wheelbase, 50in.
Lubrication	Splash.
Other Features	Druid forks. Clincher tyres.
Price	£36. Clutch, £42. Three-speed, £44 15s.

PREMIER CYCLE CO., LTD., Coventry.

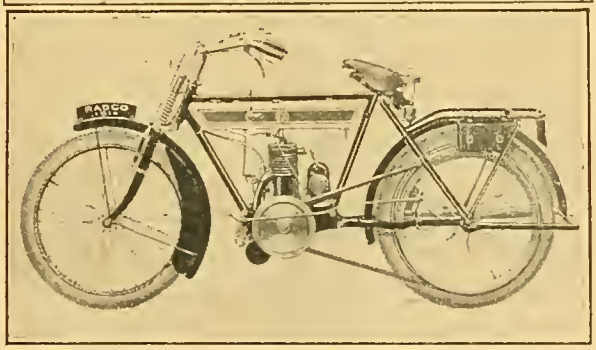


* * *

RADCO.

Engine	2¼ h.p. two-stroke, 211 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Amac, h.b. control.
Change Speed	Counter-shaft two-speed, 6½ and 9¾ to 1.
Transmission	Chain and belt.
Dimensions	Height of saddle from ground, 32in. Ground clearance, 6in.
Lubrication	Oil mixed with petrol (1 to 16).
Other Features	Radco buffer spring forks.
Price	30 guineas. Single-speed, 23 guineas.

E. A. RADNALL AND CO., Vauxhall Works, Dartmouth Street, Birmingham.

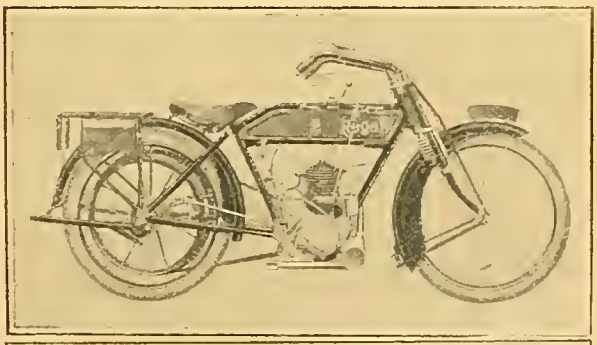


* * *

REGAL-PECO.

Engine	2¾ h.p. two-stroke, 349 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Senspray.
Change Speed	Sturmey-Archer three-speed or counter-shaft two-speed.
Transmission	Belt or chain and belt.
Dimensions	Height of saddle from ground, 27½in. Ground clearance, 5¾in. Wheelbase, 52in.
Lubrication	Best and Lloyd drip-feed.
Other Features	Extra strong frame, suitable for sidecar work if required.
Price	Three-speed, £45. Two-speed, £42. Single-speed, £35.

REGAL MOTORS, Saltley, Birmingham.

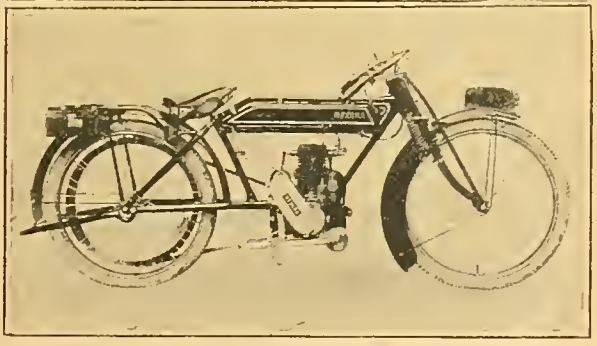


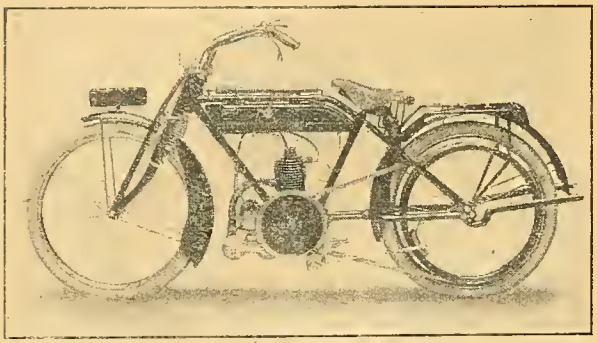
* * *

REGINA.

Engine	2¾ h.p. two-stroke, 292 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Amac.
Change Speed	Counter-shaft two-speed, gears 5 to 1 and 9 to 1.
Transmission	Chain and belt.
Dimensions	Height of saddle from ground, 26in. Ground clearance, 6in. Wheelbase, 52in.
Lubrication	Oil mixed with petrol.
Other Features	Druid forks (girder).
Price	Single-speed, £26 10s. Two-speed, £33.

S. BARNETT, Pelham Street, Derby



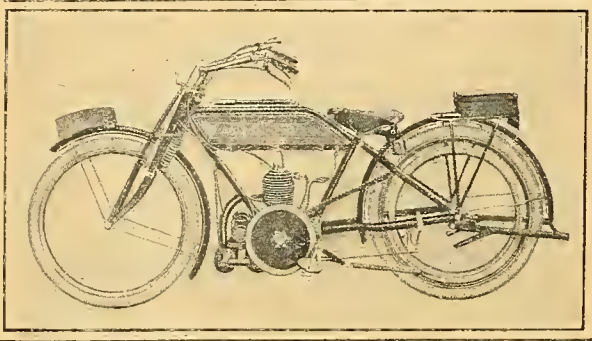


ROULETTE.

Engine	2½ h.p. two-stroke Villiers, 269 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Amac or B. and B.
Change Speed	Albion counter-shaft two-speed, gears 5½ and 10 to 1.
Transmission	Chain and belt or belt.
Dimensions	Height of saddle from ground, 30in. Ground clearauce, 6in. Wheelbase, 50in.
Lubrication	Oil mixed with petrol.
Other Features	Druid forks. Dunlop 26×2 tyres.
Price	Two-speed, £33. Single-speed, £26 5s.

ROULETTE CYCLE CO., 84, Gosford Street, Coventry.

* * *

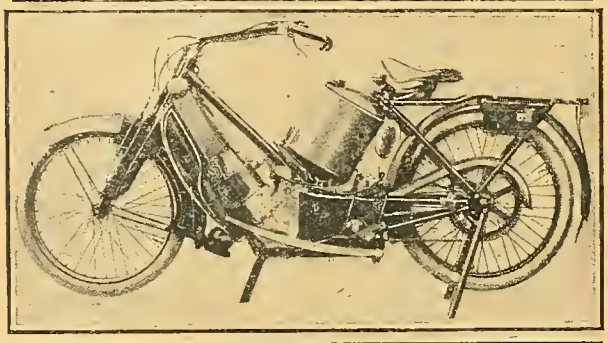


ROYAL RUBY.

Engine	2½ h.p. two-stroke, 269 c.c.
Ignition	U.H. magneto, chain-driven.
Carburetter	Amac.
Change Speed	Albion two-speed in counter-shaft.
Transmission	Chain and belt or belt.
Dimensions	Height of saddle from ground, 27in. Ground clearance, 5½in. Wheelbase, 49in.
Lubrication	Oil mixed with petrol.
Other Features	Druid forks.
Price	31 guineas. Single-speed, 25 guineas.
Other Models	2½ h.p. J.A.P., 292 c.c., 30 guineas and 36 guineas.

ROYAL RUBY CYCLE CO., Manchester.

* * *

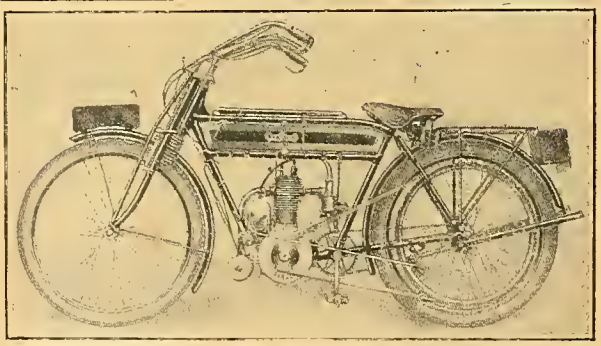


SCOTT.

Engine	3¾ h.p. two-stroke, water-cooled, 532.5 c.c.
Ignition	Bosch magneto, chain-driven.
Carburetter	Scott semi-automatic.
Change Speed	Counter-shaft two-speed, gears 4⅛ and 7.6 to 1.
Transmission	Chain.
Dimensions	Height of saddle from ground, 29½in. Ground clearance, 5in. Wheelbase, 53in.
Lubrication	Best and Lloyd sight-feed lubricator.
Other Features	Open frame. Palmer cord 26×2½ tyres. Scott spring forks and footboards.
Price	£68 5s.

SCOTT ENGINEERING CO., LTD., Saltaire, Shipley, Yorks.

* * *



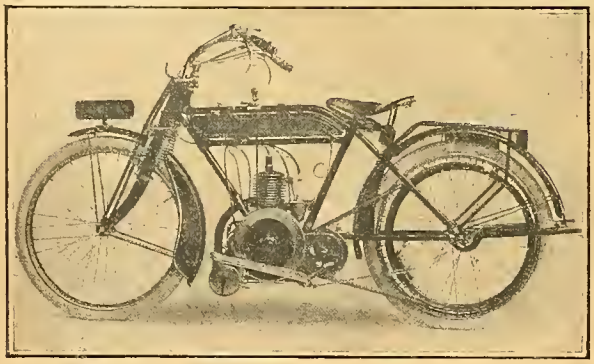
SINGER.

Engine	2½ h.p. four-stroke, 299 c.c.
Ignition	Bosch magneto, chain-driven.
Carburetter	B. and B.
Dimensions	Height of saddle from ground, 30in. Ground clearance, 4in. Wheelbase, 50½in.
Other Features	Druid spring forks.

SINGER AND CO., LTD., Coventry.

This model will shortly be replaced by a similar machine having a two-stroke 2¾ h.p. engine, 349 c.c.; counter-shaft two-speed gear, 5 and 9.5 to 1; and drip feed lubrication to cylinder.

* * *



SUN.

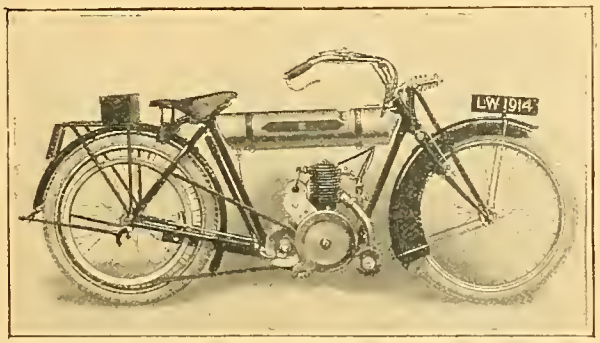
Engine	2½ h.p. two-stroke Vitesse, 269 c.c.
Ignition	Bosch magneto.
Carburetter	Senspray.
Change Speed	Counter-shaft two-speed, slipping clutch, 5½ and 10 to 1.
Transmission	Chain and belt.
Dimensions	Height of saddle from ground, 28in. Ground clearance, 7½in. Wheelbase, 52in.
Lubrication	Drip feed.
Other Features	Druid forks. Roman rims to order. Dunlop tyres.
Price	£35 10s.
Other Models	Sun-Villiers, 2½ h.p., 269 c.c., £34 10s.

SUN CYCLE AND FITTINGS CO., LTD., Aston Brook Street, Birmingham.

TRIUMPH.

Engine . . 2¼ h.p. two-stroke, 225 c.c.
Ignition . . Bosch magneto, chain running in aluminium case.
Carburetter . Triumph, semi-automatic, variable jet.
Change Speed . Counter-shaft two-speed, handle-bar control, 40% reduction from high to low.
Transmission . Chain and belt.
Dimensions . Height of saddle from ground, 28½in. Ground clearance, 4½in. Wheelbase, 48in.
Lubrication . Oil mixed with petrol.
Other Features. Triumph spring forks. 24in.×2in. studded tyres. Weight 125 lb.
Price . . £42.

TRIUMPH CYCLE CO., LTD., Coventry.

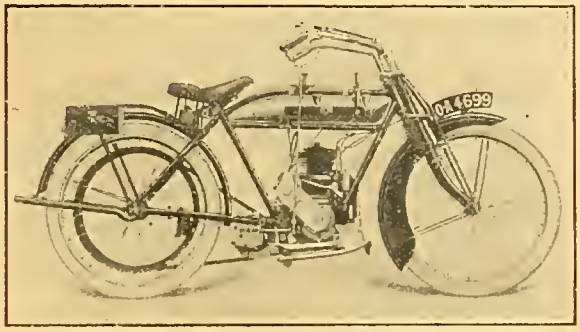


* * *

TRUMP.

Engine . . 2¾ h.p. two stroke Peco, 75×79 mm., 349 c.c.
Ignition . . U.H.-magneto, chain-driven.
Carburetter . Amac or Senspray.
Change Speed . Albion two-speed in counter-shaft, 5 and 9½ to 1.
Transmission . Chain and belt.
Dimensions . Height of saddle from ground, 30½in. Ground clearance, 5in. Wheelbase, 53in.
Lubrication . Best and Lloyd drip feed.
Other Features. Druid forks, wide, to take 3½in. mudguards.
Price . . Single-gear, £37 10s. Albion two-speed, £45. Three-speed, £47 10s.

TRUMP MOTORS, LTD., 70, Lombard Street, Birmingham.

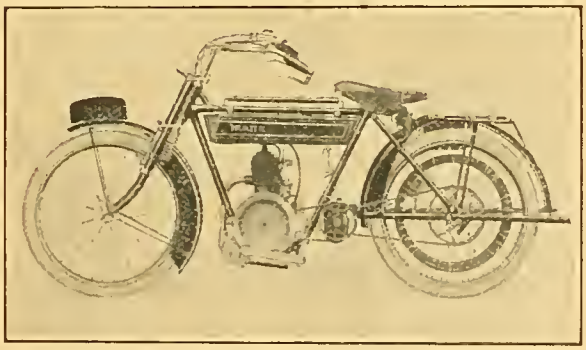


* * *

VELOCETTE.

Engine . . 2½ h.p. two-stroke, 220 c.c.
Ignition . . U.H. or Bosch.
Carburetter . Amac or Senspray.
Change Speed . Counter-shaft two-speed, 6 to 1 and 11½ to 1.
Transmission . Chain.
Dimensions . Height of saddle from ground, 28in. Ground clearance, 6½in. Wheelbase, 49in.
Lubrication . Oil in sump, patent system, automatic.
Other Features. Druid forks. Footboards.
Price . . £31 10s. Ladies' model, £33 12s. Single-gear and belt drive, £26 5s.

VELOCE, LTD., Fleet Street, Birmingham.

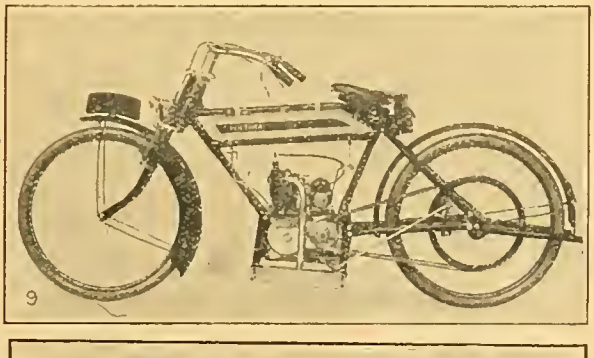


* * *

VICTORIA.

Engine . . 2 h.p. four-stroke, 170 c.c.
Ignition . . U.H. magneto.
Carburetter . Amac.
Change Speed . Two-speed gear, contained in crank case.
Transmission . Dunlop ⅜in. belt.
Dimensions . Height of saddle from ground, 29in. Ground clearance, 5½in. Wheelbase, 52in.
Lubricotion . Force feed oil pump.
Other Features. Druid forks. Dunlop tyres, 26×2.
Price . . 25 guineas.
Other Models . 2½ h.p. Villiers two stroke engine, 269 c.c., 25 guineas.

VICTORIA MOTOR AND CYCLE CO., LTD., Dennistoun, Glasgow.

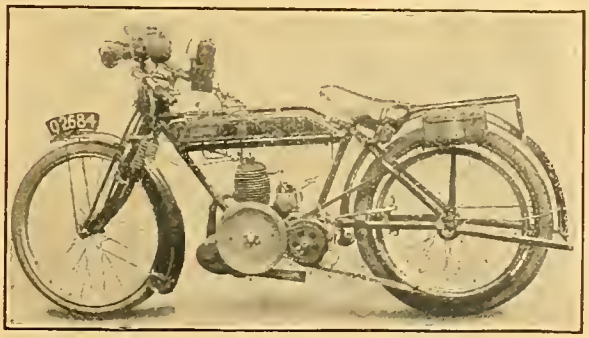


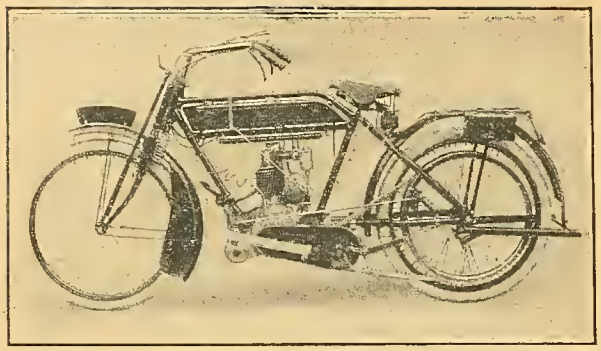
* * *

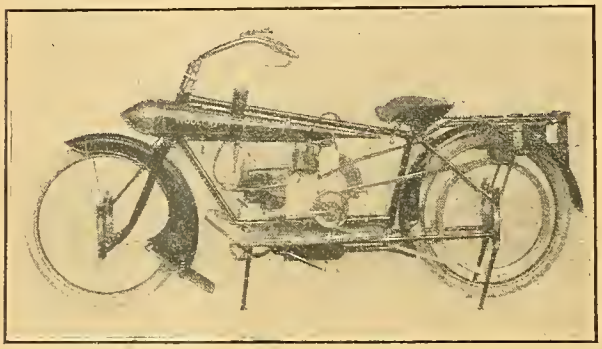
WIZARD.

Engine . . 2½ h.p. two-stroke, 269 c.c.
Ignition . . U.H. magneto, chain-driven.
Carburetter . Amac or Senspray.
Change Speed . Fixed gear or Albion two-speed.
Transmission . Chain and belt.
Dimensions . Height of saddle from ground, 30in. Ground clearance, 6in. Wheelbase, 50in.
Lubrication . Oil mixed with petrol.
Other Features. Druid forks. Avon or Hutchinson tyres.
Price . . 25 guineas single-speed. 33 guineas two-speed.

F.B. TWO-STROKE CO., 32, Coventry Road, Hay Mills, Birmingham.







WOLF.

Engine	2½ h.p. four-stroke Wolf, 76×64 m.m., 298 c.c.
Ignition	U.H. or Bosch magneto.
Carburetter	Senspray or Amac.
Change Speed	Counter-shaft two-speed gear.
Transmission	Chain and belt.
Dimensions	Height of saddle from ground, 29in. Ground clearance, 6in. Wheelbase, 54in.
Lubrication	Hand pump.
Other Features	Pilot spring forks. Kick starter.
Price	Single gear, 24 guineas. Two-speed gear, 30 and 32 guineas.

Wulfruna Engineering Co., Ltd., Wolverhampton.

* * *

WOOLER.

Engine	2¾ h.p. two-stroke Wooler, 76×76 mm., 344 c.c.
Ignition	U.H. magneto.
Carburetter	B. and B.
Change Speed	Expanding pulley, gears 4½ to 7¾ to 1.
Transmission	Belt.
Dimensions	Height of saddle from ground, 23in. Crank case clearance, 11in. Wheelbase, 63in.
Lubrication	Forced by pump.
Other Features	Displacer instead of crank case compression, sprung back and front.
Price	45 guineas.

Wooler Eng. Co., Ltd., Old Oak Lane Common, Willesden.

TYPES OF DEFLECTORS.

SPECIMENS OF TWO-STROKE PISTON HEAD DESIGN.

Fig. 1.

Fig. 2.

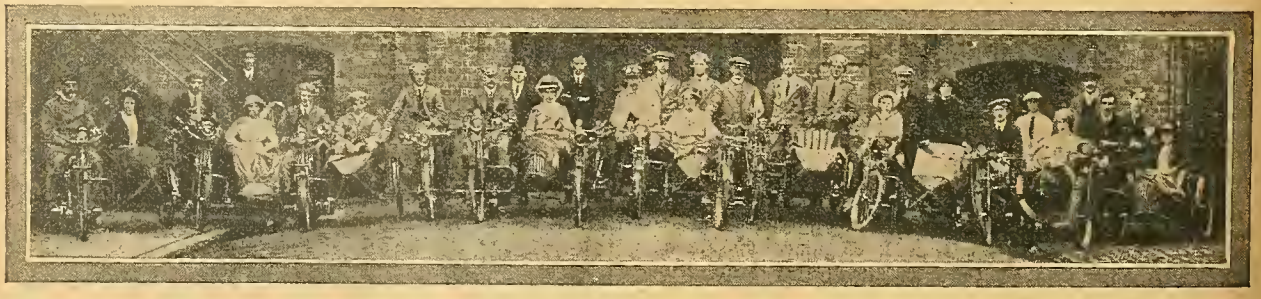
Fig. 3.

Fig. 4.

Fig. 5.

Fig. 6.

THE sketches herewith show a few types of gas deflectors on the piston heads of small two-stroke engines and serve to demonstrate the wide divergence of opinion as to the correct shape. No. 1 shows what is perhaps the most common shape, and No. 2 is more frequently found on comparatively low-speed engines. No. 3 is a combination of the two previous types, and is to be found on at least one very successful machine. The flat face of No. 4 is unusual, though the manufacturers claim great efficiency. No. 5, with slight modifications, is perhaps the most common form after No. 1, and No. 6 shows a deflector used on a well-known machine which we believe has been considerably modified lately. The object of a deflector is, of course, to separate as far as possible the burnt gases from the fresh charge entering the cylinder. Were the piston head flat as in the usual four-stroke practice, there would be much wastage, owing to the fresh charge blowing out of the exhaust port. Thus it will be seen that the shape of the deflector has an important bearing on scavenging, gas wastage, and piston distortion, and needs careful consideration in design, but at its best it is in some measure a compromise, for in the ideal engine the shape would alter for every variation of the throttle opening and engine speed. This introduces a problem in design which is likely to take some solving, but in the meantime some of the present types of deflector are so satisfactory that the lack of a variable piston head is not likely to affect the progress of the two-stroke movement. Developments in this respect will be watched with interest.



Group of members of the Banbury M.C.C., who visited the Rover Company's works last week and were later entertained to tea. The General Manager of the Company, Mr. J. K. Starley, suggests that this might form a pleasant afternoon's outing for other Midland clubs.

Three Guineas is the price of the wonderful new

Stewart

MOTOR-CYCLE SPEEDOMETER

And for that three guineas is given invaluable information and priceless pleasure which will make the transaction something very much removed from merely monetary considerations.

Every time you take your machine out, there's the speedometer measuring the distance, recording the speed. You take keener delight than ever in the increasing momentum of the Cycle, and you are better able to bring the pace down to the required limits when warned to do so. You'll be surprised how helpful it is to be able to tell at a glance the speed at which you are going.

And when you get home, there's the record of your performance—the miles you have covered on the trip, the total mileage up to date for the season. There's satisfaction in knowing these figures, and the information is of practical value also. With these figures to guide you, tyre value, petrol and oil consumption, and other running expenses can be properly checked, and economies thereby effected. So really and truly your "Stewart" instead of costing you money, saves your money.

Have the new model fixed on your Motor Cycle. It's a beauty; the best made, most reliable and most accurate speedometer yet achieved. From Zero to 75 miles, with 10,000 mile season and 100 mile trip—both repeating. Rubber covered flexible shaft.

Price £3 : 3 : 0

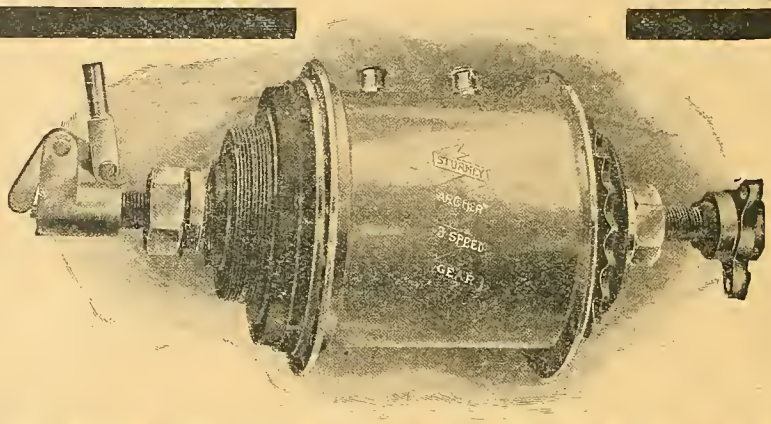
Concerning the running of the famous



STURMEY-ARCHER

3-SPEED GEAR.

"There can be absolutely nothing better in the way of gears than the Sturmey-Archer."

(See letter).

A series of unsolicited letters from delighted users of the gear on various types of Motor Cycles.

No. 1. **On a Humber.**

January 20th, 1913.

Dear Sirs,

I feel it my duty to write to congratulate you on the excellence of your 3-Speed Motor Cycle Gear. The Gear I have had on my Humber Cycle has run now without the slightest trouble since January, 1912, and has been used mostly with a Sidecar. Since I have had it I have never had to dismount at a hill, and last year I toured over Devonshire and Cornwall, and never had even to adjust it. I am sure there could be absolutely nothing better in the way of gears than the Sturmey-Archer. I have had several well-known makes of gears, both bottom bracket and hub, but none of them are quarter as good as yours.

Wishing you every success,

Chilwell, Notts. *R. NEVILLE.*

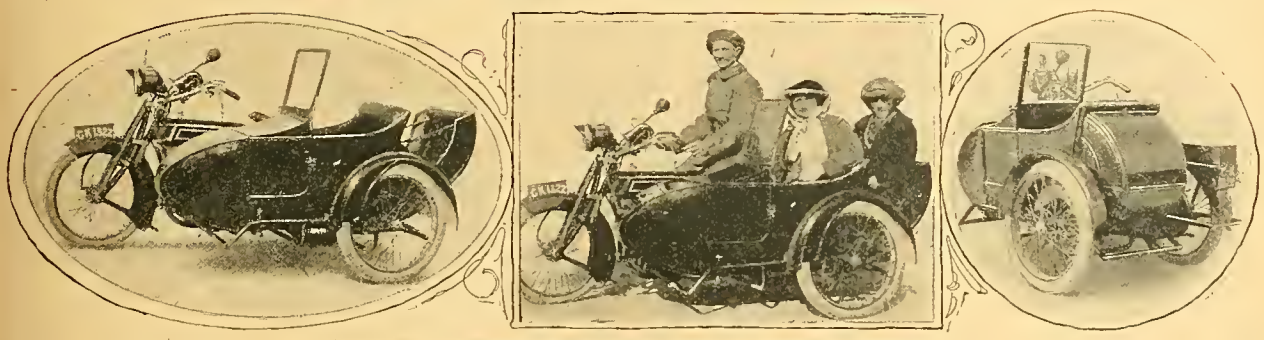
STURMEY-ARCHER GEARS, LTD.,
NOTTINGHAM.

LATEST SIDECAR DESIGNS.



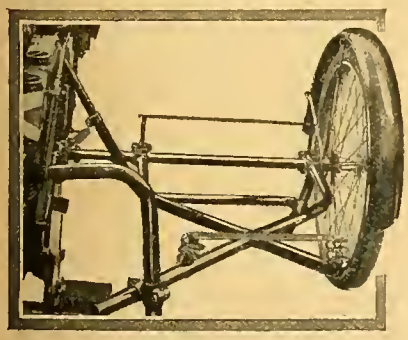
The neat two-passenger Cairns sidecar shown in different positions.

A NEW TWO-PASSENGER SIDECAR.

A very handsome sidecar with many novel features has been placed on the market by Messrs J. T. Cairns and Co., Grimshaw Street, Preston. The outstanding point of this car is the bulbous back, which when closed is neat in appearance, and forms a large compartment for luggage, and when open provides quite a roomy extra seat for an adult passenger or two children side by side. These large passenger-carrying sidecars are often apt to look rather cumbersome, but the Cairns is the very reverse, for its appearance is really graceful. The chassis appears to be very strong, and the springing good.

A SIDECAR FOR LIGHT-WEIGHTS.

In view of the enormous popularity of lightweight machines it is interesting to note that quite a number of these are being used for sidecar work. In average country and with careful driving perfectly satisfactory service can be secured from very moderate-powered outfits, but it is essential that light sidecars be fitted.

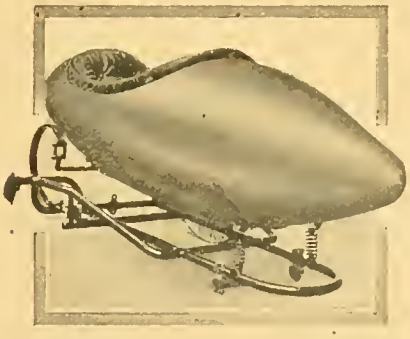


The Stokes and Holt special sidecar chassis, designed for use with lightweight motor cycles.

To this end Messrs. Stokes and Holt, Ltd., Belgrave Road, Leicester, who are large makers of sidecars, have brought out, and registered the design of, a new sidecar suitable for use with little two stroke machines. We illustrate the chassis, which, in this particular instance, was attached to a 2¼ Connaught. The price of the complete sidecar is £9 10s., and 50 lb. represents the total weight of the body and chassis combined.

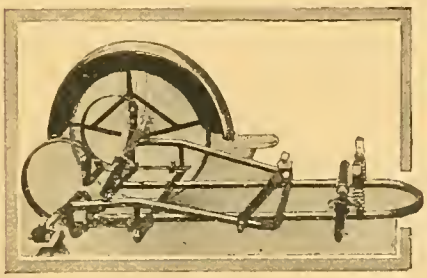
A NEW SIDETTE CHASSIS.

A sidecar embodying several interesting points is being marketed by Messrs. Sidettes, Coventry. The body is not entirely new, though it has been improved in detail. It is of torpedo shape, and is made of three-ply covered with



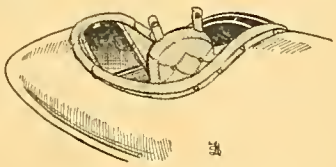
The latest form of Sidette with torpedo body. The frame joints are welded throughout.

canvas. The canvas is heavily painted and coach finished, and gives a combination of great strength and pleasing appearance. The tail of the body forms a roomy locker for tools and spares and may be reached by hinging the seat back. The body is carried by coil and C springs on a welded steel tube chassis of particularly strong construction, in the manufacture of which 14 gauge tube is used throughout except for the axle, which is of 10 gauge. Details have received careful attention, and the mudguard stay is



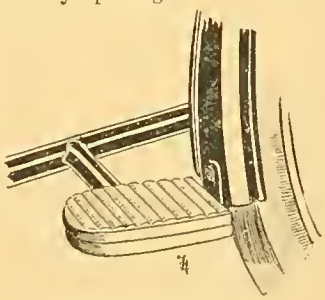
The new Sidette chassis, showing mudguard stay, mounting step, and four-point attachment.

specially strong, and just in front of the guard is an aluminium mounting plate.



Body of the Sidette, showing the seat hinged forward to provide access to the locker.

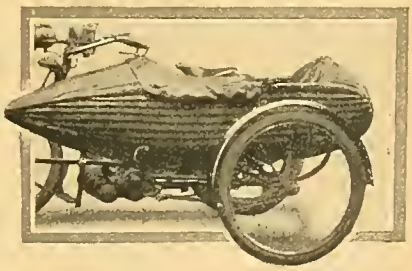
Four points of attachment are supplied, and the weight of the machine works out at about 75 lb. The outline of the sidecar is distinctly sporting.



Neat mounting step on the Sidette chassis.

A NEW LIGHT SIDECAR.

The accompanying photograph shows a new sidecar made by R. Samson, Ltd., Islington Row, Birmingham It is fitted with a specially built chassis, which

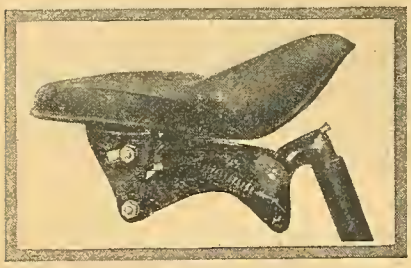


A neat design of cane sidecar body by Reg. Samson, Birmingham.

weighs only 50 lb., while the lines of the body reduce the wind resistance to a minimum.

NEW XL-ALL SADDLES.

Messrs. XL-All are placing two new saddles upon the market. The chief features are that the seat-pillar is made in one piece with the underframe, thus dispensing with the usual clip and giving the lowest riding position, and at the same time the greatest spring play.

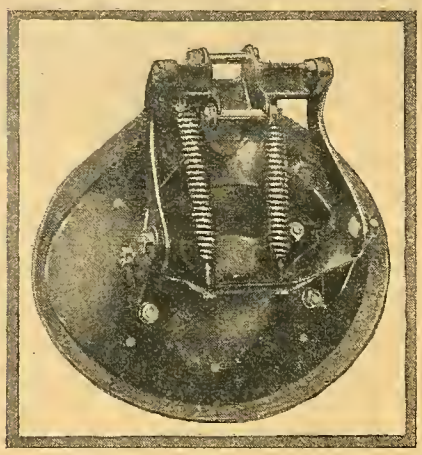


Latest Design Xl-All Saddle.

Side-rolling is prevented by the side links being made in one piece, which form the upper and lower bridge, making both members move in unison.

A unique feature is that the spring travel can be altered to suit each rider, which is as much as three inches at all points of the saddle. The springs can also be regulated to the weight of the rider. The under work is now made detachable from the pan seat, and is finished to match the colour of the various machines.

These saddles are, of course, being made to fit every type of machine, the makers having successfully overcome the difficulty of fitting the various designs of frame, and on examination of the saddles made for various machines we found that the amount of spring play had been in every case retained.



Underside of saddle showing springing.

Tyres for S.A. Police.

We learn that Messrs. W. and A. Bates, Ltd., have received a contract for two years' supplies from the Union of South Africa for their motor cycle tyres and motor car tubes for the South African police.

Climbing the Wrekin.

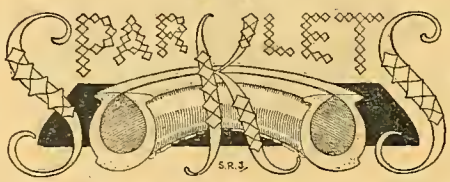
An ascent of the Wrekin, the best known hill in Shropshire, has been accomplished by Mr. Evan Pybus on a 5 h.p. Ariel and sidecar carrying a 10-stone passenger. The surface was exceedingly rough, and it is undoubtedly a praiseworthy performance to take a loaded sidecar up this hill.

Motor Cycles on Easy Payments.

Messrs. Selfridge and Co., Oxford Street, W., have sent us particulars of their easy payment system for motor cycles, which, briefly, is as follows: Any machine in stock may be obtained immediately for a deposit of one-fifth of its price; the balance may be extended over a period of twelve months, and for this added convenience 2½% only is charged.

The New Invicta Models.

Probably buyers of motor cycles would gain much information by perusing the catalogue of the Invicta motor cycles, which are sold by Messrs. A. Barnett and Co., West Orchard, Coventry. The two-stroke model is a handsome machine and is priced at twenty-five guineas. The two-speed model, with chain and belt drive, is listed at thirty-five guineas. Rubber-lined footboards can also be provided at an extra charge of 17s. 6d. The other model sold by this firm is a 3½ h.p., which can be obtained either single-geared or fitted with a three-speed Armstrong hub.



A New Golf Ball.

Many of our readers are also golf players. The County Chemical Company, Limited, are making a two-shilling golf ball, with which many successes in the royal and ancient game have been gained.

Sidecars in Scotland.

Messrs. Mead and Deakin, Rushey Lane, Tyseley, Birmingham, inform us that one of their standard model sidecars went through the Scottish Six Days Trials without any trouble whatever. It was attached to Mr. Tom Silver's Quadrant, which gained a gold medal.

A Favourite Sidecar.

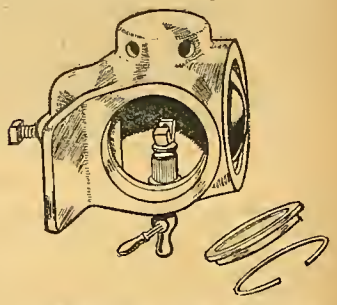
Messrs. Sydney Westall and Co., Ltd., inform us that they intend to combine their garage and sales department under one roof, and, consequently, have moved the latter to 1, Chester Street, Grosvenor Place, S.W. The firm at the present moment is very busily engaged in turning out the Scott-Westall sidecar, for which there is a very ready demand.

A Satisfactory Lubricant.

We have been using a sample of Record oil, made by the Record Oil Company, 104, Leadenhall Street, E.C., on a 3½ h.p. A.B.C. motor bicycle, which successfully carried us round the Six Days Trial course. The oil appears to be thoroughly satisfactory, it requires very little to lubricate the engine in a perfectly adequate manner, and it produces no excess of carbon deposit.

A NEAT REAR LIGHT.

We have seen and tried a large number of rear lighting outfits which have been put on the market, but we do not think we have seen anything more practical than that listed by Messrs. J. J. Eastick and Son, Clapton Common, N.E. It will be seen from the illustration that the lamp itself is very compact and is provided with a side window for illuminating the number plate. It can also be adapted for use with electricity, in which case the battery is carried in a small canvas case, which may be strapped to the carrier, and on the outside is a little switch for putting the light into operation.



A Rear Light for Motor Cycles.

A New Dirt Remover.

Messrs. Fitch, Ltd., Tamworth, have forwarded us a sample tin of a new grease and oil remover known as Grimewash, which appears to be most efficacious. It is sold in 6d. tins.

Comfort and Reliability.

Considerable interest has been aroused by the illustration in the issue of *The Motor Cycle* of July 9th of the Edmund spring frame motor cycle fitted with a 2¾ h.p. Douglas power plant. Readers will be interested to hear that Mr. Schuver, 20, Clavering Avenue, Barnes, S.W., is responsible for the production of this interesting machine.

A Change of Engines.

With reference to the necessity of a change of engines in J. L. Norton's machine before the start of the A.C.U. Six Days Trials, we are informed by Norton Motors, Ltd., that the engine used to run up to Sheffield was an experimental one, and had not been properly run in—hence the change at the last moment.

Wanted, a Name!

The County Chemical Co., Ltd., Bradford Street, Birmingham, lately introduced a new motor cycle engine-oil, which has already earned for itself an enviable reputation. This oil has not yet been officially named, and, to further this, the manufacturers have offered handsome prizes for the best name sent in. Entries for this competition close on July 31st, and those desirous of participating should write the County Chemical Co., Ltd., at once. We may add that we have tried this oil ourselves, and have found it to be admirable in all respects, and a large number of well-known riders have written the manufacturers expressing their approval of this new lubricant.

ANY of the following machines and bargains may be obtained on our Deferred Payment Plan. You secure immediate possession of the machine on payment of a deposit of one-fifth of the price. The balance is payable in twelve months, with a charge of 2½% on the balance only. If you are unable to call, write, 'phone, or wire for particulars.

Stepney Road-Grips

For Heavy Cars, Light Cars, and Motor Cycles.

Another Unsolicited Testimonial:

15, Neville Road, Liscard, Cheshire.

Dear Sirs,—I am pleased to inform you that the 700 × 80 Stepney Road-Grip Cover I have just removed from the back wheel of my Morgan has been doing service there since the end of last November. It has never once been off, never once punctured, and only once inflated. Although the mileage of the tyre is a trifle under 7,000 miles it is only now begining to show through the canvas in two places. I use my Morgan practically every day and in all kinds of weather, but I have never had to give a moment's attention to the Stepney. I will have the tyre retreaded. Had it not been for a 300/350 miles run over the worst roads in Ireland the tyre would still be good for another 1,000 miles on home roads. I am perfectly satisfied that no other tyre on the market—and I have tried most of them—could give such service. The Stepney Road-Grip was all that was required to remove the first and last objection to the Morgan from the point of view of accessibilty, viz.—the taking out of the back wheel Morgan owners have something to be thankful for, if they only knew it.

Yours faithfully,

J. McGUCKIN.

WILL GIVE GREATER MILEAGE AND BETTER GRIP THAN ANY OTHER NON-SKID TYRE.

AN OPINION OF

THE GRANDEX-PRECISION 2 H.P. PUP.

DEAR SIRS, STREATHAM, S.W.

With reference to the "Grandex Precision Pup" Motor Bicycle I bought from you about the middle of May, it might interest you to learn how completely satisfied I am with same. So far, I have travelled about 650 miles. This includes two journeys to Deal and Dover, and one to Brighton.

The hill-climbing propensities of the engine are wonderful, low gear being seldom necessary, and the speed on the level, about 30-35 m.p.h., should be quite sufficient for any ordinary motorist riding a light weight cycle. Yours truly, A. C. T.

A WELL-BUILT MASTERPIECE FOR 25 GUINEAS.

Misplaced Energy by a Cycling Body.

We understand that the Cyclists' Touring Club, which professes to cater for motor cyclists as well as cyclists, and must number among its cycling members many who are also owners of cars, has addressed a circular letter to the police authorities urging them to use greater stringency in ensuring the proper carrying out of the provisions of the Motor Car Act with respect to the legibility and illumination at night of number plates on motor vehicles; also, that the C.T.C. intends in the near future to approach the Local Government Board with a definite recommendation for the adoption of a new form of transparent number-plate in order that more effective illumination and consequent identification of motor vehicles can be secured.

Now, while we have nothing to say against the proper carrying out of the provisions of the Motor Car Act, we are of opinion that the police in most districts are quite sufficiently strict—in some parts of the country they may be said to err on the side of undue severity in their handling of what are, after all, technical offences of small importance to every one except the unfortunate individual who may be fined 40s. and costs because the coat of the passenger on the carrier hides his rear number-plate.

For the car driver who knocks down a cyclist or pedestrian and drives away leaving a fellow creature lying hurt in the road we have no excuse to offer under any circumstances; but we do think that such despicable conduct would be much more rare if the motorist could be sure of getting justice, and no more, at the hands of the authorities; but unfortunately it is often the tendency to lay the whole blame of any accident upon the motorist no matter who is really in fault, and these things are brought about by the bigoted attitude of some Benches to all things automobile, and by the conduct of certain motorists themselves, who, having no experience of the amenities of the road, drive as if the public highway was intended for them alone. It is more desirable to devise means of preventing accidents than of tracking those concerned in them when they occur, and we think that the C.T.C. would be better employed in putting its own house in order by urging upon the cycling members the use of a rear warning light at night—properly made and properly fitted—than in endeavouring to make the lot of automobilists more arduous than it is at present. If the C.T.C. is in want of new outlets for its activity may we suggest that some people regard the road as a breaking place for bottles, others as a place where they may graze their cattle, and where poultry may roam unmolested.

The Six Days Trials Course.

In our description and comments on the Six Days Trials we observed that the event developed more into a "Colonial" test, and that certain sections of roads and one or two test hills might have been omitted, but it was also made clear that the fact of fifty-one competitors gaining gold medals proved that the course, despite its severity, was not too bad for a first-rate machine.

This week we publish two letters from important firms of manufacturers who support our view that the trial, though extremely severe, was not so impossible as it has been made out to be, and reflecting upon the conditions after having ridden round practically the whole of the course on a motor bicycle, we do feel that the test arranged was just what was wanted. The trial brought out that a machine with three speeds was at an advantage, and demonstrated that the average motor cycle rim was too weak; it proved that the brakes on some machines were not so efficient as they should be, and it further found out weak spots in frame design. The A.C.U. has been subjected to much unfair criticism, and it seems that an attempt is being made to induce manufacturers to boycott A.C.U. trials in future, but surely this is petty.

IGNITION AND LIGHTING.

The Possibilities of Magneto-Dynamo Lighting for Motor Cycles and Sidecars.

In view of the increasing tendency toward electric lighting on motor cycles, the author discusses the advisability of combining the ignition and lighting systems by means of a dynamo and accumulators.

UNLESS the tendency towards electric lighting on all forms of motor vehicles suffers a very unexpected set-back in the near future, one of the results of this development may well be the re-consideration of the ignition system of motor cycles. On large cars a certain amount of extra weight and cost is not a very important matter, but on motor bicycles, sidecar combinations, and cycle cars it is obviously advisable to employ one apparatus to do dual or even triple service, provided that this can be done without appreciable loss of efficiency.

Simple Lighting Batteries.

The simple lighting installation consisting only of a small secondary battery and the necessary lamps and wires we need not consider at any length, because they have been on the market some time. Clearly, for this purpose we should carry a battery only sufficient for lighting purposes, and should not think of employing it for ignition also, since this would mean additional capacity and additional weight. When, however, the lighting system is of a more complete kind, incorporating a dynamo of suitable design, the duty of which is to keep the accumulators charged, the case is considerably altered.

The dynamo may be put to use for ignition purposes in either one of two ways. It can be wired up directly to a make and break contact working in connection with a plain induction coil, or possibly to a wipe contact working wtih a trembler coil. The ignition circuit from the dynamo would in this case be in parallel with the circuit to the lamps, and the opening and closing of the ignition circuit would tend to affect the lighting circuit to some extent, causing the current from the dynamo to ebb and flow at least to a slight degree. It is very questionable, however, whether this would constitute a serious drawback, since, with the accumulators always present to act as a kind of buffer in the lighting circuit, the effect on the lamps should not be such as to alter appreciably their illuminating power.

The other method would be to put the accumulators directly into connection with the ignition circuit, and merely to use the dynamo as a means of keeping the cells fully charged.

Dual Systems of Ignition.

In discussing possibilities not yet fully tested, it would be rash to attempt to say exactly what method of operation would prove the most efficient, but if the first were employed it would evidently be advisable to wire up so that the accumulators could be put on to the ignition circuit as an alternative to be used when starting, and in the unlikely event of anything going wrong with the dynamo. This would practically provide a dual system of ignition. At high speeds a lighting dynamo is capable of giving a voltage very much in excess of that of the ordinary four-volt accumulator, which used to be used for ignition, and consequently the spark also should be more effective.

If any of the developments hinted at actually com to pass, it is practically certain that the change i these directions will be a gradual one, very muc more gradual than was the abandonment of the igni tion accumulator in favour of the high-tension mag neto. At the time when this took place, ther was a great controversy as to the relative merits of th sparks given by the two systems. Probably, unde ideal conditions, with the ignition control set i exactly the correct position, and a thoroughly goo mixture supplied to the cylinder, there was little o no difference in the power produced as the result o employing the different ignition systems.

Magneto Spark and Gas Mixture.

When, however, any error was assumed in the set ting of the ignition lever, this error had a much mor detrimental effect on ignition by the coil and accumu lator system than upon that depending on the high tension magneto. Moreover, there is good reason t believe that the magneto deals more effectively wit mixtures of varying quality, such as may well b found in the two cylinders of a V type engine especially if the cylinders are set at a small angle Since this great change in ignition took place an little faults that there may have been in the earl high-tension magnetos have been made good, and th present machines are practically perfect.

In the matter of weight there should certainly b an advantage, since the various components of th ignition lighting sets would balance one another fairl well, with the exception of the dynamo, the whole o which might be regarded as part of the electric ligh ing outfit, leaving the magneto with its heavy fiel magnets to be weighed against an induction coil mor comparable with the armature alone than with th whole machine. On the other hand, the attempt t keep down weight might easily be over-valued, sinc it is apparent that very many motor cyclists at th present moment are quite willing to add weight b carrying small lighting accumulators not absolutel essential.

Another factor which will tend to make the chang slow, if it occur at all, is that the smaller sizes o electrical lighting outfits cannot be said as yet t have reached the perfection of the high tension mag neto. There are, of course, several admirable outfit on the market, but the majority of these are rathe expensive, and unnecessarily heavy for motor cycles Less attention has at present been given to the smalle types, though there is no doubt that we already hav some upon the market capable of giving excelle service for the purpose for which they were intende

Further consideration would, however, be neede before attempting to apply them all to the dual pur pose of lighting and ignition. Consequently, whil making suggestions on future possibilities, we wish t make ourselves quite clear to the effect that we do n anticipate any early depreciation in the value o machines equipped with the altogether admirabl system of high tension magneto ignition.

OCCASIONAL COMMENTS

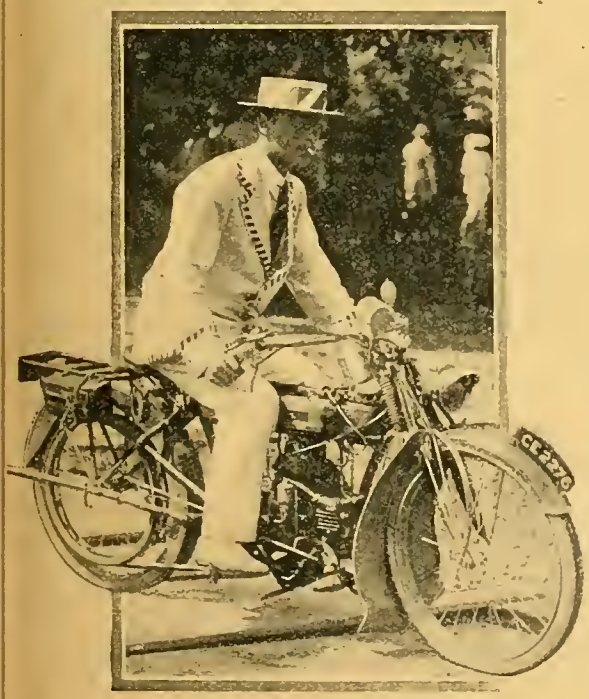
BY IXION

The "Nut" and His Hooter.

The latest nuttiness consists of scrapping the usual alf-guinea hooter, and buying in its place a stumpy ttle cyclorn at about eighteenpence, which is secured the centre of the handle-bar by a few lappings of sulating tape. The unaccustomed impertinent treble queak of the tiny hooter is a fine road clearer at the oment, because people are unfamiliar with it, and onder what is coming. Its efficiency will probably ecrease as soon as a few hundred imitators have pied the practice.

Four Back Axle Brakes.

Many of the modern cycle cars and light cars have l their brakes mounted in the rear hubs—a policy hat must commend itself to any motorist who has ver broken a propeller-shaft or driving chain when is side brake happened to be out of adjustment. ut—beyond all question—the quartette of axle brakes, s fitted to the average modern cycle car, are far too nall in width and diameter. They are usually lined ith the very best friction-resisting materials, but they ear out very rapidly even in the hands of a careful river who uses his brakes as little as possible. I have had several miserable experiences this year due to such brakes quite suddenly wearing down below the gripping limits. In one case such an experience occurred in the middle of a lengthy tour, and the only safe course was to dismount the brakes and pack the remnants of the fabric lining up by putting a strip of zinc beneath it. I hope that the size of the drums will be generally increased for 1915.



As proof of the perfection to which motor cycles have now been brought, one may safely ride to tennis courts or the riverside in white flannels without fear of getting bespattered with oil.

A Word About Fitting Valve Springs.

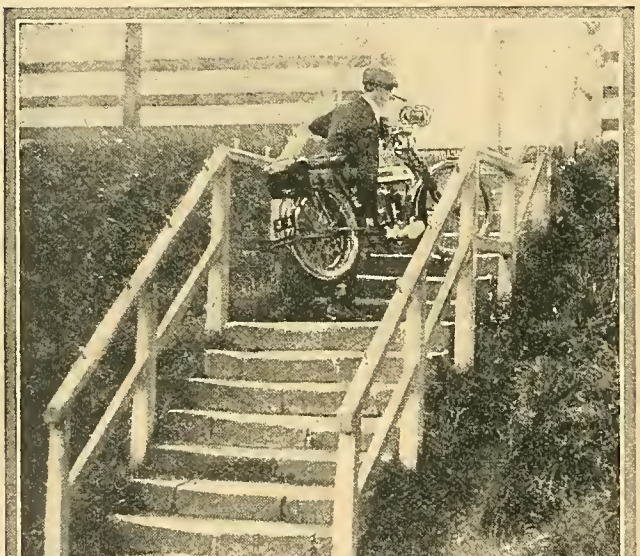
The other day one of the kind friends who visit my garage helped himself to a valve spring removing tool, which has been the faithful companion of my labours for ten years past. Simultaneously, of course, the third cylinder of my cycle car developed a misfire, and when I tested it by opening the compression tap, the merest whiff of a caricature explosion saluted my outraged ears (contrast the other cylinders, which spat flame a foot long into my unwary face!). I hunted in vain for the missing tool, and finally extracted the valves of the errant cylinder with a screwdriver, getting excessively overheated in the job, as the eight valves are as close together as the bristles in an hotel hair brush. When I tried to replace the valve, I laboured in vain for half an hour. Supposing I managed to get the spring compressed, the space available between the valve under attention and the two adjacent inlet valves was so narrow that I could not get the cotter in, and Mrs. Ixion, whose fingers are Burne-Jonesian, was away on the road tuning up her Auto-wheel, which has not been doing better than 110 m.p.g. lately. In this *impasse*, I bethought me of an ancient wrinkle, which, Heaven forgive me, I have often quoted with approval but never tried. "If a valve spring is awkward to replace, compress it in a vice, and tie up the coils with stout twine; it will then slip into place like a *marron glacé!*" I hied me to the vice, tied up both sides of the 30 lb. spring, and released the jaws of the vice. Hey, presto!—both bits of twine fled round to one side of the spring, which assumed a lunar arc. [He means "crescent-shaped appearance."—Ed.] I repeated the process five or six times with no better result, and decided to denounce this nefarious and delusive tip in the public press; incidentally, the spring once flew out of the vice and hit me on the cheek bone at 1,000 m.p.h.; also I tightened the vice on to my golf thumb, which is already terribly abraded as the results of experiments with the overlapping grip. However, the spring was still adrift, and the cycle car was waiting. I now remembered I had a Rudge motor bicycle, the spare springs of which are neatly compressed in little tin cases. Excellent idea. I fetched out a Rudge spring, and noted with glee that the tin sheath was of approximately the right diameter. I sprung the sheath open, and the Rudge spring soared

Occasional Comments.—

over the garden wall; never mind; I don't know how the Rudge Co. coax their springs into the tin sheaths—it cost me many abrasions—but at last I got my spring into the sheath, and then the spring popped merrily into place on the cycle car engine, and I went out and bought three valve spring removers, which I propose to chain to my garage wall.

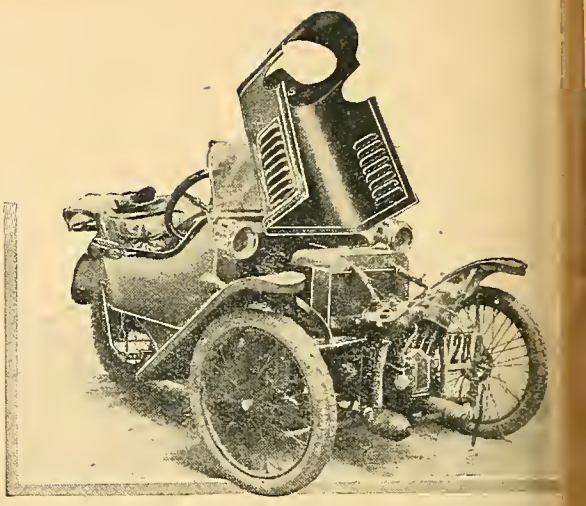
A Good Cleanser.

As my readers know, I seldom give proprietary articles a cheap advertisement in my columns unless there is something unique about them, but I have at last struck a first rate cleanser. It is called Kudos, and is sold by Boots, the well-known chemists. Let me particularise. Almost any cleanser will remove the general film of filth that covers our paws after we have adjusted a driving chain or scraped the carbon off a cylinder. The real crux comes when we try to whiten the soft skin round the arc of the finger nails, in order that we may face our office mates without shame next morning. Many of us find that we cannot get our hands wholly clean under thirty-six hours and three good scrubbings. Kudos can be relied upon to make the filthiest pair of hands fit for a ballroom in five minutes. You put a teaspoonful of it into the dry palm of one hand, and give the hands a dry wash with it, like a shopwalker, until the stic feeling practically disappears. Then do a minut work on the finger tips with a stiff nailbrush, a rinse the stuff off in hot or cold water. You w be quite clean enough to grasp Angelina's fairy fing and murmur—[Irrelevant matter deleted.—Ed.]. I me add that I have not had a free sample, but bei half-way through my third purchased tin of the y I felt I ought to put readers on to a good thing. suggest to Boots, Ltd., that motor cyclists wo appreciate the marketing of a threepenny pocket t to be carried on tour and in reliability trials. T stuff is as cheap and economical as it is efficient.



WHERE THE LIGHTWEIGHT SCORES.

The above photograph amply demonstrates the ease with which a lightweight may be carried up or down steps and through twisty passages—a distinct advantage to those whose residences may be awkwardly situated from a motor cyclist's point of view.



The engine and radiator on the Morgan used by H. F. S Morgan is neatly covered over, giving the vehicle the appearance o an air-cooled model. Our picture shows the bonnet raised.

The Scottish Trials Marking System.

Mr. Campbell McGregor is very kind in explaini the motives of his organising committee, and I consi the Edinburgh M.C.C. have never received full cre for introducing the system of reserving gold med for riders who lose no time marks at all; when th adopted this policy, other clubs were awarding gol to riders who lost one hundred marks.

I am still without sympathy for the "Irishma bonus." Why not award a bonus of fifty marks riders who lose no time marks, in lieu of docking t unfortunate who loses one time mark, an extra fi marks? The silver medal winner would then appe as having only lost one minute during the week, a the gold medal winner's fifty bonus would prevent l marks being lower than those of a silver winner w had earned more climbing marks; surely, this is t more rational escape from Mr. McGregor's dilemm

Mr. McGregor's remarks about the ten-minu margin are beside the point. That margin is p and parcel of the time schedule, and serves to preve the men having to average more than twenty mil per hour after allowing for checking and replenishme stoppages. It does not affect my criticism that no rid should lose fifty-one marks because he is a minu late. I hope a Scotch bonus of "plus fifty" w be substituted for the Irish bonus of "minus fifty in 1915.

The Motor Cycle and the Country Tradesman.

By H. MORTIMER BATTEN.

'N the early days of its existence the motor cycle won for itself a reputation that took long to outlive, and can one wonder when one recalls those norting and unlovely creatures of the road ten years go? The Britisher, whatever he may imagine himself, ; at heart a Conservative, and having once acquired ne idea that motor cycles were unreliable, uncomfortble, and dangerous, he proceeded forthwith to stick o that idea in the face of all proof to the contrary. Then suddenly he awoke with a start, and fell out of ed, so to speak. "Here we have a highly efficient nachine that must in time play an important part in ne commerce of the country," he cried aloud, and aving congratulated himself on his extreme alertness e succumbed once more to the sleep of stupendous Conservatism. Newspaper men tried to rouse him, ut without effect, for ages ago the newspaper man on for himself a worse reputation than the motor ycle has ever deserved. I remember one young ournalist writing an article on the future of the motor ycle—or rather the utter absence of future that was n store for it. "The delicate mechanical parts," said e, "can never be made to stand the great vibration," nd so on. The article pleased the old Conservative ogies of the town so immensely that the young journalist promptly wrote another article describing the immense possibilities of his machine, and now, in time, it would become part of the stock in trade of almost every tradesman. I know this is true because I was the journalist.

The newspaper man goes to work in much the same spirit as the Irish gunner, who, in order to create a sensation, pressed the wrong button at the right time, and sent himself and half his regiment hurtling giddily skywards.

The Value of Time.

So much by the way. The fact of the matter is that a large section of the community still regard the motor cycle as an article of pleasure, a luxury to possess, and are somewhat dubious as to its possibilities from a business point of view. Non-motor cyclists maintain an exaggerated idea as to running expenses, etc., and due to ignorance of this sort they hesitate in making an investment which would probably prove a most valuable one. The two-stroke lightweight, however, is making a strong appeal to many tradesmen —country tradesmen especially—to whom the big 3½ h.p. single was more or less out of reach. I wonder how many country grocers, for instance, there are to-day who use these little machines for running round and booking orders.

For this kind of work the real lightweight is ideal. Ask any country tradesman who possesses one. Not only is it invaluable as a time saver, but it enables its owner to cover a far larger district than he would be able to cover on horseback. And the country tradesman can rest assured that, in these days of fast traffic, he will most assuredly be left behind if he continues to move slowly.

(1) The little two-stroke is ideal for running round and booking orders. The Levis depicted above is on the go all day and all weathers and has yet to fail.

(2) The village storekeeper and postmaster are generally synonymous, and in this case a light "go-anywhere" machine is an immense saver of time and labour.

(3) Quick and easy transportation is the cry of the day, and, above, a village joiner is seen with his old Singer, which is still capable of hard work.

The Motor Cycle and the Country Tradesman.—

Have we not proof of this all over the country? The enterprising city tradesman has in many parts ruined the business of the small country tradesman by using fast-moving traffic, and cutting into a circle where hitherto he was regarded as a trespasser.

The same thing is going on in even the most outlying country districts. The grocer or butcher at A. purchases a motor cycle, and not only is he better able to attend his customers in his immediate neighbourhood, but slowly and surely he is enlarging his circle and encroaching upon the area hitherto supplied by the grocer or butcher at B, who still employs the old-fashioned methods of getting about.

The Advantage of Swift Transit.

The motor cycle is not only a time-saver, but it is a distance-killer, and country tradesmen who are still contemplating the plunge would do well to remember that at this period time is precious. The improvements in variable gears and two-stroke engines have rendered the lightweight a wonderful hill-climber, and there is no doubt whatever that in a year or two most country tradesmen will use this machine in their business.

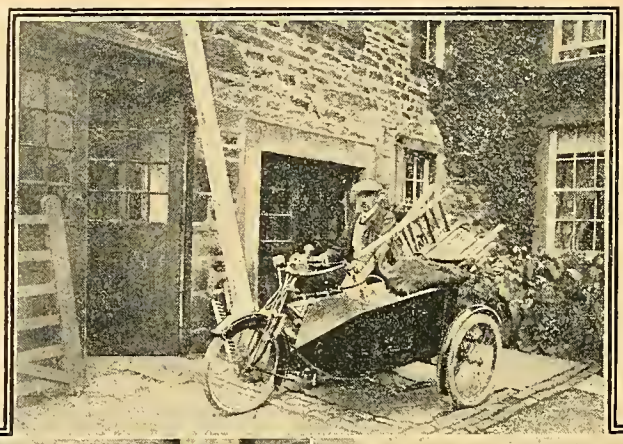
The baby motor cycle is, however, of no use except for solo work—for such tasks as running round and booking orders, superintending workmen on distant jobs, and so on. A far more valuable and useful machine, where the initial expense is not of such great consequence, is the 3½ h.p. single with sidecar attachment. Of course, one's requirements in this line depend entirely upon the nature of one's work, and I am compelled to generalise, drawing upon such practical information as I have procured for this article. Take for instance the country grocer with such a machine in his possession. If he knows a set-screw from a non-skid tyre he can detach his sidecar in a few minutes, and use his machine as a solo runabout. In a hilly district the extra power is an infinite advantage. Then some morning Mrs. Brown wants a sack of flour in a hurry, and Mrs. Smith, who lives in the same direction, is waiting for the delivery of several small bulk goods purchased yesterday. The sack of flour and the other goods are bundled into the sidecar straight away and delivered. Had it been impossible to deliver that flour at once Mrs. Brown would probably have purchased it from the market town next Saturday.

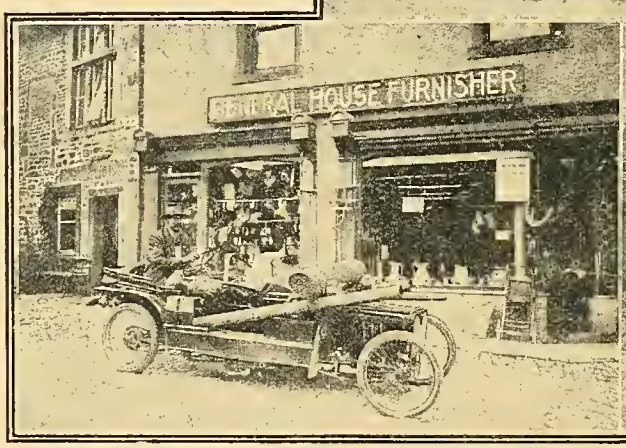
Again it is often a great saving to the house decorator or joiner to be able to take a man and his working requisites to some job a few miles from home, get the man started on his work, then return without loss of time. In scores of ways of this sort is the sidecar combination useful, for one seldom wants to travel solo and without freight of any sort, except when booking orders. Besides, to the family man the sidecar machine is a pleasure to possess.

The Question of Expense.

As regards the comparative expense of the lightweight and the sidecar machine, figures have already been quoted in this journal which should be of value. One finds that the difference in running expenses is not so great as one might imagine, while the comparative convenience of the two articles thoroughly warrants the extra expense of the sidecar outfit. But, as I have already said, it all depends upon one's business.

THE MOTOR CYCLE FOR BUSINESS PURPOSES.





(1) The house decorator, whose 4 h.p. Bradbury sidecar is often made to carry very heavy loads.

(2) This is not a hawking conveyance, but the property of a country tradesman, purchased before the days of sidecar popularity. It is still quite up to the hard tasks it has to perform.

(3) A machine which accomplished more in a few minutes than an errand boy would have done in the same number of hours. A general store keeper and cycle agent with his 1912 3½ h.p. P. and M.

The Motor Cycle and the Country Tradesman.—

A. was a small country grocer of immense ambition th whom I was acquainted. His district was in the art of the Pennines, where 1 in 5 gradients are quite mmon, even on the main roads. At one time he nt from farm to farm booking orders on a push cle, which meant that he walked half the way, and ent at least two days a week away from home. nally, he was induced by his friends to purchase old chain-driven two-speed motor cycle, which rned out a good one, and from that day we note a stinct change in A.'s career. He was the pioneer otor cycle tradesman in this district; he was the one n with push and ambition in the midst of an old-ne community.

Not only was A. enabled, by the new mode of velling, to go his round without exertion, but he on learnt that he could accomplish more on one y than he had previously accomplished in two. He d more time on his hands; he was able to branch t in fresh lines of business. Instead of just maintaining the sure and unfluctuating flow of business his father had maintained, he widened his circle and gained the patronage of many who hitherto were regarded as outside his district. In less than two years A. was purchasing milk wholesale all up and down the county, and transporting by motor 'bus to a neighbouring city.

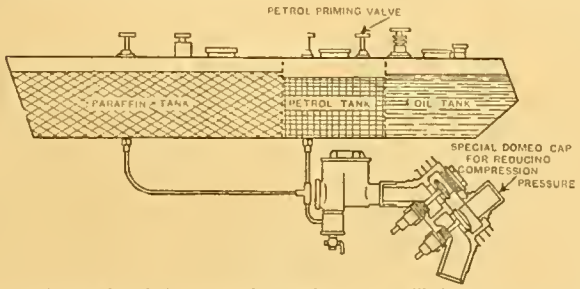
The performances of the latest model lightweights I have seen are really remarkable. They are capable of climbing stiff gradients, and even when they jib at taking up their rider there is nothing to do but dismount and walk alongside. But some cheap form of two-speed gear will shortly make its appearance for attaching to existing mounts of old pattern, so that users can enjoy the refinement which has gained for the motor cycle its popularity of to-day. A year or two hence we shall see the chain-driven two-speed lightweight (enclosed chains, by the way) placed on the market by the thousand, and at a price which will enable every tradesman who is at all dependent on the roads for a living to speculate with security.

A Simple Arrangement for the Use of Paraffin.

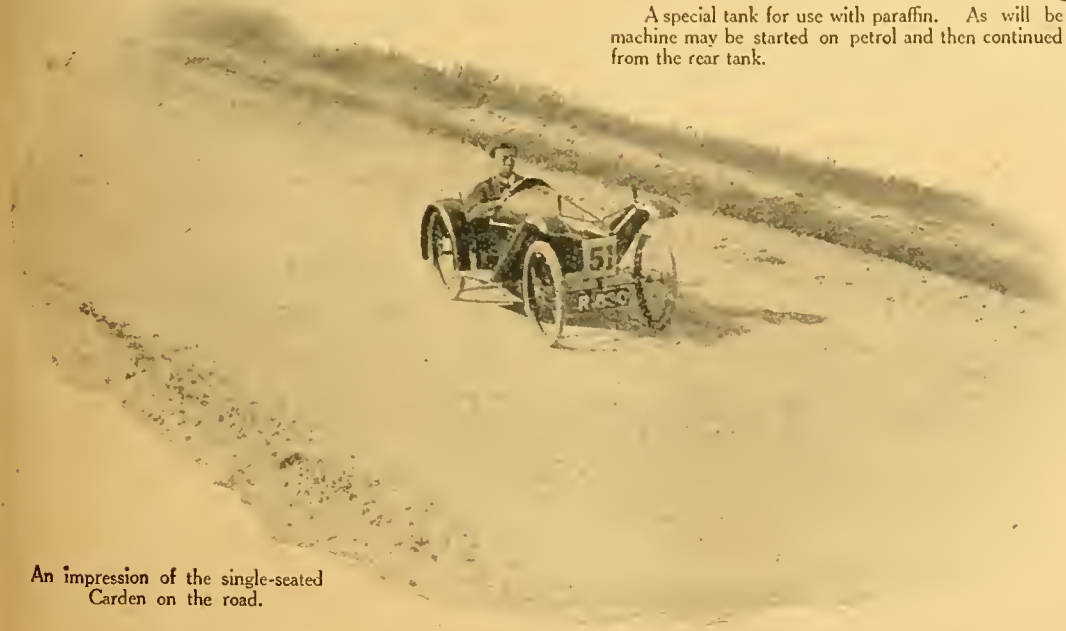
MESSRS. Phelon and Moore have just introduced a simple system for allowing their engine to be run on paraffin. The arrangement is ought about by making an extra division in the nk so that the main part is used for paraffin and smaller portion for petrol, which is used for starting rposes. As soon as the engine is properly warmed the paraffin tap is opened and the petrol tap osed, while a specially domed cap for reducing the mpression when running on paraffin is fitted over e exhaust valve. The accompanying illustration ows clearly how the idea is carried out.

The demand for such an arrangement has emanated om the Colonies, a recent order having been ceived by the firm for four complete sidecar outfits r the Crown Agents for the Colonies, to be sent Nigeria, where petrol costs 3s. per gallon. In consequence of its success, Messrs. Phelon and Moore are considering the desirability of fitting it to all machines sent to tropical countries.

In view of the great difference in price of the two fuels, the device is of general interest to all motor cyclists both at home and abroad.



A special tank for use with paraffin. As will be seen, the machine may be started on petrol and then continued on paraffin from the rear tank.

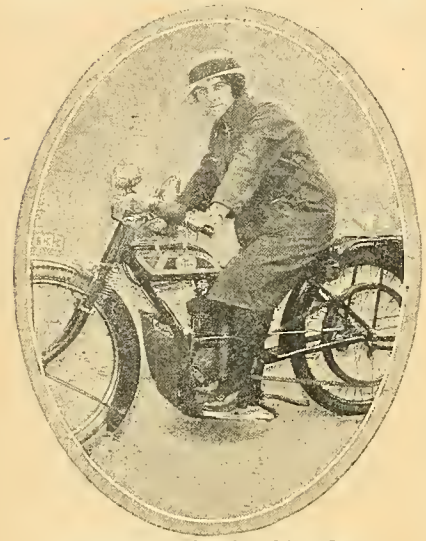


An impression of the single-seated Carden on the road.

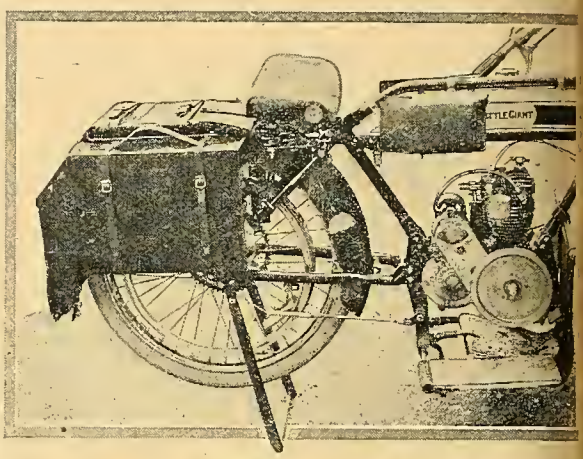
A 2 h.p. Four-stroke.

SOME NOVEL LUGGAGE-CARRYING DEVICES.

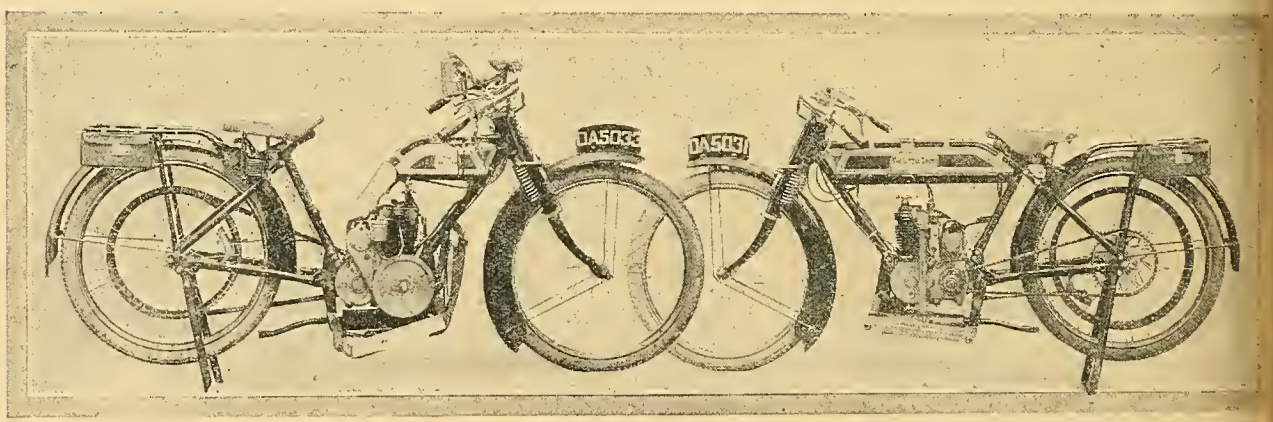
THE pleasure of ultra-lightweight riding was once more brought home to us very forcibly whilst testing the products of the Little Giant Motorcyclette Co., 101, High Street, Uxbridge, Middlesex. All three models were taken out on the road, and Miss Henry, who gives special demonstrations on the ladies' machine, showed how delightfully simple it was for members of the fair sex to handle such a motor cycle without appearing to be inelegant or masculine. The power developed by the Precision unit is extraordinary, and a speed of thirty-five miles per hour could be obtained quite easily on the chain-driven model, which was geared somewhat higher than the other two. With the special hammock footboards the riding position is greatly enhanced and very little engine vibration is to be felt. The gear change is simplicity itself, for the leverage on the large transverse pedal renders it possible to engage the gears with the lightest touch. On the ordinary machine single Druid spring forks are utilised, but a girder fork will be embodied on the special Colonial model which is now being constructed. Special attention should be given to the ladies' machine, on which the dropping of the frame and protection from the engine have been carried out very neatly. Our experience of their behaviour on the road, both in the matter of easy starting and speed (fast and slow), was particularly gratifying.



Miss Henry on the 2 h.p. Little Giant, specially designed for ladies' use.



A luggage-carrying Little Giant, which is fitted with very neat detachable pannier boxes. Note how the knee grips are also utilised as tool bags. The saddle may be used for carrying maps, etc



The ladies' model, which has a cut-away frame and belt drive.

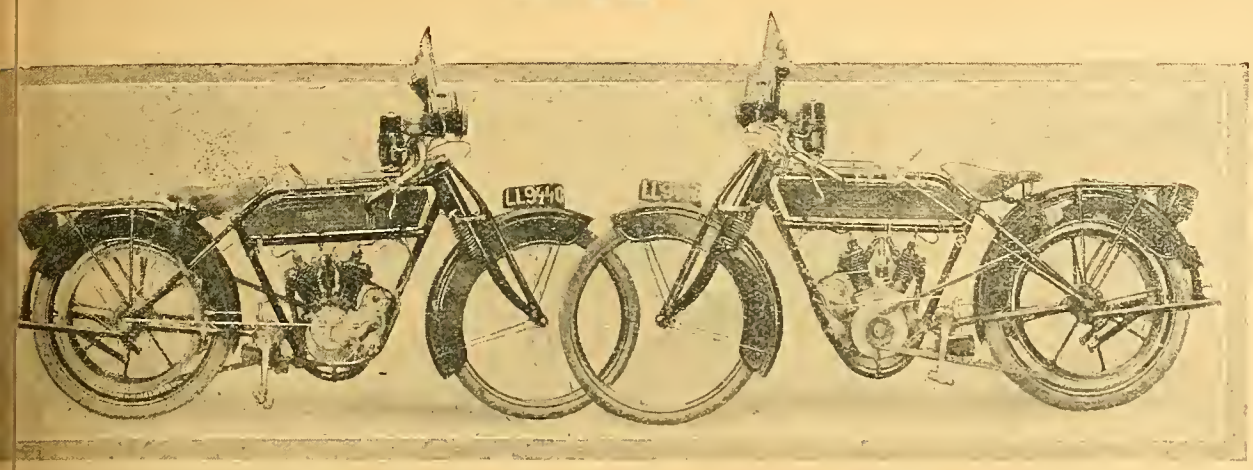
The 2¾ h.p. Peugeot Twin.

A WELL-DESIGNED FRENCH LIGHTWEIGHT.

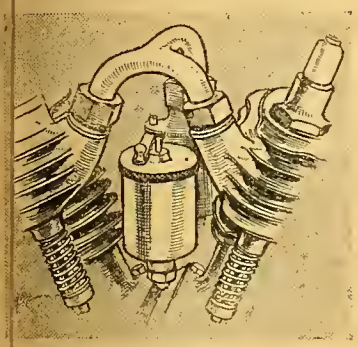
IT is only to be expected that any product of such a renowned and old-established firm as Peugeot should border on the exceptional; therefore, it was with this idea in our heads that we inspected and tried a lightweight model fitted with a 2¾ h.p. power unit. We were, of course, quite correct in our conjectures, for the power developed by the engine, which is a standard touring type, was really quite remarkable. Why this should be so is due to several vital attributes which give efficiency to an engine, such as large valves, short inlet pipe, and excellent workmanship. The two cylinders are placed at an angle of 45° and have side by side valves, which are so positioned that the T-shaped inlet pipe can be placed in between the cylinders. There the Claudel carburetter is also attached, and a consequent warming up of the whole gas-making device is the result. For ignition a Bosch magneto is relied upon, and is mounted on a platform at the forward end of the engine. When riding we could not help noticing the freedom from vibration, even when the engine was turning over at high speed, which certainly shows that balancing has been carried out with great skill. Another great asset to the machine was the three-speed Armstrong gear which enabled a really high velocity on the level without stressing the engine unduly, for with three ratios the top speed can always be comparatively high.

The kick starter, which is of the ordinary pedalling gear type, can be easily dispensed with, and it is quite



Both sides of the 2¾ h.p. twin-cylinder Peugeot, fitted with belt drive, Armstrong three-speed gear, and side-by-side valve engine.

s to negotiate crowded thoroughfares i out resorting to the clutch. On the arity of motor cycles the handle-bar o ated brake on to the front wheel is ess, and it is there because the law e nds its presence. In this case, o ver, the brake shoe works in the

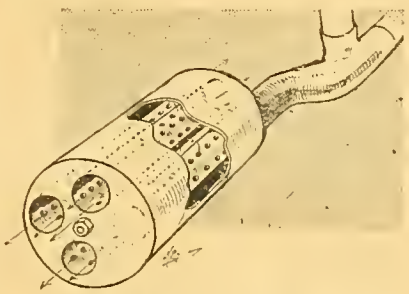


rangement of inlet pipe and carburetter on the 2¾ h.p. Peugeot.

special pulley provided for the orthodox foot-actioned brake, and is most effective as well as being very sweet in action. The design of the silencer is most meritorious both in theory and practice, although it is quite simple, as a careful study of the illustration will reveal. In order to make the rear wheel as accessible as possible, three large wing nuts only are utilised to hold on the mudguard and carrier. Being fitted with powerful spring washers, there is very little chance of them coming adrift through vibration, and the elimination of these appendages gives one a great deal of room in carrying out tyre repairs and other adjustments.

An Advantage of Low Compression.

For starting, it was only necessary, even when cold, to paddle the machine for a few yards, and firing would commence immediately. The low compression assisted greatly in this, and rendered the use of the clutch quite unnecessary when driving in traffic. During our run on the road, many bumpy stretches were encountered, but the suspension was quite up to the average, and there is no doubt that for solo touring this little mount is bound to appeal to all who sample its running. R. Dequin, 32, Queen Victoria Street, E.C., is handling the machine in this country.



The unique silencer which is a standard fitting of the 2¾ h.p. Peugeot. When the machine is in motion there is a continuous draught of air passing through, and drawing out the gases.

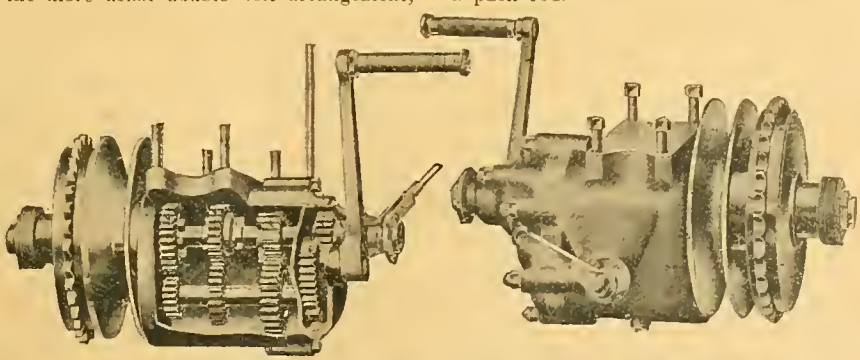
The New Hudson Counter-shaft Gear.

Three Speeds Provided, a Clutch with Cork Inserts, and Enclosed Kick-starter.

ONSIDERABLE interest was caused when the New Hudson team entered for the Scottish Six Days Trials with three-speed counter- gears, and there was some specula- as to what was "inside." The gear is very neatly made, and is substanti- bolted up to the bottom bracket. gears are of ample width and gth, and are mounted on shafts h run in ball bearings. Only one ng member is used, and this com- s a gear wheel and two dog clutches, h are moved laterally on a squared by means of a striking fork to lock gears required to the shaft.

he clutch is of the cork insert , having five plates and an easily sted spring tension, the device g on a series of small coil springs, h are considered more satisfactory one large one. Both chain sprocket belt pulley lie on the same side, the er being mounted on the ontside, and the kick-starter gear is entirely enclosed in the gear box.

The gear box is bolted up to the bottom bracket by four bolts instead of the more usual double bolt arrangement, and the clutch is controlled by an internally screwed cap working on a quick thread screwed boss, the movement being transmitted to the plates by a push rod.



Interior and exterior of the New Hudson three-speed counter-shaft gear with clutch and kick starter.

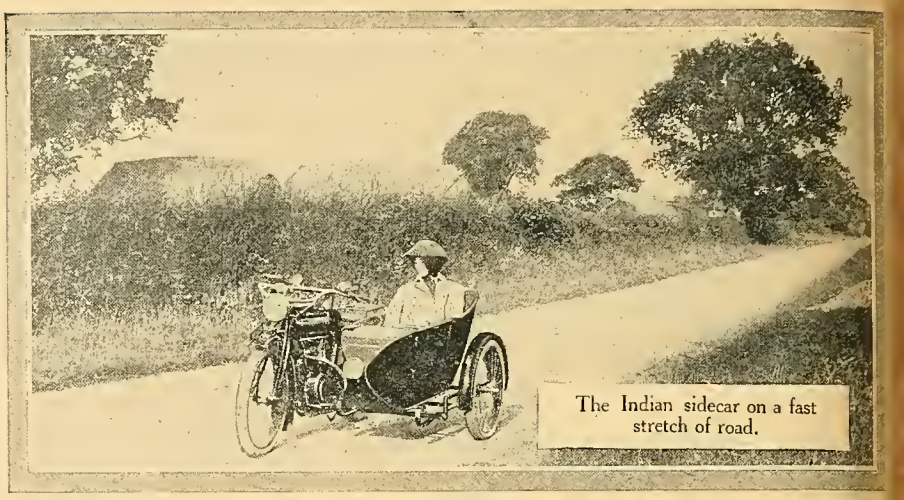
MACHINES ON THE ROAD.

The 7 h.p. Indian Sidecar Combination.



The Indian sidecar on a fast stretch of road.

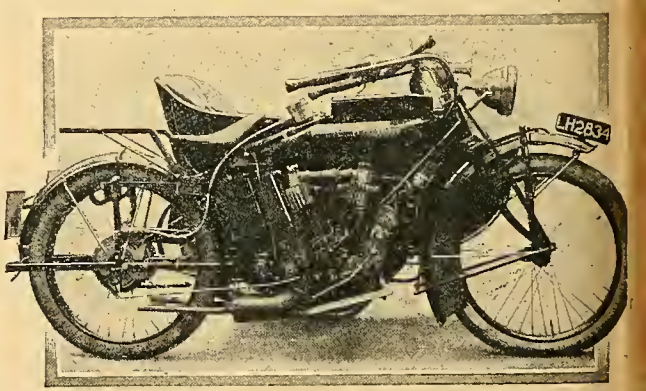
ELEVEN years ago we made our first trial trip on a sidecar built up by the inventor of this popular attachment, Mr. Graham, of Enfield. We were so pleased with this method of carrying a passenger that very soon after we ordered a sidecar from the Ariel Co., who started to manufacture under licence from Mr. Graham. It was attached to a 2¾ h.p. Ormonde (76 mm. × 80 mm.), which was, of course, single geared, and in consequence a torture to drive through town, while it required much physical efforts to coax it up a worse hill than 1 in 20, and 1 in 12 was its limit. Still it gave us much pleasure, though the sidecar was naturally not so comfortable as those turned out at present. It is also interesting to record that it was one of the first sidecar combinations in England. All this appears to be somewhat of a digression, but we crave forgiveness, as it serves the useful purpose of comparing an old machine with the modern and luxurious vehicle we recently had the opportunity of testing. This latter was the property of a colleague, who had run it just long enough to allow it to "find itself," and it had been a great success. It was one of the very latest pattern 7 h.p. "Hendee Specials," fitted with electric starter and lighting, and equipped regardless of expense.

Springing and Hill-climbing.

The springing is wonderfully good, and the extreme comfort of the combination on rough roads must be experienced to be appreciated. Long before we realised it we were bowling along the road at a speed far in excess of the legal limit, when a sudden desire to attempt a hill led us to leave the turnpike and turn up a by-road. The gradient was nothing serious, and was unnoticed by the Indian, so we retraced our tracks and made for a more severe climb. This had a maximum gradient of about 1 in 12, and is, on account of its winding nature, quite steep enough to cause most cars to drop to second speed. But the Indian treated it as nought, and romped up at an easy thirty by the Corbin speedometer. The most noticeable feature of the climb was the wonderful power of the combination to accelerate after negotiating a corner, which is possessed by few other self-propelled vehicles. We found the twist handle control to be delightful, and very easy to manipulate. Our next test was to try restarting on a gradient, which, thanks to the excellent clutch, was most easily accomplished. The engine i well balanced, the change speed gear is simple in th extreme, and the handling of the machine delightfu in every way. The passenger was loud in her praise of the special Mills-Fulford sidecar which is built fo the Indian.

A Small Criticism.

An article such as this is worthless without criticism but in the Indian there is little to criticise, and ther are only a few details at which one can cavil. I the first place, the filler caps are too small, and thos fitted to the T.T. models should be standard next year the change speed lever is on the small side, though thi point is of not such great importance; while, lastly, th dial of the speedometer might be in a position in whic it can be more easily read. Points which most strongl appeal to the experienced rider are the excelle luggage carrier, the hefty stand, the comfortable foo boards, the substantial metal tool cases, and the in genious petrol injector. People are apt to regard th dynamo lighting set and starter as an unnecessary com plication, which is likely to give trouble, but we ca assure them that trouble in this direction is not likel to occur, and if it does the combination can be easil started on the low gear and either accumulators o dynamo will supply enough current to light the lamps We were particularly pleased to note the excellent wa in which the electric equipment is made.



Valve side of the 7 h.p. two-speed Indian sidecar on which the tests were made.

A tyre discovery

IN the Dunlop rubber-studded motor-cycle tyre the Dunlop way of always trying to do better than before has produced an extraordinarily fine thing.

Its bold design at once takes the eye of the expert. Look at the big strong studs. Look at the thickness of the rubber in the tread. Everyone knows how Dunlop tyres have stood up to their work in the big races and trials, and that they have been used by scores of successful riders. These achievements justify the reasons on which the design is founded.

But what may well be called a tyre discovery is the mixing which governs the exact composition of the covers of Dunlop motor-cycle tyres, and which is giving wonderful results with regard to wear-resisting qualities.

In normal circumstances the rate at which rubber is lost by Dunlop tyres by wear is extraordinarily low. As tyre economy is a matter of mileage price, not initial price, see that you have

Motor Cycling Skirts.

Sir,—If some of your lady readers could give me some patterns of riding skirts for motor cycling I should feel much obliged. MYRTLE DANIEL.

[Replies should be addressed c/o the Editor.]

The Rule of the Road.

Sir,—May I be permitted, through the medium of your columns, to endorse the statements of Thomas B. Crow in his letter published in your issue of the 16th inst.? There are scores of most dangerous corners all round this part of the country (Ilminster), and it seems to be the vogue to take these habitually on the wrong side. In this case I fear that it is car owners who are the chief culprits, but many motor cyclists are just as bad. Personally, I take them myself on my lowest gear, ready to declutch at any moment. All this I consider the only safe way, as straying live stock abound in these parts. May I therefore ask any motor cyclist who may be passing this way to be on the look out for extremely dangerous corners, and to take them with the utmost caution. A. J. M. WILSON.

The Price of Petrol.

Sir,—The action of the leading motor spirit purveyors in reducing the price of petrol is a striking and significant contribute to the value of competition against colossal monopolies.

Thanks to the efforts of the Motor Owners' Petrol Combine the whole motoring public will now reap the benefit of a reduction in the price of petrol by one penny per gallon. This, I think, shows very clearly that the great monopolists can be successfully fought by intelligent co-operation.

It is entirely owing to a steadfast adherence to the policy determined upon when the Motor Owners' Petrol Combine was inaugurated that the motoring public derives the advantage I have indicated. CHAS. JARROTT.

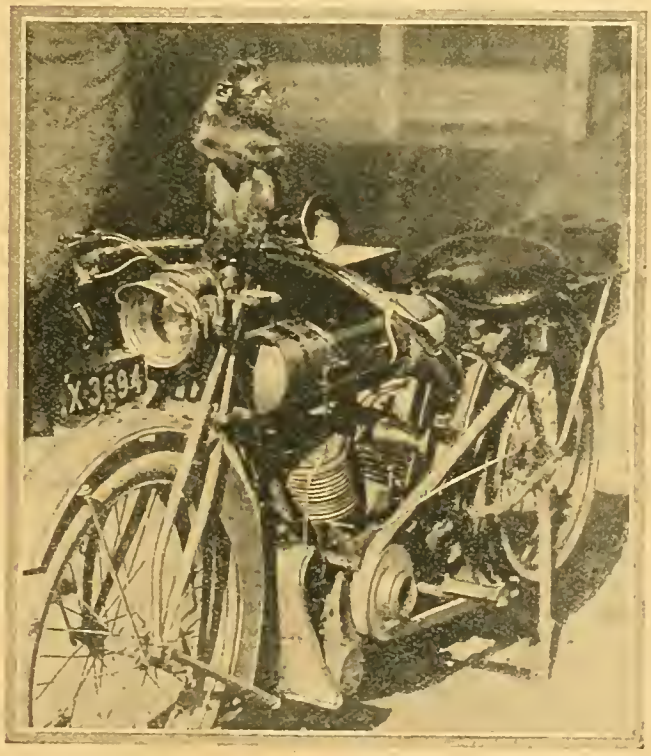
Look to the Fuel.

Sir,—Seeing that a motorist was recently supplied with water out of a petrol tin, I thought the following might interest you.

Lately, while touring in the North on a new 3½ h.p., after stopping about half an hour for lunch, all efforts to start were futile, although ten willing helpers overhauled every point of the machine. After being "stuck" for three hours it was discovered there was paraffin in the tank, which I had apparently been supplied with instead of petrol, and this out of a well-known vendor's petrol tin! The fact of doing fifteen miles after receiving such replenishment naturally disarmed any suspicion of the trouble arising from the "juice" quarter. I wonder how many riders would have spotted it earlier? AB 3778.

Lightweights v. Heavyweights.

Sir,—As so many of your correspondents have just lately been enlarging on the merits, etc., of the ultra-lightweight motor cycle, I think it is time some of us old hands defended the old and ever trusty 3½ h.p. It would appear that the lightweight and the small two-stroke are the only machines which should be ridden, and any newcomer to the ranks of motor cyclists seems to view the "heavy 3½" as a great and unwieldy piece of machinery which can only be ridden by an expert, and is firmly convinced that a very small machine will "do for him." Sooner or later, however, he wants to go on tour and take plenty of luggage with him, but is afraid of starting with any weight on account of the big hills and his small power. The rider of the 3½ h.p. never has any of these fears—he knows that he can climb any reasonable hill, and if he has a variable gear he can be sure of getting anywhere. For myself, I have ridden lightweight singles and twins, heavyweight twins, and big singles, and I have for some time now been riding a 3½ h.p., which most people call heavy, but I do not find the slightest difficulty in managing it, and I recently did a journey of 245 miles over the rough cobbles of Lancashire without the slightest sign of trouble. LE 1809.



A NOVEL MASCOT.

A live monkey perched on the front of the 6 h.p. Matchless owned by W. Willis, of Newcastle. The monkey thoroughly enjoys a good spin in this position, and when the owner leaves the machine it is with the confidence that it will be quite safe in the monkey's care.

The Question of Gear Ratios.

Sir,—I was very pleased to read a letter from Mr. Stranger *re* the above in your issue of July 9th.

I am quite of the same opinion that a comparison of the relative power of engines is quite impossible under the conditions which prevail at the present time.

For example—take the case of a certain make which has been very successful in various trials during the past year. The manufacturers make a particular point among others of "engine efficiency" and "correct gear ratios." This engine is rated as 6 h.p., and the gears fitted are, if my memory serves me right, 5, 7½, and 16 to 1.

Now 16 to 1 is the lowest gear fitted to any standard 6 h.p. machine, and I fail to comprehend how the makers reconcile engine efficiency with such a low ratio. I notice in the six days A.C.U. trials, Class H (750 c.c.), there were several machines of considerable less cubic capacity fitted with much higher gears.

It goes without saying that the higher power lower-geared combinations should do a great deal better than the rest, especially on freak hills, and such performances are certain to convey the wrong impressions to the newcomer. If one compares the entries in the class referred to, which range from 598 c.c., gears 5½ to 14 to 1, to 750 c.c., gears 5 to 16½ to 1, it will be seen at once how difficult it is to form a fair judgment as to the real merits of the different engines.

HEATHEN.

Fracturing Hub Cups.

Sir,—I write to enquire whether any of your readers can give me any hint as to the real cause of a most annoying experience which has come to me lately.

After riding my new 2¾ h.p. twin for about 750 miles the left hub cup of the rear hub fractured right round just at the edge of the hub. I had a new one fitted by a very capable mechanic who has been employed in cycle works a great part of his life. I rode the machine just over 100 miles when the same thing happened again. I again procured from the makers a new cup, and at the same time had the spindle tested in the lathe. The latter was shown to be quite true. I also had the new balls very carefully inspected in case there might be a shoulder on any of them. The cup was again very carefully fitted by a first-rate mechanic, and, moreover, I took the precaution of submitting the job to another, also of reputable standing as a cycle hand. He pronounced it to be quite well fitted. Thereupon I rode the machine just six miles when precisely the same fracture took place. The sides of the cups seem to be very thin. Possibly the tempering of the steel might be at fault, but I cannot see that there could be anything wrong with the fitting of the cup.

L.K.G.

Gibraltar.

[We should think that the cups have been over-hardened, or that they are not quite true.—ED.]

Overseas Notes.

Sir,—In the recent copies of *The Motor Cycle* I have noticed some very interesting overseas notes, and maybe a little news on the good old sport out here will interest you.

Having ridden most makes of motor cycles during the past nine years in England, and having been kept well to the fore through your most excellent paper, which is absolute life to me, when I decided to come to Bombay I had no hesitation as to what type of machine was to accompany me. I fully intended to get a new machine, but when visiting the works in Birmingham, I had the great luck to hit upon Mr. S. F. Garrett's last year's Tourist Trophy Regal-Green, which was in the shops being overhauled for this season's racing. This so much took my eye that I decided to have it. I had what I now consider for this country, at any rate, one vast improvement made, viz., a Brampton gear fitted in lieu of the existing three-speed hub. I have owned several machines fitted with the best known makes of hub gears, which at times have given perfect satisfaction, but have not, previous to this, had the sense to try the simple yet perfect Brampton pulley. It is, to me, the very last word in gears, all types included.

Being a member of the P.S.M.C.C. I was asked to form a branch here before I left the old land, but after my arrival I soon saw that to do this was well-nigh impossible.

The difficulty is not due to the lack of motor cyclists, as there are quite a good number here, but to the great lack of any keenness. The average limit seems to be a ri down to the office or on Sundays perhaps a ride round t houses on a highly-polished machine which spends most the week under the charge of some wretched black bo having imaginary dust and mosquitoes wiped off it.

In spite of all this, there is, in most cases, a glorio knock!

Nevertheless, there is any amount of quite good ridi to be had if one cares to strike out.

Undoubtedly the ideal machine for this country is eith a T.T. or a T.T. roadster model, fitted with a simple y efficient variable gear and a water-cooled engine. As regar carburation, I find the Amac very fine working on a j half the size of their smallest.

The worst thing a man coming out can do is to get a ne machine packed up at the works and sent straight off. L the individual buy his mount some months before starti and test it well. Charges in the garages are always excee ingly high. I lately struck a man who paid fifteen rupe (one pound) for having his float level altered!!

Wishing the staff of the finest paper in the world t best of luck,

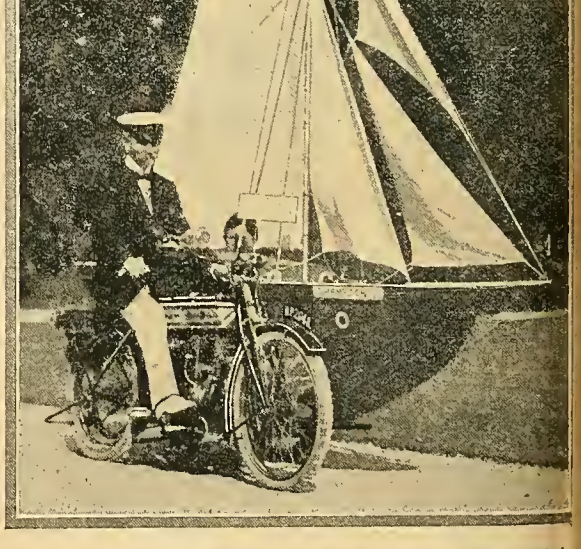
D. CHURCHILL WEIR.

Bombay.

Age Limits for Accident Insurance.

Sir,—Is there any sound accident insurance company whi issues accident policies in respect of motor cars and mot cycles to owners and riders above the ages respectively sixty and fifty-five? I ask this question because I find th the Motor Union Insurance Co. absolutely refuses to iss such policies to drivers of motor cars above the age of sixt and of motor cycles above the age of fifty-five! No difficul is made about issuing such policies to a motor cyclist ag sixteen, who knows absolutely nothing about his or h machine, who has never ridden one before, and who chances of coming to grief are very obvious, while t experienced, careful man or woman is absolutely declin solely because he or she is "over age." A greater absurdi can hardly be imagined. I suppose one's chance of being r into by a road hog, or novice, increases with one's own ag

MEDICUS.



At a recent demonstration in aid of one of the Sussex hospita's quite a novel idea was the sidecar fitted to a Rudge Multi, decorated to form a small replica of Shamrock IV.

Average Speeds.

Sir,—In your issue of the 23rd, "Water-cooled Enthusiast" states that his machine (a 3½ w.c. Green-Precision), "geared 4⅞ to 1, with coachbuilt sidecar and two passengers' . . . will average 40 m.p.h. on decent give-and-take roads." Will this enthusiastic gentleman inform us at what speed he usually drives through a ten-mile limit? Even suppose he cuts down to 20 m.p.h., he is undoubtedly "some" rider. Or does he really know what an average of 40 m.p.h. on the road means? SCEPTICAL.

Unnecessary Horn Blowing.

Sir,—Why do all motorists continue to be so thoughtless when passing churches on Sundays in the summer. Cannot they recollect that the windows are all open and that therefore the blare of their horn is as audible inside as it is in the road? During the next few weeks of holiday time there is every cause for this reminder, especially to tourists at seaside places. On a recent Sunday morning the service I attended at Sheringham was punctuated by the various insistent noises from motor horns—electric and pneumatic—culminating in a startled look round by half the congregation when some boor came slowly by outside, making a continuous and deafening din which completely stopped the service for a time. I have driven my own car for many years, and never sound my horn when passing a church, preferring rather to slow up if necessary. DAIMLER.

Four-speed Morgans.

Sir,—The letter of your anonymous correspondent "North Countryman" is slightly irrelevant. The fact that a driver may (and at first usually does) find some difficulty in operating our four-speed gear has obviously nothing to do with the fact that the gear is supplied to anyone who orders it, and that (as a matter of fact) a number of these gears have been supplied and have given satisfaction. We do not profess to supply a perfect four-speed gear box for £10. Again, we did not state that "three of the machines belonged to private owners.' What we did state was that "the cars running in the Scottish Trial were, with one exception, entered by purchasers and not by the firm." Three of our cars were running (Mr. Rex Mundy's engine seized on the way up and he did not run), and of these only one (Mr. Grout's) was entered by the firm. Mr. James and Mr. Gibson purchased their cars from us. Whether or not these gentlemen are connected with other motor firms is not material. The point is that we are supplying these gears to our agents and to the public in accordance with the specification in our catalogue. The four-speed Morgan is therefore in the strictest sense standardised.

MORGAN MOTOR CO., LTD.

The A.C.U. Six Days Trials.

Sir,—There are dissenters to the conditions of almost every event, but the amount of protest against the eminently suitable A.C.U. course as a test has surprised me. Of what possible use for serious testing can a course be that presents but easily overcome difficulties? The average hill is not a test for an engine of even medium quality, and the average road surface is no test for forks, frames, tyres, etc.

If the trials are purely for the purpose of enabling gold medals to be acquired we could justly grumble at the conditions, etc., and go in for the London-Edinburgh procession. But if we wish to learn and to maintain the progress that has placed motor cycles of British manufacture in their present premier position, then we must continue to test them, and I know of no better way than the A.C.U. trial. The pity is, the test is almost as great—perhaps greater in some cases—for the man as for the machine, although possibly, so far as the sporting spirit goes, some of us need testing, for we don't appear to have taken our gruel in a very sporting manner. The severity of the course is its recommendation. Modification in certain directions may be desirable or necessary, perhaps, in the direction of speed averages, and possibly some of the worst sections of road should not be non-stop.

Regarding the so-called farce of the brake test, this test I consider most useful and necessary, in spite of the outcry against it, the only apparent objection being that the brakes had been sufficiently tested on the severe hills encountered. It is true they were tested, but it cannot be said they were not in many cases found wanting. Stripped or glazed pads, the straightening out of badly-designed brake rods, and other causes had rendered some brakes inoperative, riders descending hills relying almost solely upon their low gear, the compression of a stationary engine, and using the clutch as a brake. The comparative retarding effect or efficiency of the various brakes could not be learned except by the special test.

A fairly high standard was certainly set up for the acceleration test, but not an impossible one, although it was an oversight, I think, to give the same task to the passenger as to the solo machines. As to the hills being too severe, there was no hill in the trial that could not be climbed by a good machine. Littonstack, against which most outcry has been made, was climbed by my "Big Four" passenger combination with standard gears and power in reserve; several other machines also made clean ascents. There was much wheel spinning among the failures, this largely due to uneven engine torque, as well as gradient. I would suggest that competitors should be checked at the foot of narrow hills, and sent up singly, the failures returning and proceeding by an alternative route.

Some details of organisation leave room for improvement, otherwise I heartily congratulate the A.C.U. upon a useful trial, and the medallists upon an acquisition well earned.

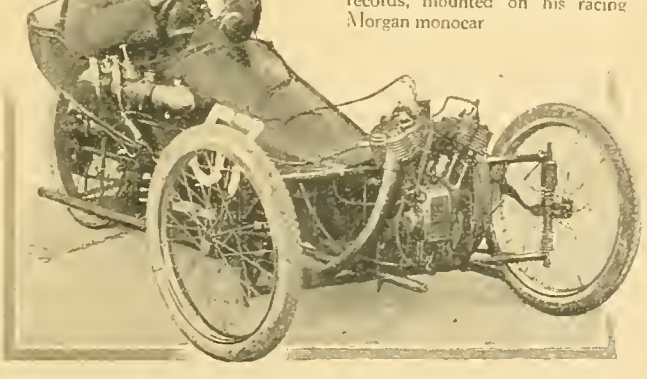
JAMES L. NORTON.

Sir,—We have read with interest the correspondence and criticisms which have appeared in the trade press and the technical press respecting the above trial. While we, as manufacturers, feel that the trial was not organised by any means as happily as it might have been, we hardly think some of the comments, to wit, that it was a trial "to destruction," exactly correct.

A number of machines were successful in gaining gold medals, but possibly a striking testimony to the reliability of the present day machine can be instanced in the L.M.C. machine ridden by Mr. Bees. This same machine competed in the A.C.U. Six Days Trial in 1913, and it has been used in innumerable trials since at home and on the Continent, and it is the same machine, with identical forks, frame, engine, etc., that was used in the Scottish Six Days Trial, English Six Days Trial, and Irish End-to-end Reliability Trial.

Now, dates will show that the English Six Days Trial only permitted of the machine returning to Birmingham after the A.C.U. Six Days Trial on Monday, the 13th, and in order to start from Cork for the Irish Trial it was necessary that the competitor should leave Birmingham on the next day (Tuesday), as the trial started at 4 a.m. on Thursday, the 16th. It is, therefore, clear that nothing could be done to the machine beyond mere cleaning in the small margin of time allowed, yet the same machine succeeded in securing the highest award, namely, a gold medal in all these three events. When an old machine like this that has done many thousands of miles goes through these strenuous trials unscathed one can hardly regard them as "trials to destruction."

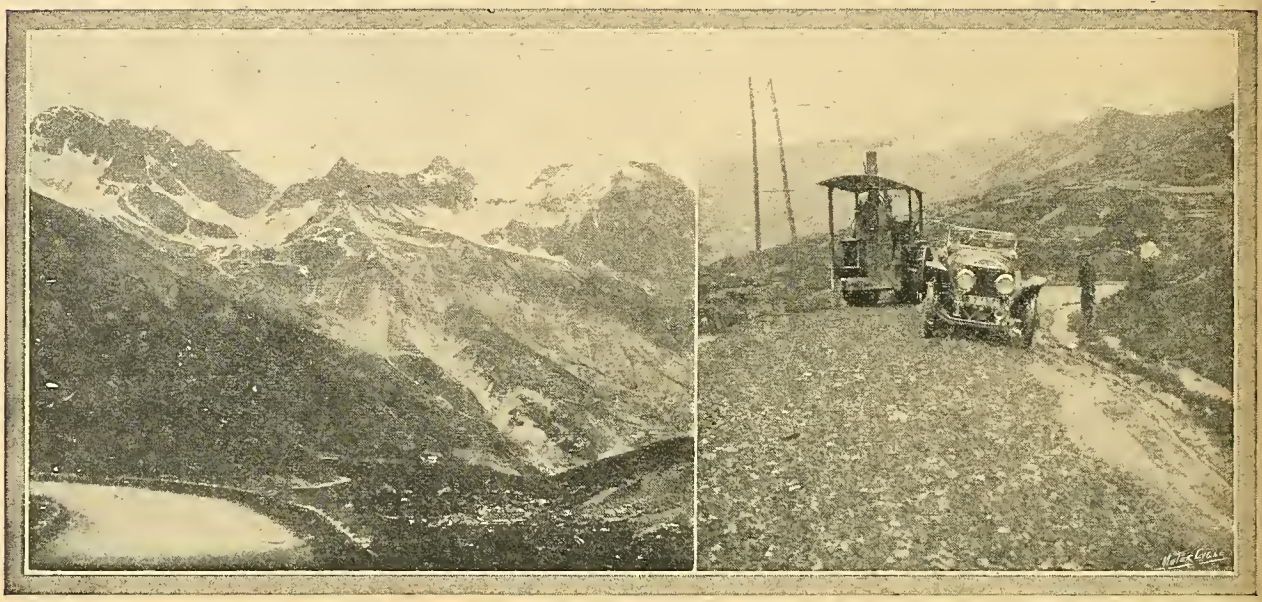
THE LLOYD MOTOR ENGINEERING CO., LTD.,
J. W. SPARK, Managing Director.



E. B. Ware, who won the light car event on Saturday last at Brooklands, besides breaking three records, mounted on his racing Morgan monocar

THE INTERNATIONAL SIX DAYS TRIAL.

A Brief Description of the Mountain Passes in Next Week's Alpine Trial. The Galibier Considered the Most Difficult Test.



SCENES ON THE COURSE FOR THE SIX DAYS INTERNATIONAL TRIAL IN FRANCE.

(1) A striking view from the Lautaret summit. The snow will have practically disappeared when the competitors are there next week. The road may be seen winding away to the left of the photograph.

(2) On the Col du Lautaret. A steam roller at work over 6,000 feet above the sea level.

ON Monday next, the 3rd prox., the International Six Days Trial will start from Grenoble, the examination of the competing machines having been arranged to take place the day previously at the Skating Rink, Rue Condorcet, Grenoble. The trial starts with a journey over the foothills of the Alps. Before lunch there is nothing very serious in the way of gradients, but about sixteen miles from the start there is a long climb beginning with a pitch of from 1 in 12.5-1 in 9 over a flinty road with bad surface. After lunch at Saillans there ensues the long winding ascent of twelve miles of the Col du Rousset, which begins seventeen miles after the luncheon stop. A tunnel, a quarter of a mile long, must be traversed, which is badly lighted, while the surface is damp and likely to cause skidding. No other gradient in the afternoon exceeds 1 in 12.5, but there are several small tunnels. It is interesting to note that the regulations require competitors to have their lamps lighted while traversing these tunnels. The distance for the day is 149 miles.

Second Day's Run.

On the second day more of the minor French passes are traversed. Twenty-one miles from the start the Col du Fau is ascended, a climb of 1 in 14, for two kilometres, with two dangerous *caniveaux* or gullies. Luncheon is served at Gap, immediately after which there ensues a climb varying from 1 in 11 to 1 in 8.3 for three and a half miles, towards the summit of the Col Bayard. In another place, named Le Motty, some eighteen miles farther on, there is a winding ascent of about 1 in 7 for half a mile. There appears to be nothing serious after this. The total distance is 124 miles.

Several Mountain Passes on Third Day.

A number of passes are crossed on the third day, the first being the Col du Frêne, the first of that name, ascended during the day, a climb of 1 in 9 to 1 in 14, extending for five miles over a winding road. Another is the Col des Près, at the Chambéry road fork; the gradient is from 1 in 11 to 1 in 9 for half a mile, followed shortly after at Les Déserts by a gradient of 1 in 8. There is a stop for lunch at Pont-de-Lescheraines. Some twenty-four miles after lunch, after leaving Chambéry there is an ascent varying from 1 in 7 to 1 in 16 for nine miles, followed by a tunnel, in which the surface is in bad condition, and the road very narrow and dangerous if one has to pass any other vehicle. This leads up to the second Col du Frêne, which is followed by the Col du Cucheron, which has a gradient of 1 in 10. The old Benedictine monastery of La Chartreuse is then passed, where the famous Benedictine liqueur used to be made before the dissolution of the monasteries in France. Two more Cols have yet to be climbed, the Col de Porte, 1 in 9 to 1 in 12.5, and the Col de Vence. A total distance of 141 miles.

Thursday, the 6th August, will be counted as a day of rest, during which time the complete machines will be exhibited in the Skating Rink, Rue Condorcet, Grenoble.

The Last Day in the Alps.

The fourth day of the trial takes the competitors over the finest scenery to be found in the whole of South-eastern France, and equal to any in Switzerland. The ascent of the Lautaret is easy, and there is nothing worse than 1 in 11, but after the summit, which is reached after traversing two well-lighted but rather badly surfaced tunnels, the road descends for 1¼ miles, and the severest climb of all is encountered. This is the famous Galibier, the maximum gradient of which is 1 in 7. The tunnel on the summit is badly lighted, the surface is poor and very damp. The descent is narrow, winding, and requires great care. The ascent of the Col de la Croix-de-Fer takes place after lunch, and though the gradient does not exceed 1 in 10 it is exceedingly dangerous, owing to the narrowness of the road and the precipices at the side. According to Mr. C. L. Freeston, this is the worst road in the trial, and it is absolutely unfenced. The day's run finishes with the ascent of the Col du Glandon, which is easier than the aforementioned pass.

The two days' run to Paris on Friday and Saturday *viâ* Lyons and Dijon, which conclude the trial, are over more or less uninteresting country.

An interesting article on portions of the route appears in last week's issue of *The Light Car*.

There are now four international teams entered.

The International Six Days Trial.—

LIST OF ENTRIES.

CLASS A.

350 c.c.

Hugh Gibson (Clyno)
P. S. Brady (Douglas)
Klein (Terrot)
Chevallier (Terrot)
Frank May (A.J.S.)
Vuilliamy (Alcyon)
Closs (N.S.U.)
T. C. de la Hay (Sunbeam)
—— (Austral)
Mangis (Douglas)
Progin (Motosacoche)
A. G. Fenn (Levis)
Lehmann (Alcyon)

Up to 500 c.c.

Plan (Peugeot)
Perrin (Peugeot)
Lacroix (Peugeot)
Desvaux (Peugeot)
Lewis (P. and M.)
G. A. Gregson (B.A.T.)
C. P. Finn (Enfield)
Cuzeau (Terrot)
—— (Terrot)
M. C. Breese (B.S.A.)
Naas (Clement)
Honel (Clement)
G. Fenton (Gladiator)
Leoyer (Gladiator)
J. Stuart White (Bradbury)
Stoffel (Alcyon)
R. W. Follet (Triumph)
Vernon Busby (Sunbeam)
R. Bloch (New Hudson)
Lavanchy (Motosacoche)
Grapperon (Grapperon)
J. J. Sproston (Sunbeam)
Karl Don (Zenith)
Graham Price (B.A.T.)
—— (Ariel)
E. H. Lees (A.B.C.)
Bellsham (Zenith)
Swift (Bradbury)
W. B. Little (Premier)
Urban (Wanderer)
W. F. Newsome (Triumph)

CLASS B.

Sidecars up to 500 c.c.

Lombard (Gladiator)
Lassave (Herdtle-Bruneau)
Delaunè (B.S.A.)

Up to 750 c.c.

Frank Smith (Clyno)
Clifford Wilson (Quadrant)
Gex (Motosacoche)

Up to 1,000 c.c.

C. R. Collier (Matchless)
H. V. Colver (Matchless)
R. A. Bishop (Enfield)
Gassert (N.S.U.)
L. A. Bollack (New Hudson)

CLASS C.

Cycle Cars.

H. F. S. Morgan (Morgan)
M. Violet (Violet-Bogey)
—— (Baby Peugeot)
—— (Baby Peugeot)
—— (Baby Peugeot)
W. Chater-Lea (Chater-Lea)
Vincent (Violet Bogey)
Bourbeau (Bedelia)
Mahieux (Bedelia)
C. Pressland (Crouch Carette)

In addition to the British, French, and Swiss International teams, Germany has now nominated a team to defend its colours in the contest for the manufacturers' 200 guinea trophy. The riders selected are :

Closs (350 c.c. N.S.U.)
Urban (500 c.c. Wanderer)
Gassert (N.S.U. sc.)

Streatham Club's Open Hill-climb

AT SOUTH HARTING.

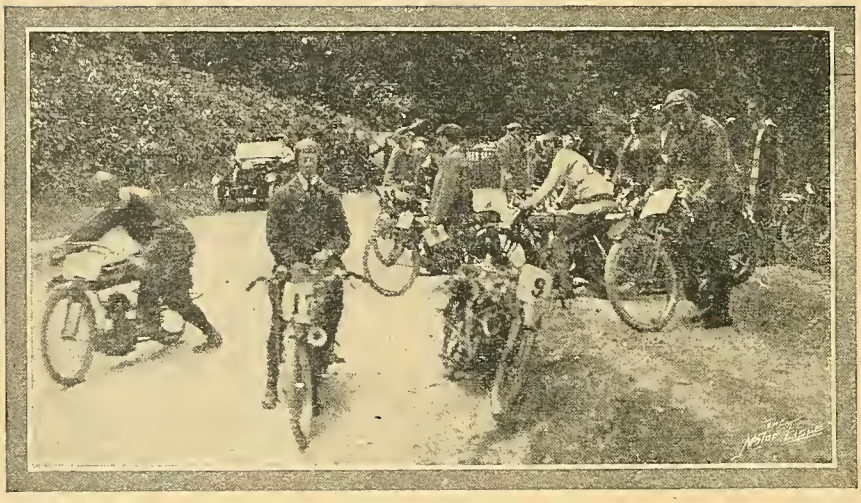
DURING the past few weeks South Harting Hill has been the scene of many hard-fought hill-climbing contests, alike for cars, cycle cars, and motor cycles. Consequently, its surface is beginning to show some traces of wear, but for the average test hill it is quite good. It is an ideal spot for such events, as the country around is magnificent, and the natural grand stands formed by the banks at the roadside give one a chance to view a very large portion of the hill. Quite a large audience collected, and the prospect of a good afternoon's sport was not marred in any way by the threatening climatic conditions, as the natural shelter provided by the trees was excellent. We were pleased to see F. W. Barnes taking part once again in competition work, as this is his first appearance since he sustained a nasty accident some time back whilst piloting the Royal car to Brooklands. F. G. Meeten opened the meeting by putting up an excellent climb on his little 2 O.K. Junior, and the way in which he has tuned up its microscopic power unit is very commendable. Similar remarks can also be applied to G. Radley with his 2½ New Imperial, which obtained premier award in Class IIb. Class III. was essentially an exhibition of efficiency (*i.e.*, power developed for cubical capacity) and some really fast ascents were witnessed. Amongst the notable ones should be included H. R. Davies (2¾ Sunbeam) and F. Thompson (2¾ Douglas). Several of the competitors would have done very much better if they had paid more attention to their gears, as a large number suffered from overgearing. A well deserved win for H. R. Davies on a 2¾ Sunbeam was the result of the next event, and he was followed up closely by F. Thompson (2¾ Douglas) and H. E. Startin, who bestrode a similar machine.

SCENE AT THE FOOT OF THE HILL.
G. Radley (2½ h.p. New Imperial) starting in Class VII.

H. R. Davies, who won Classes III. and IV. riding a 2¾ h.p. Sunbeam.

High Speed in the 500 c.c. Class.

Class V. provided a few thrills on the first bend, for the 500 c.c. engine is still the favourite, and in this case could get into stride quicker than the larger machines. Consequently, the difference in their average speeds was very slight. Cornering was mere child's play to Le Vack (3½ Motosacoche) and C. T. Newsome (3½ Rover), but T. V. Harrison, whose Triumph is said to attain a speed of over 70 m.p.h., found the greatest difficulty in negotiating the first turn,



Competitors in the Streatham Club's hill-climb returning to the foot of the hill after the finish of Class VIII.

doing some most alarming skids, which he corrected with great skill. Newsome's Rover was going in fine form, and obtained a place in nearly every possible class. It was very easy to see that F. W. Barnes was out of form, for he did not give his usual display of dash and daring. After this point of the meeting had been reached, interest began to flag, as there was not much excitement in watching the same men going up and down time after time without any spectacular effect. M. C. Breese is to be complimented on the success of his 3½ B.S.A., which pulled up a sidecar and passenger at a splendid speed. The compression ratio of his engine has been raised slightly, and it is quite evident that beneficial results have accrued therefrom. The fastest time of the day was put up by S. B. Briggs on an 8 Campion in Class X. There were, of course, one or two of the usual breakages to which racing machines are prone, for H. Le Vack sheared the feather on his engine sprocket shaft, while J. G. Grenfell broke some piston rings. The cycle car class was not well represented, but the Cardens were very much in evidence.

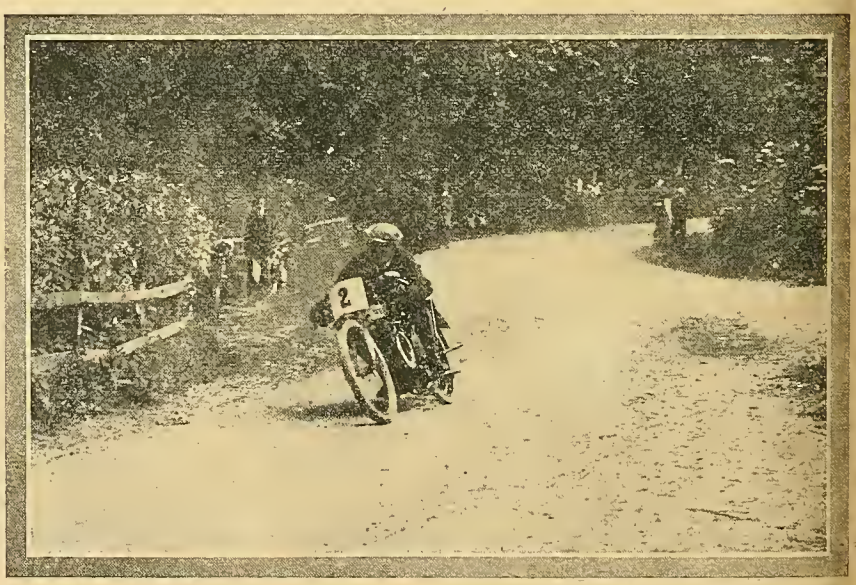
The International Six Days Trial.

Members of the staff of this journal are now on their way to Grenoble in connection with next week's International Six Days Trials. A start was to be made from Havre this (Thursday) morning, and a number of the trials competitors had arranged to journey across France with *The Motor Cycle* party. Others, however, preferred the train, so that their machines would be in the best of condition on arrival at Grenoble. There are about seventy entries for the trial.



T. Thompson (2¾ h.p. Douglas) rounding the second bend of Up Park Hill.

A New Model Hazlewood.

Three-speed Counter-shaft Gear, Enclosed Kick-starter, Chain and Belt Drive, and Black Finish.

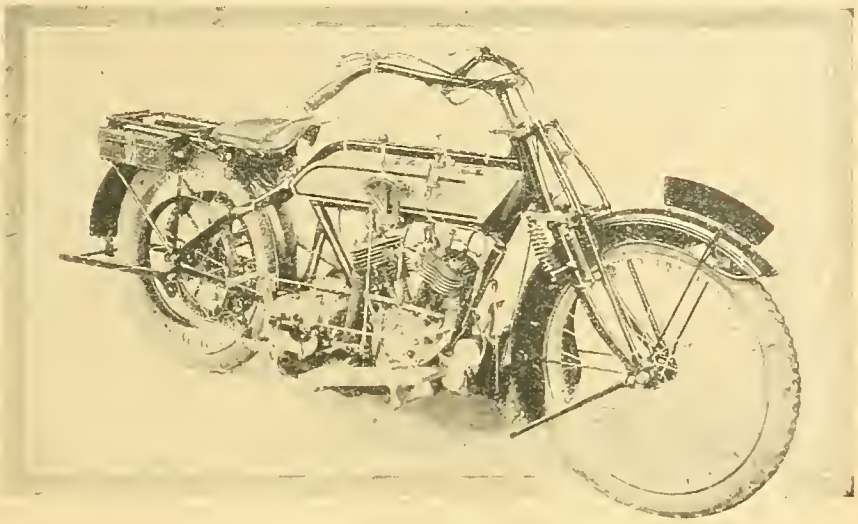
ANOTHER addition to the ranks of the counter-shaft geared machines is the latest type of 5-6 h.p. Hazlewood. In its general features it greatly resembles the present type, for the 70 × 85 twin J.A.P. engine is retained, and the brake construction, mudguarding, footboards, and detail work follow the distinctive Hazlewood lines. Two interesting features are included, however, besides the gear, and these are the special wide heavy rims, which are very strong and easy to clean, and the cozletised finish which is employed on all parts which are usually neglected or are hard to clean.

The frame in the neighbourhood of the gear is specially strengthened by an auxiliary down tube; this with the substantial plate, to which the box is bolted, forms a strong triangulated member.

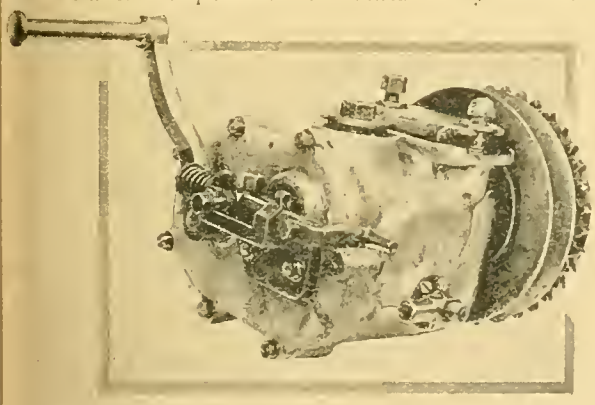
The gear box itself is stoutly constructed, and provides three ratios. It runs throughout on ball bearings with special oil retainers, and has only one sliding member, composed of a central gear wheel with a dog clutch on either side.

The layshaft is machined from the bar, and throughout only the finest materials are used. The kick-starter is of the gear and quadrant type, with the first teeth of the quadrant well backed off to ensure an easy engagement. The whole of the kick-starting mechanism is enclosed in the gear box casting, and a very sensible refinement is the large diameter oil filler which allows thick oil to be poured in without any difficulty. The clutch is of the five-plate cork insert type, the plates being held together by a single spring, and forced out of engagement by a simple and easily adjusted arrangement of wedge bar and slide. Both hand and foot operation will be fitted as standard.

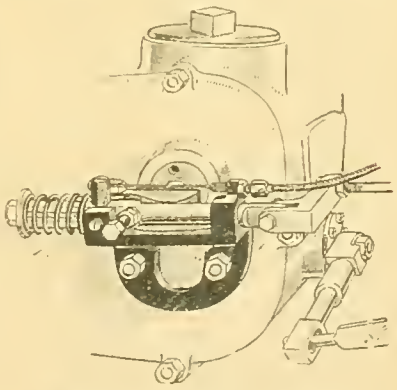
Extensive road tests have proved very satisfactory, and the gear is now being produced in quantities.



Valve side of the latest counter-shaft-geared Hazlewood.



Gear box on the Hazlewood, showing the operating mechanism.

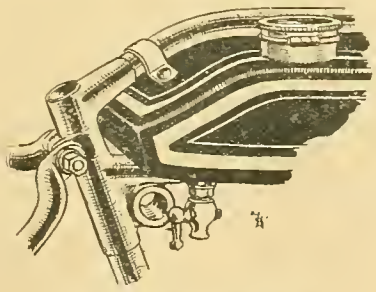


The clutch withdrawal mechanism of the new three-speed Hazlewood counter-shaft gear. Observe the hand and foot controls and large filler cap.

NORTON PROGRESS.

ONE can never chat for long with Mr. Norton without hearing something of interest, and on the occasion of our last visit to his works he had much to reveal.

The latest novelty is a cylinder which may be used continuously under fairly heavy load and yet remains so cool that one can bear one's hand on the cooling ribs. Naturally, the construction remains a secret, and to the outward eye there is nothing unusual in the design. A 350 c.c. engine is on the stocks, but the firm have no intention of marketing the machine, at any rate for the present, and it is being built up purely as an experiment. On the other hand, as soon as time and pressure of business permit, Mr. Norton intends to continue the manufacture of the little two-stroke which appeared on his stand at Olympia under the name of the Nortonette, as long ago as 1910. The design will be somewhat altered, but the main features will be the same.



Dropped top tube, sidecar lug and black tank of the 1915 Norton.

We were lucky enough to see an advance model of the 1915 T.T. type, which is undergoing tests. The frame has a dropped top tube and flush lugs are no longer employed. The engine remains practically the same, but the long exhaust pipe has a tubular expansion chamber welded into it. In the future all Norton frames will be made up with sidecar lugs brazed in, and the finish will probably be in black and gold. A three, or possibly a four-speed, gear box is to be fitted to touring models, and experiments are at present being carried out with various types of gear

Four International Teams.

Germany having nominated a team for the International Trial in France next week, four countries will compete for the valuable trophy which the Motor Cycle Manufacturers' Union presented, and which was won by Great Britain in the Lake District last year.

News from the Continent.

In the Val Suzon hill-climb Verpault (Douglas) made the fastest time in the 350 c.c. sidecar class. In the Susa-Mont Cenis hill-climb Lavanchy (Motosacoche) covered the course of 22 km. 200 m. in 23m. 26⅕s. In the 500 c.c. class Bordino (Motosacoche) made the fastest time, covering the distance in 21m. 29⅖s. A Baby Peugeot in the cycle car class accomplished the distance in 32m. 3s.

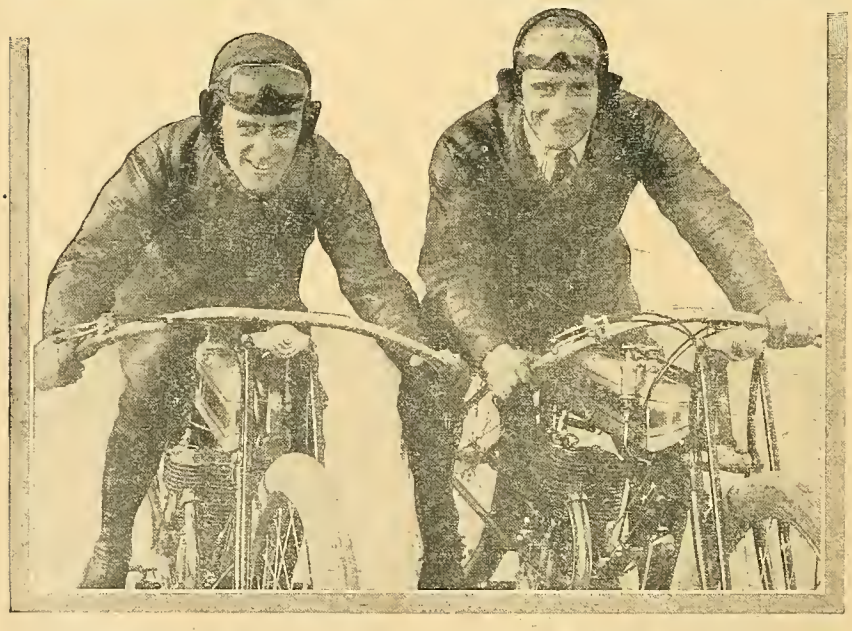
Australian Reliability Test.

A trial from Melbourne to Ballarat and back took place last month. Anthony's Cutting was the observed hill. Out of forty starters only two failed to finish. W. E. Edney (3½ N.S.U.) won the solo section, with H. Shacklock (3½ Rudge) and A. Monkhouse (3½ Singer) tying for second place. K. Walker (7 Indian) secured first place in the sidecar class.

The International Trials Course.

L. A. Bollack, a well-known French motor cyclist, who has taken part in many English competitions, writes:

"All riders who have been over the course say that no one will get through without losing marks, as it is impossible to keep up the average speed, but the truth is, with fine weather it *is* possible, but in wet weather accompanied by fog (as it always is) it is absolutely impossible. I think that the English riders who come to the French trial for joy rides on flat roads will have rather a shock!"



G. E. Stanley and J. Cocker together again, though on a different type of mount. They have long been known as expert engine tuners, having made history with Singers. They made their first appearance on Triumphs at Brooklands last Saturday, when they at once showed that they were in winning vein.

SPECIAL FEATURES.

IGNITION AND LIGHTING.

THE SIX DAYS TRIALS COURSE.

THE MOTOR CYCLE AND THE COUNTRY TRADESMAN.

Liverpool-London-Liverpool.

The A.C.U. has granted a permit to the Liverpool A.C.C. for its twenty-four hours open trial, starting at three points—Liverpool, Stonebridge Hotel, and Barnet. (Meals will be taken at these points.) Forty miles will be non-stop and three minutes allowed each way at each of the four controls. The latest date for entries is August 8th.

A.C.U. Notes.

ANGLO-DUTCH TRIAL.—The third Anglo-Dutch Trial is due to commence on September 6th next. The A.C.U. is desirous of sending a team of ten private owners and ten trade representatives to represent Great Britain. One of the above in each class will be a reserve, and the actual team will comprise:

Three private owners and three trade riders of 350 c.c. machines.

Three private owners and three trade riders of 500 c.c. machines.

Three private owners and three trade riders of passenger combinations.

The A.C.U. will be glad to receive intimation from any rider willing to take part in the trial. Should a greater number of applications be received than the number required, the selection will rest with the A.C.U. Those willing to take part in the trial should, therefore, communicate with the Secretary of the A.C.U., at 83, Pall Mall, London, S.W., without delay.

ONE MAKE TRIALS.—The attention of the A.C.U. has been drawn to the fact that motor cycle agents have on two or three recent occasions organised competitions confined to riders of the particular make of machine which they represent. Although the Union feels that such competitions should not be encouraged, in any case it is essential that they should be run by the promoters under the open competition rules of the A.C.U. Those who compete are therefore warned to take precautions to satisfy themselves that any such trial is being held in accordance with these rules, and manufacturers and agents are warned that any breach of these rules may involve the disqualification of the offending parties.

A Zealous Policeman.—An interesting case has recently come before the Legal Department of the A.C.U. A member recently left his machine in the street whilst he went about his business; upon returning, a police officer drew his attention to the broken cable of the front brake of the motor bicycle, and stated that he intended to report the rider for not having his motor cycle equipped with two independent brakes in working order, as required by law!

International Cycle Car Race.—In addition to the eleven entries announced last week as having been received by the Auto Cycle Union for the International Cycle Car Race to be held in the Isle of Man on Thursday, 24th September next, the following additional entries, making seventeen in all, were received up to Friday, 24th July:

J. M. Barratt (9 Tweenie).
Woodrow and Co. (10 Woodrow).
Woodrow and Co. (10 Woodrow).
E. B. McManus (12 Buckingham).
N. F. Holder (10 Merlin Blumfield).
E. C. Gordon England (10 Marlborough).
H. Jones (Tweenie).
Morgan Motor Co. (two Morgans).
J. F. Buckingham (12 Buckingham).
Auto Carriers, Ltd. (three A.C.'s).
Bamford and Martin (10 Singer).
M. H. Samuelson (8 Marlborough).
M. Leveque (8 Tweenie).

A total entry of about thirty cycle cars in all is anticipated. Entries at ordinary fees closed yesterday (Wednesday).

As *The Motor Cycle* predicted at the time the regulations were issued, the event is mostly composed of light car entries.

Carts Without Rear Lights.

P. C. Douglas, who had entered his Blackburne for the French Grand Prix Race next month, will be a non-starter, as he has, unfortunately, sustained a bad collision with a market gardener's cart at Hounslow after dark, no tail light being fitted to the cart in question. Here is another opportunity for the C.T.C. to shine.

Police Trap.

We are informed that a police trap is in operation on the road between Coventry and Tile Hill. There is but little motor traffic on this road, but those who do pass this way are advised to ride carefully past the row of cottages where children are generally playing in the road, and to look out for cattle, which are often allowed to graze by the hedges.

N.W.A.A. Event Abandoned.

Still another open event has been abandoned. The North-Western Automobile Association committee decided to abandon the Manchester to Brooklands event arranged for this week-end, and are returning entry fees in full to all entrants. There is no doubt that the multiplicity of competitions is telling its tale upon entry lists. This is the second open event in successive weeks which has been struck off.

FUTURE EVENTS.

Aug. 3-9.—F.I.C.M. INTERNATIONAL SIX DAYS TRIALS Grenoble as a centre.
" 14-15.—Liverpool A.C.C. Open Trial to London and Back.
" 15.—French Grand Prix Motor Cycle Race near Le Mans.
" 15.—Essex M.C. Race Meeting at Brooklands.
" 19—Cambridge and District M.C.C. Open Trial.
" 22—B.M.C.R.C. Race Meeting.
" 22—A.C.U. East Midland Centre Open Trial.
Sept. 6-9.—ANGLO-DUTCH TRIAL IN HOLLAND.
Nov. 23-28—Motor Cycle and Cycle Car Show at Olympia.

Ruling the Roast.

Several readers have drawn our attention to what is apparently an error in our leaderette of last week, in which we made use of the expression "Rule the Roast." Of course, the more common quotation is "Rule the Roost," but this is really a corruption of the original, and possibly readers may be interested to know that the origin of the quotation "Rules the Roste" belongs to John Skelton, in his lines to Colin Clout, towards the close of the fifteenth century. Later on, however, Shakespeare, in his play "King Henry VI.," refers to "Suffolk, the new made Duke that *rules the roast*." The same spelling is adopted by Sir Philip Sidney, Thomas Heywood, and Edward Hall. It would appear that there is no authenticity of the term "Rule the Roost." Dr. E. C. Brewer, in his "Dictionary of Phrase and Fable," says: "It is usually thought that 'Roast' in this phrase means *roost*, and that the reference is to a cock, who decides which hen is to roost nearest to him"; but the subjoined quotation favours the idea of a council, "John, Duke of Burgundy, rules the roast, and governed both King Charles . . . and his whole realme."

A Hill-climb Fourteen Miles Long.

The times in the annual Susa-Mont Cenis hill-climb (referred to on previous page) are detailed below. The measured distance was 22.8 kilometres, with a rise of 1,435 metres. Motosacoche riders scored another striking success, not only winning the team prize but occupying first place in both classes, and incidentally checking the Della Ferrera, a machine of Italian construction, which has performed very conspicuously of late. The results are appended, and it will be observed that in both classes the previous time record was beaten.

T. V. Harrison (Triumph), who proved the winner of Class VIII. in the Streatham hill-climb on Saturday, and at the early morning hill-climb of the Sutton Coldfield A.C. on Monday accomplished fastest time of the day.

350 c.c. Class.

		m.	s.
1.	Lavanchy (Motosacoche) ...	23	26⅗
	(Beating previous record, which was 24m. 11s.)		
2.	Malvisi (Motosacoche) ...	24	8⅘
3.	Musso (Della Ferrera) ...	24	25⅖
4.	Olivari (S.I.A.M.T.) ...	24	26⅖
5.	Guesa (Senior)	25	35⅖
6.	Maffeis (Motosacoche) ...	26	48⅖
7.	Semeria (S.I.A.M.T.) ...	26	57⅖
8.	Vigna (Douglas)	28	45
9.	Bonasso (Douglas)	29	4
10.	Temperino (Terrot) ...	29	27
11.	Pregliasco (Douglas) ...	39	52

500 c.c. Class.

		m.	s.
1.	Bordino (Motosacoche) ...	21	9
	(Beating previous record, which was 22m. 32⅘s.)		
2.	Della Ferrera (Della Ferrera)	21	23
3.	Valenzano (Della Ferrera)	23	3⅗
4.	Locatelli (Motosacoche) ...	23	39⅕
5.	Nosenzo (Della Ferrera) ...	25	21⅖
6.	Gianolio (Motosacoche) ...	27	23⅖
7.	Maffeis (Moto-Reve) ...	27	39⅖

There were several falls, which specially delayed Vigna, Maffeis, and others.

There was also a cycle car class, in which three Baby Peugeots competed, the first one finishing in 52m. 3⅖s.

Guide to Prices of Second-hand Motor Cycles.

Those of our readers in want of a second-hand motor bicycle for the holidays should peruse the following average prices asked for second-hand models of the makes named, in the last issue of *The Motor Cycle*.

Make of Machine.	H.P.	Sidecar or Solo.	Gears.	£	s.

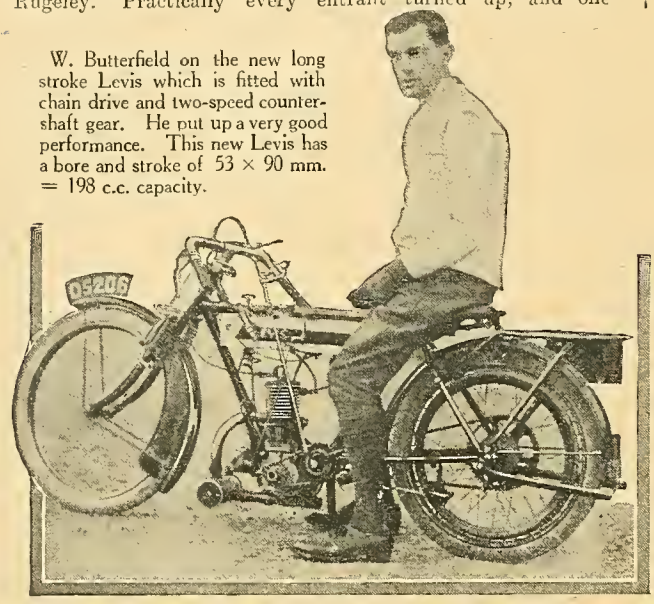
HILL-CLIMBING AT 5 A.M.

Sutton Coldfield and Mid-Warwickshire A.C. Members' Event at Style Cop.

Although the competition started at the early hour of 5 a.m. a large entry was obtained for the Sutton Coldfield hill-climb, run off on the 27th inst. at Style Cop, near Rugeley. Practically every entrant turned up, and one could not but admire the keenness of those who rode out from Birmingham and the surrounding districts on the morning of the event.

Mention should be made of the brilliant riding of T. V. Harrison (5½ h.p. Triumph), who made fastest time of the day, surmounting the hill in the remarkable time of 44⅘s. Results :



W. Butterfield on the new long stroke Levis which is fitted with chain drive and two-speed countershaft gear. He put up a very good performance. This new Levis has a bore and stroke of 53 × 90 mm. = 198 c.c. capacity.

	Time.	secs.	Formula.

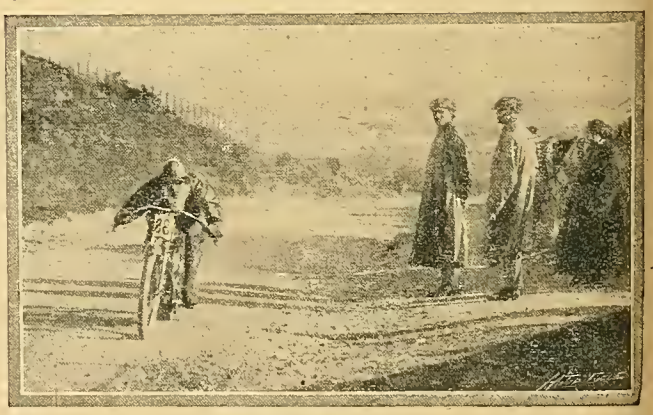
A 2,000 Miles Trial in 1915?

IT will be noticed that the Auto Cycle Union has at last modified its trials policy on the lines so constantly advocated by this journal. In past years the routes have been plotted with an eye on the sentimental rotundity of a thousand miles, and scientific comparative tests, designed to throw the merits and demerits of particular machines into high relief, have been the exception rather than the rule. This year the mileage was reduced by over 300 miles, and the time thus economised devoted to precise tests calculated to distinguish the best from the second-rate.

There are, however, but two objections to the longer distance. One is that if 1,000 miles are to be covered in a week there is no leisure for precise tests of such points as brakes, flexibility, speed, petrol consumption, and finishing condition, while the distance is not sufficient to atone for the absence of these tests. The other is that the riders are disgusted when they near the trials centre after a long day, and on arriving within five or ten miles of it, are despatched over a thirty miles *détour* to pile up distance.

A Scotchman made an admirable suggestion to me the other week. He reminded me that just before large motor cars became too reliable to profit by ordinary non-stop trials, the R.A.C. organised a grand climax in the form of a 2,000 miles trial, which proved to be a magnificent advertisement, and taught the trade many invaluable lessons. Now motor cycle trials are likely to continue far longer than car trials, partly because we hope to go on reducing the weight of motor cycles almost indefinitely, partly because a long string of cars are a public nuisance in dusty weather, whereas motor cycles are not. So my friend suggests that in alternate years the A.C.U. and the Edinburgh and District M.C. should each run a separate six days trial, with a limited mileage and precise tests of all the details which constitute excellence in a motor cycle; and that in alternate years the two sets of organisers should combine to organise a 2,000 mile twelve days trial, six days south of the Border and six days north of it. The wide area covered in such a trial would save the men the irritation of ceaseless *détours* on flat roads; *and the distance would be sufficiently extensive to constitute a test in itself.*

There are obvious difficulties in the plan, but I mention it as a desirable ideal. ROAD RIDER.

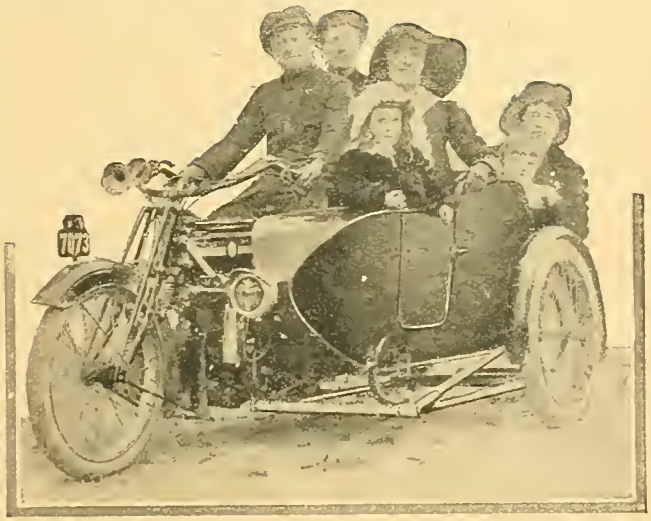


T. V. Harrison (Triumph) nearing the summit of the hill in the Sutton Coldfield climb. The long shadows across the road indicate the early hour.

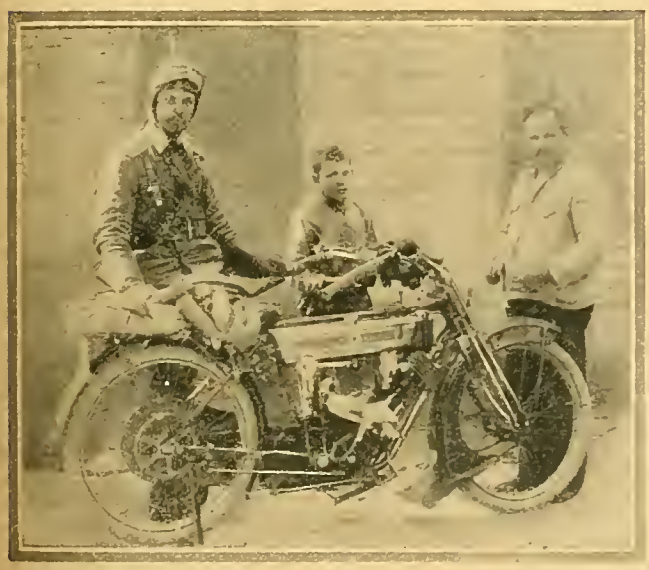
Road Racing in Italy.

The extraordinary popularity of motor cycle racing in Italy is exemplified by the holding, nearly every week, of an important road race. This invariably attracts large entries, and a considerable percentage of the competing machines are British. This has given a considerable fillip to English trade, and already proof has been afforded us by several manufacturers that considerable orders are coming in from Italy.

Recently the Circuito dell'Appenino Toscano was decided near Bologna over a distance of 107½ miles, the course being hilly and with many sharp corners. The race, which consisted of classes for 500 c.c. and 350 c.c. machines, resulted in a triumph for the Della Ferrera machines, one ridden by Della Ferrera winning the 500 c.c. class, and another, in the hands of Musso, coming in first in the 350 c.c. class. These machines have been very successful in their races this year. In the Junior section, Douglas machines came in second, third, fifth, and seventh, and gained the team prize. Rudge, Triumph, Premier, and Ariel represented England among the Seniors, MacDonagh securing third place on the Rudge. Only two minutes separated the first four men, so it will be seen the contest was very keen.



An Italian owner of an 8 h.p. Rex-Jap sidecar who recently accomplished a climb six kilometres in length (the gradients varying from 1 in 7 to 1 in 5) with five passengers.



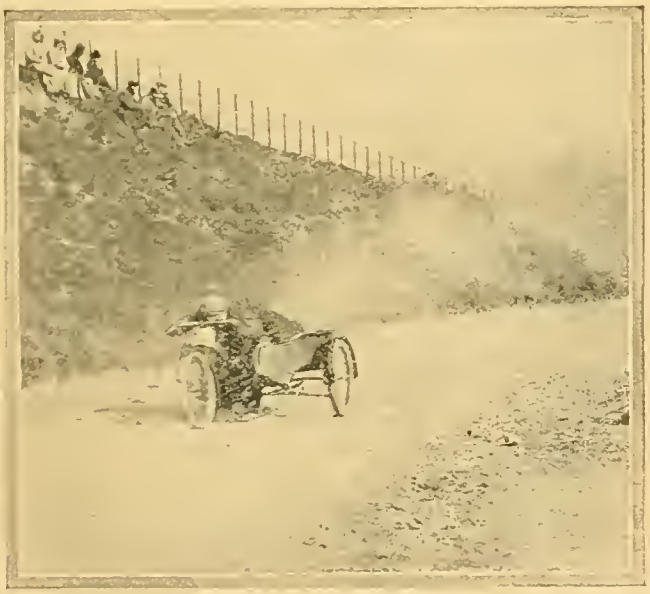
MOTOR CYCLE COMPETITIONS IN RUSSIA.

Lieut. N. W. Khalioutyn, who has been awarded the first prize for military motor cyclists, for the best condition of the machine at the finish of the recent Moscow-St. Petersburg-Moscow trial, held by the Moscow Club of Motorists. Lieut. Khalioutyn's machine is a P. and M

STREATHAM OPEN HILL-CLIMB RESULTS.

Below we give the winners on formula of the various classes—experts and general. An account of the climb and the results on time will be found on pages 159-160.

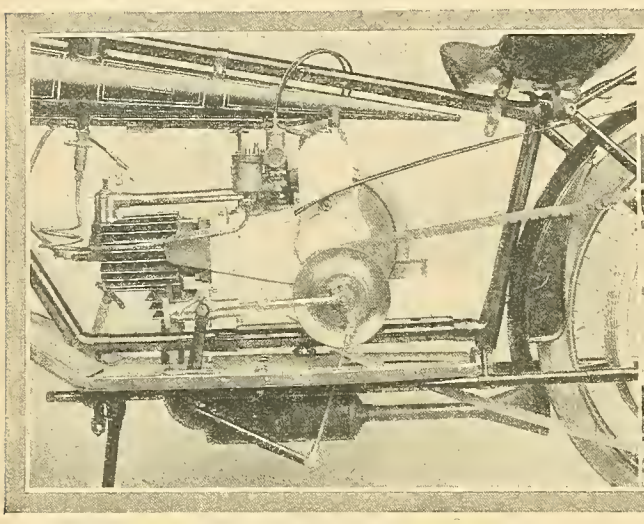
CLASS 1A.—General: Meeten (2 O.K.).
CLASS 1B.—Expert: Radley (2½ New Imperial).
CLASS 2B.—Expert: Radley (2½ New Imperial).
CLASS 3.—General: Thompson (2¾ Douglas). Expert: Davies (2¾ Sunbeam).
CLASS 4.—General: Thompson (2¾ Douglas). Expert: Davies (2¾ Sunbeam).
CLASS 5.—General: Le Vack (3½ Motosacoche). Expert: Newsome (3½ Rover).
CLASS 6.—General: Hardman (3½ Rudge). Expert: Newsome (3½ Rover).
CLASS 7.—General: Kennedy (4½ Zenith). Expert: Newsome (3½ Rover).
CLASS 8.—General: Boxer (6 Bat). Expert: Harrison (3½ Triumph).
CLASS 9.—General: Brooke (7 Indian). Expert: Harrison (3½ Triumph).
CLASS 10.—General: Brooke (7 Indian). Expert: Brigg (8 Campion), and fastest time of the day.
CLASS 11.—General: Breese (3½ B.S.A.). Expert: Breese (3½ B.S.A.).
CLASS 13.—General: Boxer (6 Bat). Expert: Barnes (6 Zenith).
CLASS 14.—General: Boxer (6 Bat). Expert: Barnes (6 Zenith).
CLASS 15.—General: Breese (3½ B.S.A.). Expert: Barnes (8 Zenith).
CLASS 16.—General: Frost (8 Matchless). Expert: Barnes (8 Zenith)
CLASS 17.—Humphries (Carden).
CLASS 18.—Carden (Carden).



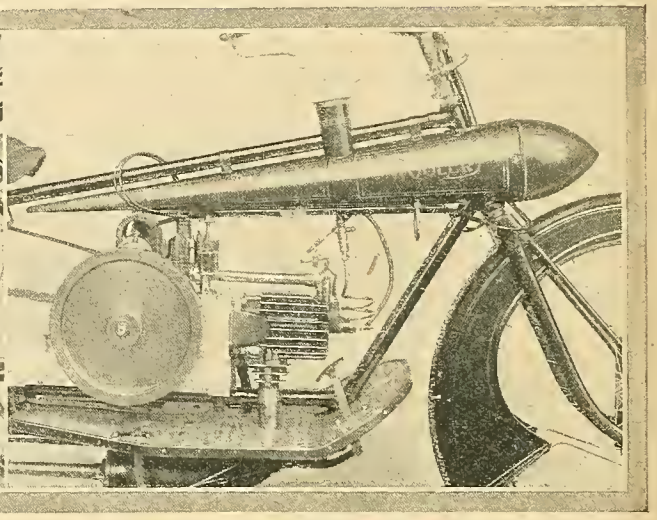
E. Smith (Regal-Green sidecar) crossing the finishing line at full speed in the "five o'clock hill-climb" of the Sutton Coldfield club.

The 2¾ h.p. Two-stroke Wooler.

AN INTERESTING MACHINE, EMBODYING MANY DISTINCTIVE FEATURES.



Pulley side of the engine showing belt tensioning device for variable gear.

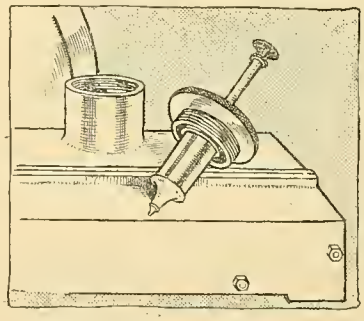


The horizontal Wooler without side flywheel and footboards.

THE Wooler has been on several occasions referred to in *The Motor Cycle*, and now the company has secured premises in Old Oak Common Lane, Willesden, for its manufacture.

Dealing first with the power unit, it may be remembered that the engine possesses many interesting features. It is of the two-stroke variety, the cylinder being placed horizontally, having radiating fins round the union of the exhaust pipe as well as on the cylinder itself. The first compression is made in the end of the cylinder opposite to the combustion chamber instead of in the crank case. The mixture is then transferred to the other end of the cylinder by means of an external pipe, which is clearly shown in the accompanying illustration. Lubrication is effected by means of a pump driven off the crankshaft, which delivers oil through a drip feed lubricator to the cylinder walls and to a jet which sprays oil over the big ends. About one quart of oil, sufficient for two hundred miles, is carried in a separate container behind the crank case, the filler cap of which contains a squirt, which may be used for lubricating the various moving parts of the machine.

A novel arrangement is the interconnection of the drip feed and the throttle, so that the farther the throttle



The oil sump on the Wooler, showing the oil squirt which is incorporated with the filler cap.

is opened the greater the amount of oil delivered to the cylinder, an exceedingly sensible arrangement, which allows the engine to get plenty of oil even though the road speed may be comparatively low.

The bore and stroke are 76 mm. × 76 mm. and the cubical capacity 344 c.c. The compression release valve is situated at the end of the transfer pipe, and when brought into action destroys all suction on the carburetter.

The parts are particularly accessible, and it is interesting to note that the power unit may be dismounted by undoing two nuts, while both the U.H. magneto and B. and B. carburetter can be got at with an equal amount of ease.

The torpedo tank is of neat design and pleasing appearance, and holds a gallon and a quarter of fuel. The illustration of the frame shows its neat construction, and the convenient form of back and front stands employed, while the two lugs for carrying the engine are also clearly seen.

The Method of Springing.

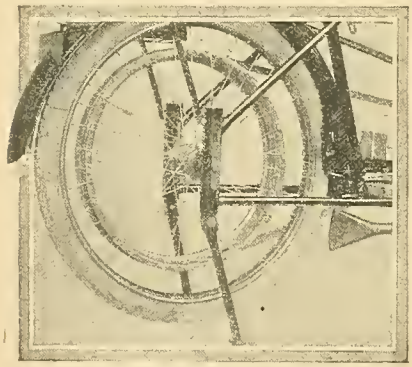
The Wooler is sprung fore and aft, the system of springing being a suspension of the wheel spindles on coil springs. The slots in which the spindles work are protected from dust by felt washers, which also retains the lubrication.

The arrangement of the change-speed gear is one of the most simple, being of the expanding pulley type and giving six forward speeds. The movable flange is worked by means of a quick screw thread operated by a heel and toe pedal.

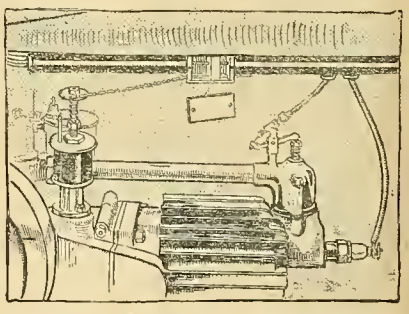
The device shown forward of the gear in the illustration is for the tensioning of the belt. It has a movement of three inches, while tension can be effected by merely undoing a locking screw.

It is interesting to note that the brake rod runs inside one of the horizontal frame tubes, and is thus neatly concealed.

The Wooler is a machine the design of which has been carefully thought out, and is full of novel and interesting details.



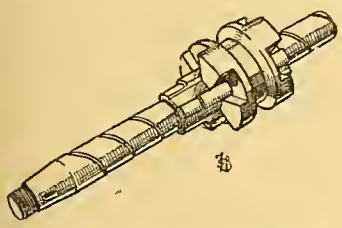
Method of springing the rear portion of the frame.



The interconnected oil and throttle arrangement on the latest pattern Wooler.

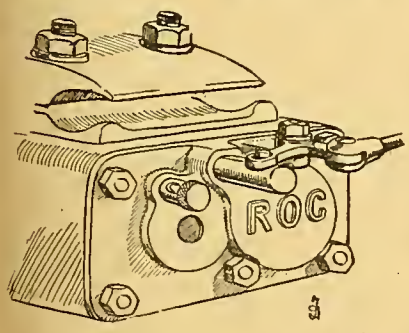
A ROC COUNTER-SHAFT GEAR.

THE name "Roc" has been associated with motor cycle gears from the earliest days, so that it was with some interest that we examined the latest type of counter-shaft two-speed gear manufactured by Messrs. A. W. Wall, of Hay Mills, Birmingham.

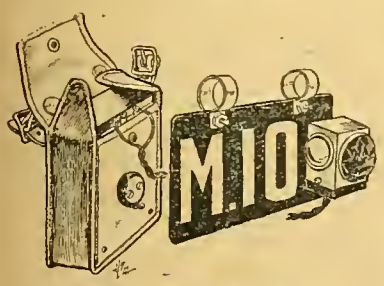


Mainshaft of the Roc two-speed gear showing the projecting alternate dog teeth.

The gear is of the constant mesh type, employing a single pair of sliding dogs to effect the change. A particular feature of these dogs is that every alternate projection is somewhat higher than its neighbour. This is arranged so as to give an easy and positive change, and allows a full quarter revolution for engagement. A short road trial of the device fitted to a small two-stroke showed that the gears are particularly quiet, both on the high and low ratios, while the change can be made with the greatest ease. The construction of the box is very solid, and all parts are strong enough to withstand considerable overload. The main shaft runs on ball bearings and the layshaft on plain. At present the gear is manufactured for use on lightweights only.



The control side of the Roc two-speed counter-shaft gear.



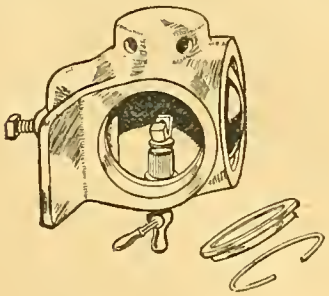
The Eastick electric rear lamp for motor cycles.

A COMPACT REAR LAMP.

One of the neatest and most compact rear lamps we have seen is that produced by Messrs. J. J. Eastick and Son, Clapton Common, N.E. The illustration clearly shows the design of the lamp, which is electric, and the dry battery in its canvas case. This is intended to be strapped on to the carrier, and is provided in front with a small switch for the purpose of turning on the light when required.

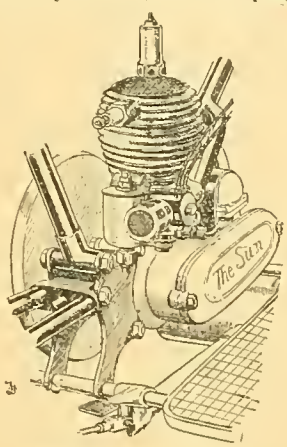
THE DUMOLITE REAR LIGHT.

The Dumolite is a neat and solidly constructed lamp manufactured by A. J. Dew and Co., 21, Endell Street, London, W.C. It consists of a single aluminium casting,



The Dumolite acetylene rear lamp.

into which two glasses—a red and a white—are firmly fixed by spring rings. The white light is arranged to give ample light for the illumination of the rear number plate, while the red glass acts, of course, as a warning to those behind. The burner is screwed into the body of the lamp, and it is almost impossible for any rattles to occur. The lamp is nicely finished, and is very light.



The engine unit of the latest Sun two-stroke

THE P. AND M. TWIN.

With regard to the P. and M. twin-cylinder machine which was described and illustrated in our last issue, Mr. Richard Moore has been riding the first of these models for twelve months and has covered about 7,000 miles on it. In its final form this new P. and M. twin will have a four-speed gear

IRISH END TO END TRIAL

H. Wilhelmj (5-6 h.p. Bradbury sidecar) starting for the slow climb up Iscar Hill. This rider won the special prize for the best sidecar performance, as well as a gold medal

THE B.M.C.R.C. JULY MEETING.

SEVERAL RECORDS BROKEN.

IN spite of a strong breeze which continued throughout the day, several new records were set up for the standing start ten miles and the flying five miles. The first event of the day was the usual series of time trials over the kilometre and mile. The course was ridden in the reverse direction during these trials on account of the wind, and this appeared to worry a few of the riders, for, in spite of the rather favourable breeze, only one record went in this event, E. B. Ware, on his 6 h.p. single-seated Morgan, reducing the kilometre time to 34.36=65.1 m.p.h and the mile to 57.06=63.09 m.p.h. in Class J.

Time trials are rather dull performances to watch, and the chief interest centred round Stanley and Cocker, who made their first public appearance on Triumph machines. The former made the fastest times in his class, though no records fell. He was closely followed by O'Donovan, whose record-breaking Norton had been re-bushed, and was not in quite its best form. Cocker was a good third.

*Record.

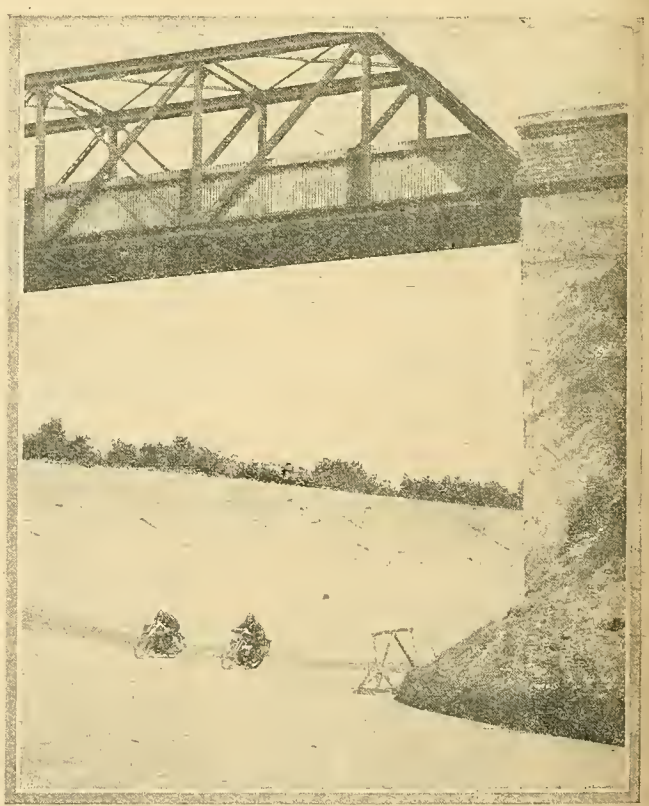
Afternoon Events.

The actual racing started at two o'clock with a ten mile race, starting from the railway straight and finishing at the fork on the fourth circuit. The track was ridden in the usual direction. From the very beginning the race became a three-cornered event between Stanley, O'Donovan, and Cocker, with Bownass (3½ N.U.T.) and Graham Dixon (3½ James) following.

On the first lap Stanley led, with O'Donovan and Cocker at about equal intervals behind. As they passed the fork the second and third times O'Donovan had gradually drawn up and was riding hard on Stanley's heels, and when the riders came into view for the last time it was almost impossible to tell who was in the lead, and both men crossed the line at a terrific speed, the Norton rider winning by his front wheel; the race caused intense excitement and provided one of the closest finishes that has been seen on Brooklands for some time past. This is Stanley's first defeat for about two years, and he told us that he believed the second man to be his stable companion, Cocker, until he was passed in the last lap, too late to regain the lead. Both men rode magnificently. Graham Dixon was using a new carburetter with a flat barrel and apparently an expanding choke tube. S. Yano was riding a Triumph built into a very short, low frame, but apparently had trouble, as he did not come round for some time. In each ten mile event the speeds for the flying five miles were taken, starting from a point behind the members' hill on the first lap. Results :

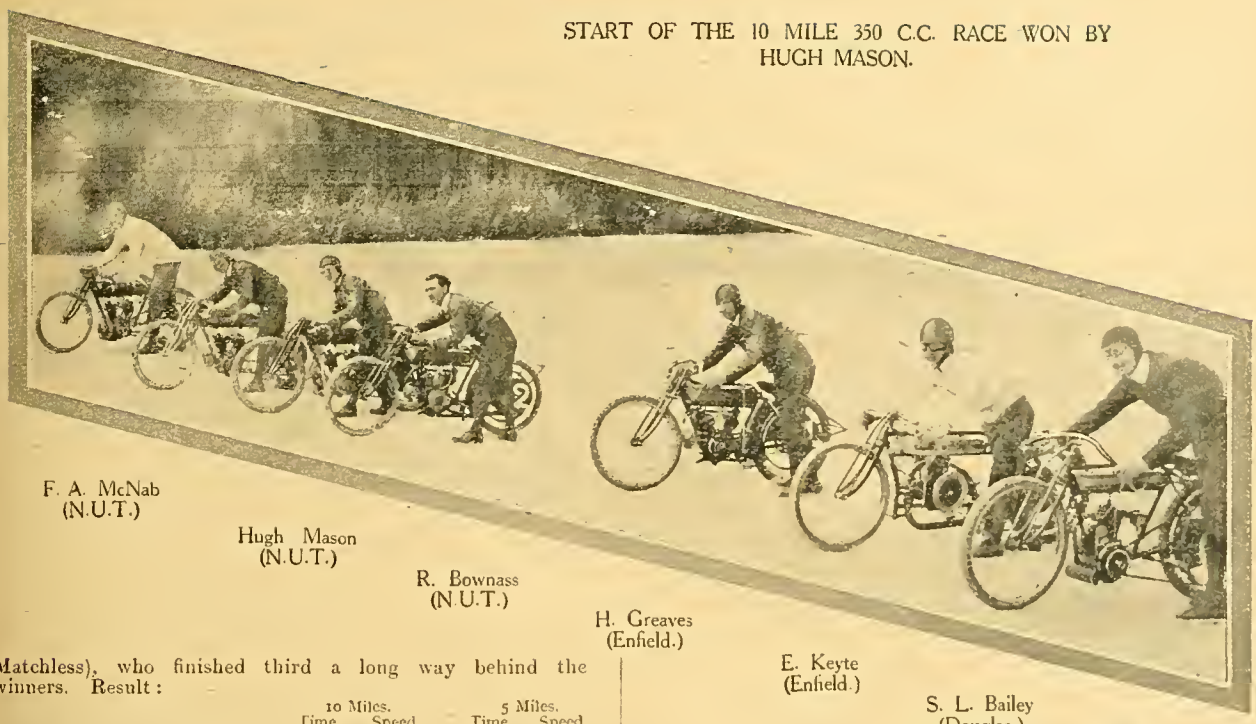
	10 Miles. Time.	Speed.	5 Miles. Time.	Speed.
	M. S.	M.P.H.	M. S.	M.P.H.
D. R. O'Donovan (3½ Norton)	8 34	= 70.31	4 11⅘	= 71.29
G. E. Stanley (3½ Triumph)	8 34⅕		4 11⅗	
J. Cocker (3½ Triumph)	8 49⅘		4 20½	

The next race was over the same distance, but for machines up to 1,000 c.c. Once again the event was most exciting, for S. George on the eight valve Indian and H. Reed on his ported Dot were close together throughout the race, and, though George held the lead nearly all the time, Reed came off the banking faster and made the best time over the flying five miles. A. J. Luce (8 Zenith) lay fourth on the first lap, but was passed by E. Baragwanath (8



A duel under the members' bridge. Often spectators at B.M.C.R.C. meetings who station themselves at the fork miss some of the most interesting and exciting events of the afternoon.

START OF THE 10 MILE 350 C.C. RACE WON BY HUGH MASON.



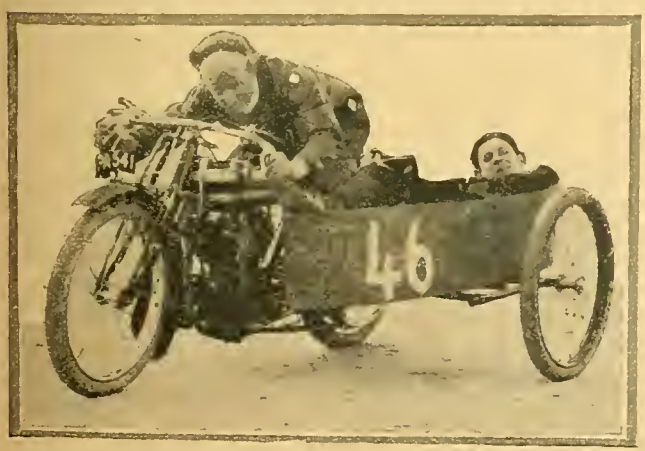
Matchless), who finished third a long way behind the winners. Result:

	10 Miles. Time. M. S.	Speed. M.P.H.	5 Miles. Time. M. S.	Speed. M.P.H.
S. George (7 Indian)	7 46⅘	= 77.56	3 47	
H. Reed (8 Dot)	7 47⅕		3 45⅘	= 79.82
E. Baragwanath (8 Matchless)	12 33⅘		4 9	

The third race over the same course was for machines up to 350 c.c., and did not provide so good a finish, for though S. L. Bailey at once took the lead he dropped out in the second lap with a broken rocker, and Hugh Mason took his place with a good lead from H. Greaves. E. Keyte and R. Bownass followed, and W. A. Jacobs on his little 65 × 75 (248 c.c.) Singer brought up the wear. He was travelling very well considering the size of his engine, and results showed that he broke records for Class A. The positions remained unaltered at the finish. McNab's N.U.T. caught fire in the first lap owing to a terminal coming off, but no damage was done. Result:

	10 Miles. Time. M. S.	Speed. M.P.H.	5 Miles. Time. M. S.	Speed. M.P.H.
H. Mason (2¾ NU.T.)	9 57⅘	= 60.20	4 51	= 61.86
H. Greaves (2¾ Enfield)	10 10⅘			
E. Keyte (2¾ Enfield)	10 36⅘			
W. A. Jacobs's times were	*11 40⅘	= 51.4	*5 44⅕	= 52.20

*Records for Class A.



A. V. Sumner (3 h.p. Zenith sidecar), who in addition to winning the sidecar event broke the five mile sidecar records.

More Records Broken.

The ten-mile cycle car race only produced four starters, and Lionel Martin and E. B. Ware had it all their own way. Ware's little 6 h.p. Morgan was travelling magnificently, and hung on to the Singer in a wonderful way. W. Harriss (Marlborough) was fairly fast, and travelled very smoothly, but Newbold (Warren Lambert) was rather slow. Martin gradually increased his lead, but appeared to miscount his laps, for just before the finish he shut down and drew in towards the finishing straight when Ware could have passed him easily had he not suffered from the same delusion and cut out. In spite of this his times for the five and ten miles are class records. Results:

	10 Miles. Time. M. S.	Speed. M.P.H.	5 Miles. Time. M. S.	Speed. M.P.H.
L. Martin (10 Singer)	10 3	= 59.70	4 51	= 61.86
E. B. Ware (6 Morgan)	*10 5	= 59.50	*4 53⅕	= 61.22
W. Harriss (10 Marlborough)	10 5⅘			

*Records for Class J.

The ten-mile sidecar race for machines up to 500 c.c. proved a runaway event for Cocker. His Triumph was travelling in its best form, and finished about a mile ahead of Holden (B.S.A.), who, in his turn, had a long lead over de Lissa (Motosacoche). Cocker's record speeds rather minimised the performances of the other two machines, which would have been quite fair in the usual field. Results:

	10 Miles. Time. M. S.	Speed. M.P.H.	5 Miles. Time. M. S.	Speed. M.P.H.
J. Cocker (3½ Triumph sc.)	*10 31⅕	= 56.71	*5 10⅕	= 58.06
K. Holden (3½ B.S.A. sc.)	12 22		6 0⅕	
O. de Lissa (3½ Motosacoche)	13 0⅘		6 26⅘	

*Records for Class G.

A ten-mile event for 1,000 c.c. sidecar machines followed, and here again a record fell, Sumner securing the five-mile time for Class I. Luce had magneto trouble and did not start, and Openshaw had plug trouble, which delayed him considerably. Chater-Lea took up the lead and held it well for the first lap, though afterwards his engine seemed to dry up, and Sumner and Taylor came to the front, running very close together. R. H. Hoare, on the C. and H., a Cornish production and a newcomer to the track, had been travelling well, but his engine dried up—a habit well known on Brooklands. Results:

B.M.C.R.C. July Meeting.—

	10 Miles. Time. M. S.	Speed. M.P.H.	5 Miles. Time. M. S.	Speed. M.P.H.
A. V. Sumner (8 Zenith sc.)	11 20⅘	= 52.90	*5 38	= 53.25
C. R. Taylor (8 Zenith sc.)	11 26⅕			

*Record for Class 1.

Sumner's record is all the more meritorious as it was accomplished on one of the first of the new 85 × 85 J.A.P. engines.

Handicap Races.

Out of the thirty-five entrants for the allcomers' three-lap handicap twelve failed to turn up.

The men lined up at the fork and were sent away at intervals according to their handicaps. F. Pigot Disney (2¾ Douglas), F. A. McNab (2¾ N.U.T.), and W. A. Jacobs (2½ Singer) were on the limit mark. But S. L. Bailey, who started thirty-nine seconds later, made a splendid start, and was soon on their heels. As the men passed at the end of the first lap Bailey was travelling at great speed, and looked like a winner, but soon after the fork both he and McNab dropped out with plug trouble. Stanley had crept up several places, and Reed was improving his nine seconds start from George.

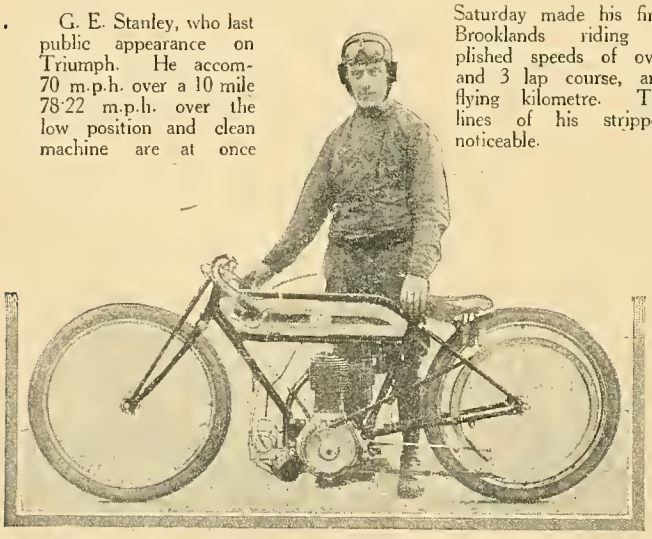
In the second lap Jacobs had run into first place, followed by Keyte (2¾ Enfield), but Stanley was close behind them travelling at a great speed and looked an easy winner. Bownass was fourth, followed by Pigot Disney, Walden (Singer), Graham Dixon (James), McKenna (Norton), Oubershott (Rudge), and Reed, while George had picked up several places. Hugh Mason blew off the rear cylinder head. Stanley finished an easy winner, with Reed, Bownass, Keyte, and George following. Results:

	Speed.
G. E. Stanley (3½ Triumph) 57 secs.	70.28 m.p.h.
H. Reed (8 Dot) 9 secs.	77.16 m.p.h.
R. Bownass (3½ N.U.T.) 1 min. 18 secs.	64.62 m.p.h.

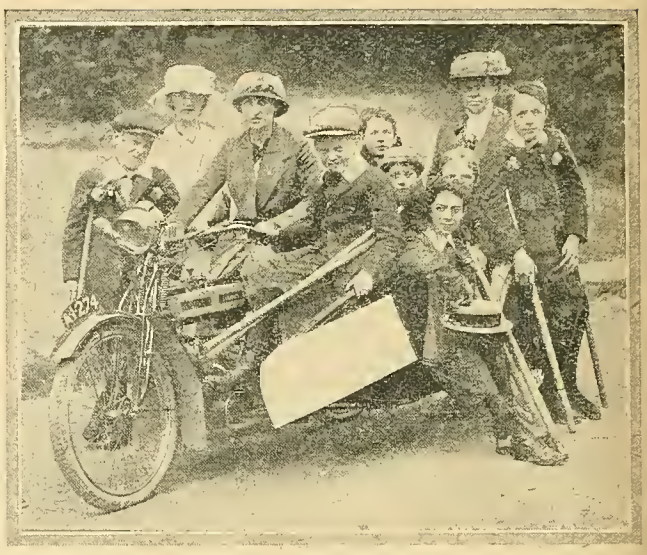
The last event was a three-lap passenger handicap, which was won by H. Greaves (2¾ Enfield sc.) with ease. He started on the limit, having 4m. 33s. start from L. Martin (10 Singer), and was well away on his second lap before the scratch man received the signal to go. He was followed by de Lissa, who afterwards gave way to T. Brown (6 Zenith) and K. Holden (B.S.A.). Luce was working his way up, and Sumner and Martin made a good fight of it, but their handicaps proved too heavy for them. Greaves had hard luck in that though his speed was much better than the record in his class it does not stand, as the race was a three-lap handicap. Results:

H. Greaves (2¾ Enfield sc.)	47.58 m.p.h.
K. Holden (3½ B.S.A. sc.)	50.81 m.p.h.
A. J. Luce (8 Zenith sc.)	56.37 m.p.h.

The meeting was attended by only a moderate number of spectators.



G. E. Stanley, who last Saturday made his first public appearance on Brooklands riding a Triumph. He accomplished speeds of over 70 m.p.h. over a 10 mile and 3 lap course, and 78·22 m.p.h. over the flying kilometre. The low position and clean lines of his stripped machine are at once noticeable.



Mrs. Gordon Fletcher (3½ h.p. Douglas sidecar), who assisted in the Essex M.C. annual cripples' outing.

IRISH END-TO-END RESULTS.

THE results of the Irish End-to-end reliability trial organised by the Motor Cycle Union of Ireland (Ulster Centre), and described on page 126B of our last issue, are given hereunder. Stewart, the well-known Belfast rider who carries off the Palmer trophy on a Douglas, has competed in every End-to-end trial held so far. The team prize was won by the three B.S.A. riders, W. J. Woods, R. Jones, and W. J. Chambers.

	Marks.	Flexibility.
J. Stewart (2¾ Douglas), Palmer Trophy, gold medal, and Shell Cup	156 max	6 secs.
W. Cameron (4 Triumph), 2nd prize, gold medal and special Pratt's prize	150	2 secs.
L. A. Bees (4 L.M.C.), 3rd prize and gold medal	150	2 secs.
W. B. Gibb (2¾ Douglas), 4th and gold medal	150	1⅘ secs.
"Sou'-wester" (2¾ Douglas), lightweight prize and gold medal	150	1 sec.
V. J. Farrell (4 Triumph), gold medal	150	1⅘ secs.
W. J. Woods (3½ B.S.A.), gold medal	150	2⅘ secs.
G. E. Gregson (4½ Bat), gold meda	150	4⅘ secs.
T. Mallon (2¾ Sunbeam), gold medal	150	5⅘ secs.
J. Dwyer (4 Triumph), gold medal	150	8 secs.
A. Wilhelmj (5-6 Bradbury sc.), sidecar prize and gold medal	150	8⅘ secs.
F. Smith (6 Clyno sc.), silver medal	140	8⅘ secs.
C. Jones (3½ B.S.A.), silver medal	140	6⅘ secs.
W. J. Henderson (6 Rudge), silver medal	140	8⅘ secs.
P. J. Fox (3½ Rudge), silver medal	140	Kicked on hill
T. E. Greene (3½ Rudge), silver medal	140	Failed on hill
G. I. Francis (3½ Lea-Francis), silver medal	140	Failed on hill
P. J. Cox (3½ Douglas), silver medal	136	Kicked on hill
W. J. Chambers (3½ B.S.A.), silver medal	130	Failed on hill
Dr. Armstrong (3½ Triumph), silver medal	130	Kicked on hill
J. M. Summerfield (6 New Hudson sc.), silver medal	129	Failed on hill
W. H. Longton (3½ Alldays), silver medal	125	Clean ascent
J. Brown (3½ Rover), silver medal	123	Failed on hill
J. B. A. Day (2½ Sun), silver medal	109	Failed on hill

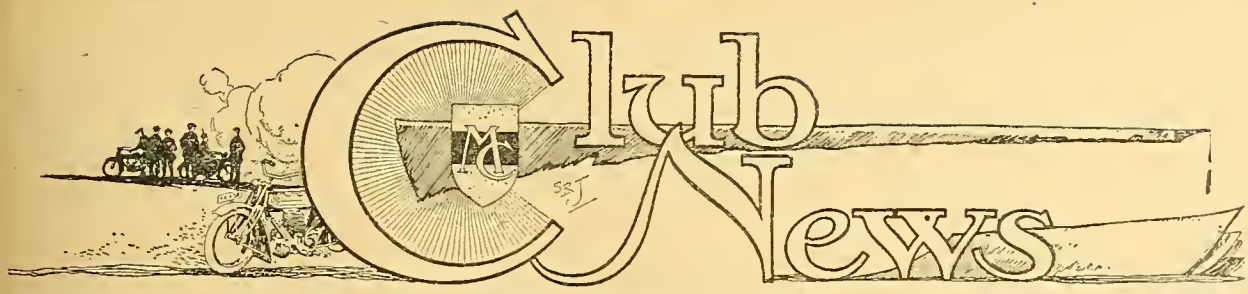
The following were disqualified owing to being ahead of schedule more than ten minutes at any point on the journey: H. Gibson (2½ Clyno), P. Phillips (2¾ Douglas), W. Allen (2¾ Douglas), A. Beatty (2¾ Sunbeam), and C. Hosford (3½ Rover).

SHEFFIELD AND HALLAMSHIRE M.C.C.

The sixth annual trial to Holyhead and back, a distance of 316 miles, took place on the 25th inst. Fifteen riders faced the starter. Of these eight were driving sidecar combinations. The weather was terribly wet and very boisterous. The going over the Cat and Fiddle was exceedingly rough, a thick white mist over portions of the hill, together with the strong westerly wind, making it very trying for the riders, so that only two of them reached the Angel Hotel, Knutsford, to time.

Winner of the Hulton Shield and special award presented by W. H. Pearson, Esq.—S. Sawer (3½ Premier).

Winners of silver medals.—S. Raynes (3¼ Lea-Francis), H. Eggington (6 Excelsior sc.), L. Fisher (3¼ Lea-Francis), F. Ronksley (6 Zenith sc.), R. M. Davy (2¾ Enfield), G. Wilkins (6 Rex-Jap sc.), and E. Thompson (2¾ Douglas).



"THE MOTOR CYCLE" LIST OF CLUB EVENTS

Aug. 1st.—Woolwich, Plumstead, and District M.C.C. Run to Leaves Green Brookdale.
" 1st.—Coatbridge and District M.C.C. Run to Balloch
" 1st.—Mersey (Liverpool) M.C. Run to Brooklands.
" 1st.—Streatham and District M.C.C. Impromptu run.
" 3rd.—Surrey M.C.C. Hill-climb.
" 3rd.—Bury and West Suffolk M.C.C. Run to Felixstowe.
" 3rd.—Cardiff and District M.C.C. Social gipsy outing.
Aug. 5th.—Middlesbrough and District M.C.C. Ladies' day at Marske.
Aug. 5th.—Newport Pagnell M.C. Gymkhana at Tickford Abbey Park

BANK HOLIDAY TOURS.

M.C.C. to Devon.
North-west London M.C.C., to Chichester.
Cyclecar Club, to the Wye Valley.
Westmorland M.C.C., to Portobello.
Bristol B. and M.C., to Land's End.
Finsbury Park C. and M.C.C., to Goring Heath, near Pangbourne.

Leeds M.C.C.

A gymkhana took place on Saturday. The decorated sidecar class was won by Mrs. A. T. Jenkins (4 Triumph).

Malvern and District M.C.C.

An inter-club speed trial will be held on August 15th on Blackmore Park drive, which is perfectly straight and has a good surface. Events will be electrically timed, and there will be eleven classes.

Buckingham M.C.C.

At the invitation of the Triumph Cycle Co. the members visited the factory at Coventry and were much interested in the various processes which they saw. Tea was afterwards provided by the company.

Eastern Counties M.C.

A reliability run was held last week to Yarmouth and back. Ten started, and the following finished to time: S. Chapman (3½ Triumph), A. W. Chapman (7 Matchless sc.), W. Crook (6 Bradbury sc.), and W. A. Booth (6 Ariel sc.).

Derby and District M.C.C.

The reliability trial for the Henmore Cup resulted in a tie between H. Baker (7 Indian), second time holder, and A. Ainsworth (3½ Rudge). The re-run of fifty miles non-stop caused considerable interest, both men being keen riders. The riders were checked every few miles, the result on time being: 1, Ainsworth, time error 7m.; 2, Baker, error 11¼m. Both made non-stop runs.

York County M.C.C.

The annual Leeds-London-Leeds reliability trial was run off most successfully on the 18th and 19th inst. with a record entry. Very little trouble was experienced by the competitors, punctures accounting for most. H. H. Charge won the Byrom Cup, A. C. Thornton the special gold medal, and G. Hemingway the standard gold medal.

Lincolnshire A.C. (Motor Cycle Section)

The results of the hill-climb held on the 25th inst. on the knock-out principle at Scamblesby are as follow:

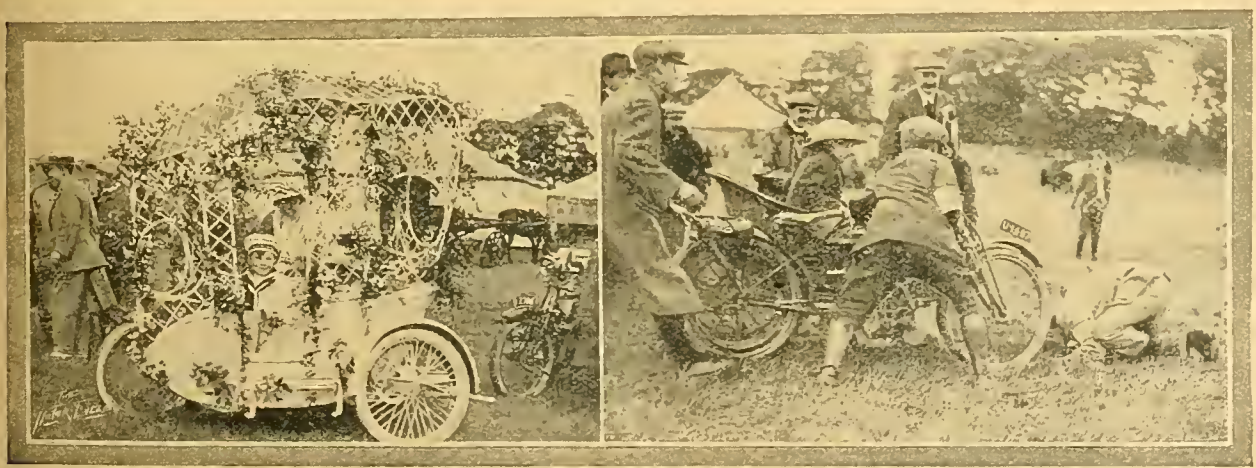
CLASS I. under 350 c.c.)—1, C. H. Jennison (2¾ Douglas; 2, Mrs. M. C. Jennison (2¾ Douglas).
CLASS II. (under 600 c.c.)—1, A. Hodgson (4¼ New Comet); 2, A. W. Grocock (3½ Zenith).
CLASS III. (under 1,000 c.c.)—1, B. Rhodes (8 Zenith); 2, L. W. Forinton (7 Indian).
CLASS IV. Sidecars.—1, B. Rhodes (8 Zenith); 2, S. Townend (9 Indian).

Deal, Walmer and District M.C.C.

A petrol consumption trial was held on the 25th inst. over a sixty-five miles course under real touring conditions. Official results:

	Weight m lb.	Miles per gall.	Ton Miles per gall.
1, K. Henshaw (4 B.S.A. Combination)	652 ..	129.3 ..	37.7
2, — Kirby (3½ B.S.A., with passenger)	588 ..	129 ..	33.9
3, R. Jewry (6 Sunbeam Combination)	776 ..	92.2 ..	32.0

The best consumption was 143.8 m.p.g. by Spicer (3 Enfield).



SCENES AT THE LEEDS M.C.C. GYMKHANA ON SATURDAY

(1) A beautifully decorated 4 h.p. Triumph sidecar owned by Mrs. A. T. Jenkins, who won a first prize.

(2) The Adam and Eve Race. A competitor endeavouring to pick up an apple from the ground with his mouth. The apples were originally to have been picked out of a tub of water.

Club News.—

Purley M.C.C.

W. H. Carson duly exhibited the hill-climbing capabilities of his "big single" Excelsior outfit to Purley club members on the 18th inst., and, accompanied by a crowd of members and visitors, went the round of some of the local test hills. The question was not whether he could get up them, but how many he could carry, and the load, including driver, was four on Soocombe Hill, Caterham, four on Chalkpit (an attempt with five up just failed on the top of the bend), and four on Crown Ash, whilst a stiff little bit of 1 in 3, just off Polsteeple, was twice successfully tackled with two up.

W. H. Carson (Excelsior sidecar) during his hill-climbing exploit with the Purley club.

Chipping Norton and District M.C.C.

A visit was paid to the Triumph factory on the 23rd inst., after which the club was entertained to tea by the company. A most instructive day was spent in going through the various shops.

Tunbridge Wells and District M.C.C.

Results of speed trials held on the 21st inst.:

		Time.		Formula.
1.	Carey (B.S.A.)	32⅜ secs.	....	1353
2.	L. C. Rumens (Douglas)	37⅕ secs.	....	1385
3.	Gardner (Douglas)	40⅝ secs.	....	1690
4.	Rawson (Rover)	37 secs	....	1701

The Motor Cycle formula was used.

Norfolk M.C. and L.C.C.

A 100 mile reliability run took place on the 16th inst., starting from Norwich at 1.30 p.m. on a circular route by Dereham, Fakenham, Wells, Cromer, Mundesley, and back to Norwich. There were three secret checks *en route*, besides checks at tea stop and finish. Results: 1, R. O. Clark (Singer light car), error 30 secs.; 2, A. Adcock (7-9 F.N. sc.), 4¼m.; 3, S. Rudd (2¾ Sunbeam), 4¾m.

The Cyclecar Club.

The winners on formula at the South Harting hill-climb, held on the 18th inst., are as follow:

Class II. Standard Touring Light Cars and Cycle Cars under 1,100 c.c.—1, W. R. Morris (10 Morris-Oxford), fig. of merit 1140; 2, L. Davies (10 Morris-Oxford), 1070.

Class IV. Lady Drivers of Standard Machines.—1, Miss Henry (8 G.W.K.), fig. of merit 695; 2, Mrs. Warren-Lambert (9.8 Warren-Lambert), 655.

Class V. Standard Touring Monocars.—1, W. E. Humphries (5 Carden), fig. of merit 1120; 2, J. V. Carden (5 Carden), 840.

The Team Prize was won by the G.N. team: A. G. F. Nash, H. R. Godfrey, and Dr. Colver-Glauert.

The positions on time, given last week, are confirmed with the exception that Miss Henry (8 G.W.K.) takes second place in Class IV.

FORTHCOMING OPEN EVENTS.

Race Meeting at Brooklands.

The Essex M.C. will hold an open and members' race meeting at Brooklands on August 15th, commencing at 2 p.m. The open events for motor cycles will be as follow: All comers' handicap, two laps; ditto, three laps; sidecar handicap, two laps; and for cycle cars; cycle car handicap, two laps. Motor cycles may be stripped, but must be efficiently silenced. Entries, which should be sent to Mr. E. J. Bass, Bishop's Stortford, close on August 5th

Bristol to Land's End and Back.

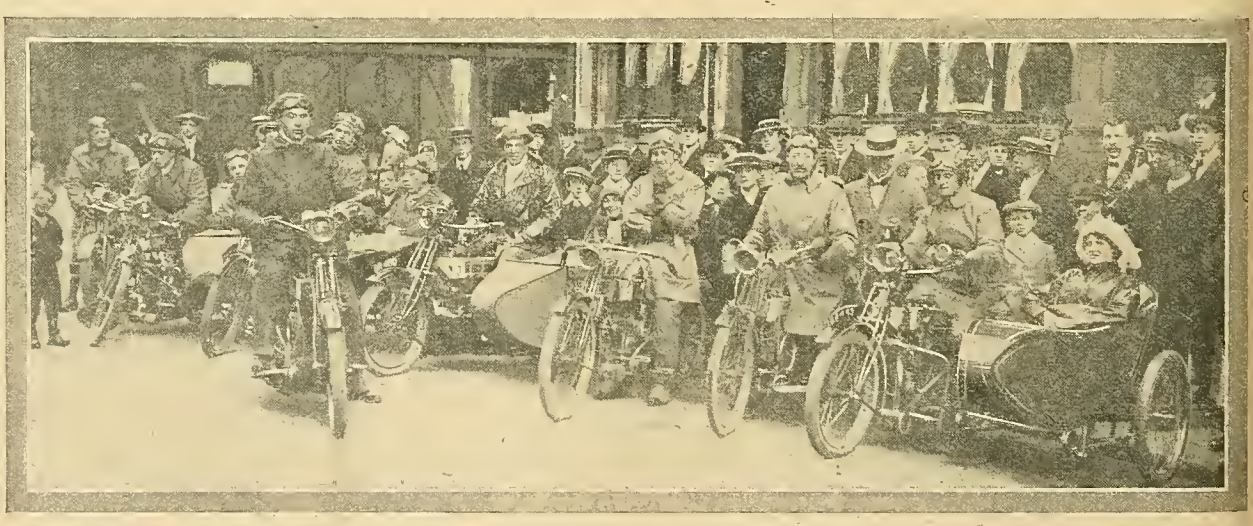
The Bristol Motor Cycle Club is applying for a permit to have a twenty-four hours run to Land's End and back on Friday and Saturday, September 4th and 5th, for motor bicycles, sidecars, and cycle cars. The route will be *viâ* Porlock, Lynton Hill, Barnstaple, Launceston, etc., and homewards *viâ* Dartmoor, Barnstaple, Beggars Roost, Hunters Inn, etc., etc., distance about 430 miles. All information from Rev. P. W. Bischoff, 17, Goldney Road, Clifton, Bristol.

SPEED TRIALS AT PORTMARNOCK.

The second race meeting of the season at Portmarnock under the auspices of the Dublin and District M.C.C. was held on Saturday last. The programme was made up of two open events, a ten-mile scratch race and a hundred miles handicap. The first-named resulted in a very easy win for C. B. Franklin, on a 3½ h.p. single-cylindered Indian. He was on scratch in the long distance race, but was in trouble before going very far and retired. The event went to J. Healy, on a 2¾ h.p. Enfield, who won comfortably by about four minutes, despite a petrol fire while replenishing. Results:

Ten Miles Scratch Race (under 500 c.c.).—1, C. B. Franklin (3½ Indian), time 13m.; 2, R. White (3½ Rudge), 14m. 4s; 3, W. A. Campbell (3½ Rudge), 14m. 15s.; 4, A. K. Wilhelmj (3½ Triumph), 14m. 25s.; 5, D. Harding (3½ Rudge), 15m. 30s.

One Hundred Miles Handicap (unlimited c.c.).—1, J. Healy (2¾ Enfield), 45 mins. start, time 2h. 51m. 50s.; 2, R. White (3½ Rudge), 20 mins. start, 2h. 30m. 40s.; 3, F. Holmes (3½ Rudge), 15 mins. start, 2h. 28m. 10s.; 4, A. K. Wilhelmj (3½ Triumph), 27 mins. start; 5, J. Clarke (3¾ Scott), 15 mins. start; 6. C. B. Franklin (3½ Indian) scratch.



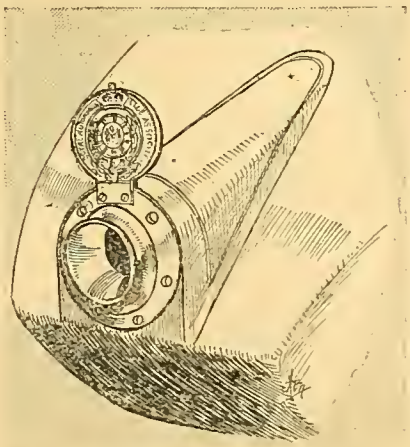
THE SUNDERLAND M.C.C. 200 MILE TRIAL.—Competitors leaving the luncheon stop at Doncaster on the homeward journey.

THE ANGLO-DUTCH TRIAL.

Third and Final Event of the Series for the N.M.V. Beker.

THIS year the Anglo-Dutch Trial will be held in Holland from September 6th to the 9th. The distance of the route will be 190 miles. There will be special prizes for Dutch and English private owners, and a prize for the best performance by English and Dutch trade riders. Those making a non-stop run will be awarded a large silver medal, and those who lose not more than twenty-five marks will receive a bronze medal. If more than one rider qualifies for a special award the prize will be granted to the rider who has adhered most closely to schedule time. The teams will consist of twenty English and twenty Dutch riders, ten of whom are private owners and ten trade riders, while all must be members of the F.I.C.M. or a body affiliated to it. The machines will be inspected at the Darracq Garage, 100, Stadhoudskade, Amsterdam, on September 6th, between 3.30 and 4.30 p.m. Circular number plates are to be fitted to the front wheels as in 1912 and 1913, the Dutch plate being orange and the English green, the numbers being in white. In addition, linen numbers must be carried on the back of the machine. Motor cycles must conform to touring conditions and must be fitted with horns, lamps, etc. Cut-outs are not allowed, and the exhaust must not discharge directly on the ground. The average speed will be between twenty-one and twenty-two miles per hour, while ten-mile limits must be observed. One mark per minute will be deducted for a competitor who is late or early of schedule time, but five minutes grace either way will be allowed. Any competitor making a compulsory stop will lose five marks. Checks close thirty minutes after schedule time of the latest man. Any competitor arriving after a check has been closed will lose forty marks.

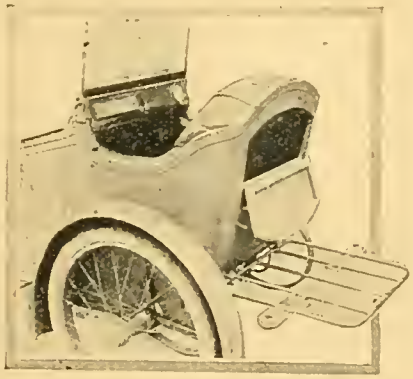
The question of the selection of the British team was gone into on Tuesday evening last week by the A.C.U. Competitions Committee, and an announcement was expected this week.



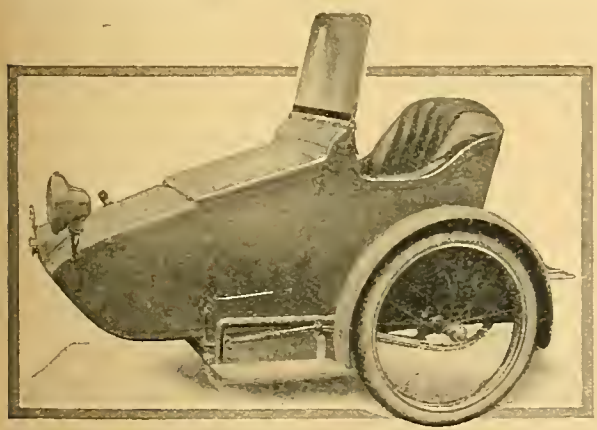
Position of mounting horn and R.A.C. badge on the front of the sidecar on the P. & M. described below.

A HANDSOME SIDECAR.

ONE of the most practical sidecars we have had the pleasure of inspecting was shown to us the other day at the premises of Messrs. Phelon and Moore, Ltd. It had been built to the order of Mr. B. Marians for his own use. The body is luxuriously upholstered, and at the back thereof is a spacious locker. The chassis is a Mills and Fulford, and a folding luggage grid is fitted behind. This is designed to take a Brooks travelling case, which is secured by a Brooks Instanta locking device. On the flap which goes over the passenger's knees are fitted shelves for goggles, maps, etc., a clock and a curved wind screen, while there is a further locker underneath the front portion which comes over the passenger's feet. A C.A.V. side lamp is fitted, and a Klaxon horn is neatly housed in the front of the body. Altogether it is a most luxurious and handsome affair, and is one of the best appointed sidecars we have yet seen.



The P. & M. sidecar, showing locker at the back and miniature "dash" with drawers and clock.



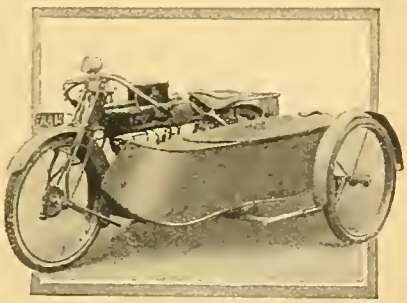
A handsome sidecar belonging to Mr. B. Marians, a director of Messrs. Phelon and Moore, Ltd.

PETROL ECONOMY.

In our report of the Midland Light Car Club's trial in the last issue, we mentioned the low consumption of the Morgan driven by V. Busby, but it now transpires that the winner of the President's Cup, Martin Anderson, on the Humberette, actually recorded the lowest consumption of the day. According to the official figures the petrol consumption was one gallon three pints for the ninety-two miles course, which equals a consumption of sixty-seven miles per gallon, or thirty-six ton miles to the gallon. These figures are certainly very remarkable for a 1,000 c.c. cycle car, and it may be mentioned that Anderson's Humberette was of the air-cooled type, and was fitted with a Smith four-jet carburetter, Harcourt radiators, and a Bowden extra air control.

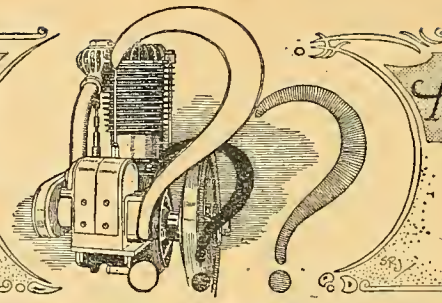
THE RALLY SIDECAR.

A SMART looking sidecar, which is extremely light withal, is the touring model Rally. The sporting model is now so well-known through its constant appearance in recent competitions, when it has more than once been driven to victory, that it needs no description. The touring model is on similar lines, but is more roomy and provides a more upright position for the passenger. The touring model retains the fine lines forward, and is extremely light, so much so that the manufacturers recommend it for use with quite light motor cycles. Whilst the body gives a low riding position there is ample ground clearance, and the excellent finish on the coach-built body may be carried out in any colour to suit customers' requirements. Prompt delivery can be obtained from the Rally Sidecar Company of Bradford Street, Birmingham.



A low-built Rally sidecar.

QUESTIONS AND REPLIES



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Long Run for a Lightweight.

Can you oblige me with the best route from Horsham to Aston, near Sheffield, and the approximate distance? My machine is a 2¼ h.p. two-stroke. Could it do the journey in one day? —A.R.

We advise you to proceed *viâ* Guildford, Chertsey, Egham, Windsor, Slough, Beaconsfield, Amersham, Tring, Dunstable, Fenny and Stony Stratford, Towcester, Weedon, Daventry, Hinckley, Castle Donington, Derby, Chesterfield, Staveley, Beighton, and Aston. Since the distance is approximately 200 miles it would mean a very long day's ride, and we should certainly not advise you to push the machine to its utmost limits for any length of time, as you would have to do if you attempted to do the journey quickly. It would be much better to break your journey halfway, say at Daventry or Hinckley.

Excessive Oil Consumption.

My 3½ h.p. single-cylinder uses more lubricating oil than I think it ought to. I have to give it about five pumpfuls in every ten miles, which seems to me exorbitant, and even then I never have any trouble with the plug sooting up, and no oil leaks from the crank case; the crank case gets pretty hot as well. Recently, while out riding, the engine began gradually to require more and more gas and less air, until finally it would only run with the gas full on and the air off. I thought the jet of the carburetter must be choked, but after dismantling I found that such was not the case. Can you suggest to me what is the trouble?—W.R.C.

The piston rings may be too tight and cause binding, or too slack and cause blow back. Why we draw this conclusion is because of your remark with regard to overheating, which seems to point to blowing back of the exhausted charge. The consumption is, of course, tremendous, and the reason why the plug does not soot up is probably because it is in such a position in the cylinder as not to be in the path of any oil which might be flying about. The engine should certainly be examined internally. With regard to your other question, it is somewhat difficult to give a correct answer. What we think, however, it might be is that the inlet pipe flange has become loose and caused a large air leak to take place.

Silencing a Big Engine.

I have a big twin with an inefficient silencer. The front cylinder is effectively silenced, but the rear one is not. Would a tail pipe be any use? I have about two foot length where I could put such a pipe. Would it be better if the end of the pipe were closed and the cover or the side of the pipe drilled?—C.C.H.

The additional length of exhaust pipe would effect a great deal of improvement with regard to the silence. If you find that the silence is not as it ought to be, try flattening up the pipe and drilling a number of fine holes, or making saw cuts in the pipe, when we think you will be quite satisfied with the result.

Interesting Valve Query.

Can you kindly explain these points to me? Why do motor cycles not have rotary or sleeve valves? Are not rotary valves more simple in operation than poppet or sleeve valves? What are the respective merits of the long and short stroke engines? Which is the more economical on petrol?—R.M.M.

The reason why rotary valves have not been fitted to motor cycle engines is due to the fact that lubrication is a very difficult problem for such a type on an air-cooled engine. Again, sleeve valves have been experimented with, but they are extremely heavy for the capacity of the engine; also lubrication is not easy to arrange satisfactorily. A rotary valve is an ideal arrangement if designed correctly, but it is extremely difficult to keep the compression, especially if the engine is somewhat small. It is certainly silent, and, of course, will not break, but you are always up against the trouble of its seizing up when used in an air-cooled engine. The advantage of a long stroke engine is larger radiating surface per cubic capacity, and probably rather greater flexibility. You also get, in theory at any rate, more expansion out of the charge. It is impossible to say which is the more economical on petrol; it really depends entirely on the state of the carburation. The relative advantages of long and short strokes are much discussed.

A Trip to France.

I intend taking my 2½ Levis with me to France shortly, and should be much obliged if you would give me some particulars about the Customs, licences required, etc. I intend riding to Paris and then to Tours. As I understand the roads near Paris are very bad, I thought of leaving my machine in some town or village west of Paris. Would you advise me as to the best route, and the most convenient place to leave my bicycle while visiting Paris?—J.L.

You should join either the Auto Cycle Union or the A.A. and M.U. Procure an international travelling pass, and they will hand you a Customs card which will see you through the Customs without difficulty. You should cross either from Newhaven to Dieppe or Southampton to Havre, and avoid riding into Paris as you would the plague, as the roads in the suburbs are practically impassable. Pontoise is the nearest town to Paris where we recommend you to leave your machine.

Loss of Power.

I have a 1¾ h.p. Quadrant. The trouble is no power. I have taken the engine down, and have found that part of a rim, which projects about $\frac{1}{16}$in. above the cylinder, and which fits into a recess in the cylinder head, has been worn away, and that most of the charge escapes through it. I have tried packing with brown paper soaked in linseed oil, but it blows out again. Can you help me?—S.H.

Apparently the trouble is excessive loss of compression through the cylinder head joint. This joint will probably have to be treated by an engineer, put in a lathe, trimmed down, and a good copper and asbestos washer fitted. A brown paper washer is no good in this place. If the piston is a perfect fit and new rings are fitted, and also the engine bearings are in good order, there is no reason why the machine should not go as well as ever after you have cured the trouble you refer to.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

Welding Cracked Cylinders.

I have just bought an old Bat motor cycle with M.M.C. (De Dion pattern) engine, and it is not running at all well. I find there are cracks in the exhaust valve seating. Would you recommend welding?—W.M.

Welding is quite satisfactory, but you would have to submit the cylinder to a welding expert before he could tell you if the repair could be carried out.

Blow Hole in Cylinder.

I have discovered a small blow hole in the valve pocket of the cylinder of my 3½ h.p. motor cycle. I shall be much obliged if you can tell me of a way in which I can repair same. Would it be better to bore a small hole and screw a bit of spoke in, or is there any iron cement made which would block it up to stand compression?—A.R.P.

There are iron cements, but, on the whole, we should advise you to bore a hole, thread it, and screw a plug tightly in with a copper washer under the head.

An Aid to Pedalling.

I have ridden an ordinary cycle for 34 years, but, although only 43, I find the hills rather trying, especially up and down in Plymouth as I go visiting my people. My mind wavers between an Auto-wheel and a lightweight. I weigh 13½ stones and stand 6ft. 3in. I feel that in and out of Plymouth streets I do not want a heavy motor cycle. I have been offered an old 3½ h.p. mount in very good condition for £18, but it has to be started with a run, and seems too big and heavy for street traffic. My work is mostly in town, though with an occasional run out, and I am not anxious for a machine that relieves me altogether from the pedal.—J.P.B.

As you wish to retain your pedals, we are inclined to advise an Auto-wheel. Pedals are almost unknown on motor cycles in these days.

READERS' REPLIES.

The Noises of a Two-stroke Engine.

Referring to letter from and reply to "Enquirer" in *The Motor Cycle* of July 9th, and to the fact that an engine makes a louder noise when approaching the hearer than it does when receding, I am not an engineer, but this is explained by the well-known "Doppler's Principle." When the engine is approaching, each wave of sound that leaves the engines has less distance to travel to the hearer than has the wave which preceded it, and this has the same effect as a shorter wave length, giving a higher note. When the engine passes the hearer, each wave has further to travel than the preceding one, and consequently the note falls. The best illustration of it is a railway engine whistle when a train is passing at full speed.—J.C.

In your issue of July 9th mention is made of the fact that the noise of a two-stroke engine is more apparent on the approach than on the departure, and the reply mentions the same thing in regard to other engines as well, but does not suggest an explanation. I think the explanation is simple. In the approach the ear receives a constantly increasing number of vibrations, whereas in the departure the vibrations as constantly decrease. Hence the change of pitch in the sound of a locomotive's whistle when an express rushes past—the pitch rising on the approach and falling on the departure.—AB 668.

I note that in your issue of the 9th inst. one of your correspondents remarks that the sound of a motor cycle engine is more noticeable when the machine is approaching than when it has gone by, and that you yourselves have been puzzled by the same phenomenon in the Gnome engine. I think the explanation of this difference lies in the fact that sound takes some appreciable time to travel, the velocity being known to be about 1,100 feet per second. Suppose an engine to be running "free." Each explosion will reach an observer at a certain definite interval after it has been made, according to his distance from the machine, but these intervals will all be the same, and he will hear the same number per second as if he were standing by the machine. Now imagine the clutch in and the machine moving rapidly towards him at the same engine speed. Each explosion will now reach him at a definite interval after it has been made, but these intervals will gradually diminish as the machine approaches and reduces the distance over which the sound has to travel, until they become zero when the machine reaches him, after which they will increase again. Thus, though the explosions all occur at intervals equal to the time of revolution of the engine (if a two-stroke), to the observer they will appear to occur at slightly smaller intervals, and the engine speed will appear to be greater than it is. Similarly, when the machine is receding, the engine speed will appear to be smaller. Taking an example. Suppose the engine running at 2,000 r.p.m., gear ratio 5 to 1, road speed approximately 30 m.p.h. It can be found by calculation that the engine revolutions will appear to be 2,080 when the machine is approaching and 1,920 when receding, which, I think, is quite sufficient to account for the observations made by you and your correspondent. —T.A.S.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"A.J.S." (Croydon).—Binks two or three-jet carburetter on 2¾ Levis. Easy starting, slow running, economy, and hill-climbing compared with Amac. Jet sizes.

"W.A.B." (Lee).—Single-geared Rudge. Wear of engine and reliability.

"D." (Northumberland).—Binks three-jet carburetter fitted to 7 h.p. Matchless or 8 h.p. J.A.P., comparing consumption and power with Amac carburetter.

"M.Q." (Rouen).—Side-slip with a Wall Auto Wheel.

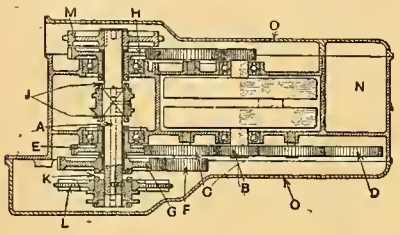
"M.W.B.S." (Bristol).—2¼ Baby Levis. Wear of belt; petrol consumption, capabilities of engine, general wear and tear, and ease of starting.

CYCLE CAR HILL-CLIMB AT SOUTH HARTING.

Nearing the summit in the class for racing machines. The driver is L. W. Spencer (8 h.p. Morgan).

Combined Engine and Speed Gear.

Behind the engine is arranged a counter-shaft A, which can receive power through three sets of gears, so that a three-speed gear is provided. On the engine crankshaft is a gear wheel, which meshes with the half-time gears C, of which the front one drives the magneto gear wheel D. The rear one drives a gear wheel E, which runs free on the counter-shaft. Alongside the rear half-time wheel is another gear F, which drives a gear wheel G free on the counter-shaft. On

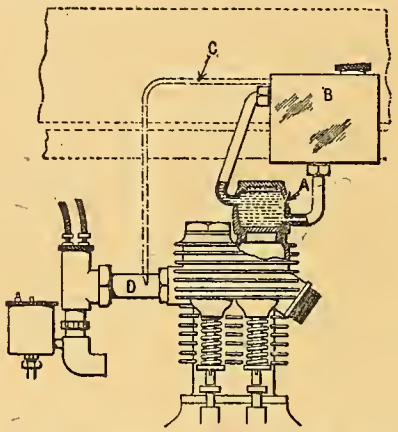


the opposite side is another gear wheel H, also free on the counter-shaft and driven from the crankshaft. By means of dog clutches at J and K any one of the gear wheels E, G, and H can be locked to the counter-shaft. Part of the kick starter is shown at L, and at M is a chain sprocket transmitting power to the rear wheels. The magneto is enclosed at N, and cover plates O are provided at each side to enclose all the gearing, which is lubricated by oil passing through apertures in the sides of the crank chamber.—A. E. Thomas, No. 12,617, 1913.

PATENTS, by Eric W. Walford

A Water-cooling Arrangement.

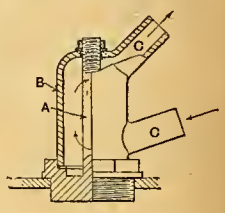
The exhaust valve cap is removed, and in its place is screwed the chamber A. This is connected by two pipes with a



water tank B. In this way the cap for the exhaust valve is water-cooled. By means of the tube C any steam forming in the tank is led into the induction pipe. —G. Lea, No. 13,966, 1913.

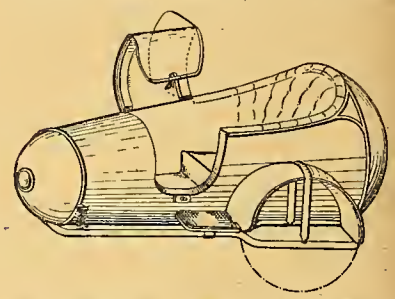
A Simple Water-cooling System.

The valve cap is provided with a central stud A, which clamps down on to the cap a chamber B formed with branches C. These branches are connected to a water tank or radiator, enabling the exhaust valve cap to be water-cooled. — W. W. Brown and A. W. Holland, 17,002, 1913.



A Sidecar Body.

Invention is claimed for the particular shape of this body, which is circular in cross section and tapers towards the front. The particular door and scuttle



arrangements will easily be understood from the illustration. In front of the door is a step, and to this is hinged the mudguard. Behind the seat is a receptacle for spares, etc.—J. Wathen, No. 5,514, 1913.

Consistent Wins.

At the recent M.C.C. Brooklands meeting M.A.G. engines gained no fewer than seventeen awards in various classes. Truly, a fine performance.

A Long List of Awards.

The successes of the Senspray carburetter during the month of June alone form an imposing list as long as the proverbial arm. Speed trials, hill-climbs, and reliability trials have all provided first awards to swell the numbers.

Three Speed Hubs.

A letter from H. G. Braybrooke, Port Elizabeth, S.A., speaks in the highest terms of the Armstrong three-speed hub. In the recent Rand-Durban race Mr. Braybrooke started forty-fourth and finished ninth, and his was the first hub-geared machine to finish.

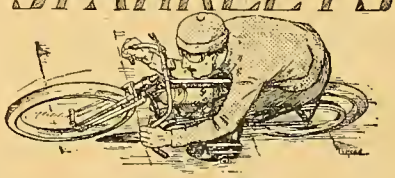
Avon Tyres.

Avon tyres put up an excellent record in the Six Days Trials. Three gold medals, the sidecar cup, and a bronze medal were won by machines using these covers. In the Colwyn Bay speed trials the same make secured five first places, six second, and four third.

Paris to the Hague.

We understand that Mynheer Emons, riding one of the new 7 h.p. four-cylinder F.N. motor cycles, has completed the journey between Paris and the Hague in 13h. 2m., thus securing a gold medal which was put up by *L'Auto Leven*, which was offered to any motor cyclist breaking the record of 13h. 18m.

SPARKLETS



Tyres and Trials.

Hutchinson tyre users scored in the strenuous A.C.U. Six Days Trials. Ten medals, seven gold, two silver, and one bronze, also the team prize, fell to riders of these tyres.

A Speedometer Refinement.

In a recent issue in which we published the description of the Stewart speedometer, we mentioned that the flexible shaft was covered in leather. This is not the case, the covering being of rubber, which is better suited to the exclusion of moisture from this delicate part of the mechanism.

Rims and Tyres.

The 2 h.p. O.K. which performed so well in the A.C.U. Six Days Trials, in the hands of N. Hall, was fitted with Roman rims, a fitting which is bound to be of great service over such rough surfaces, owing to the fact that they will not break and do not dent easily.

In the same eventful trials, Palmer tyre users were awarded six gold medals and one bronze.

The Ariel Abroad.

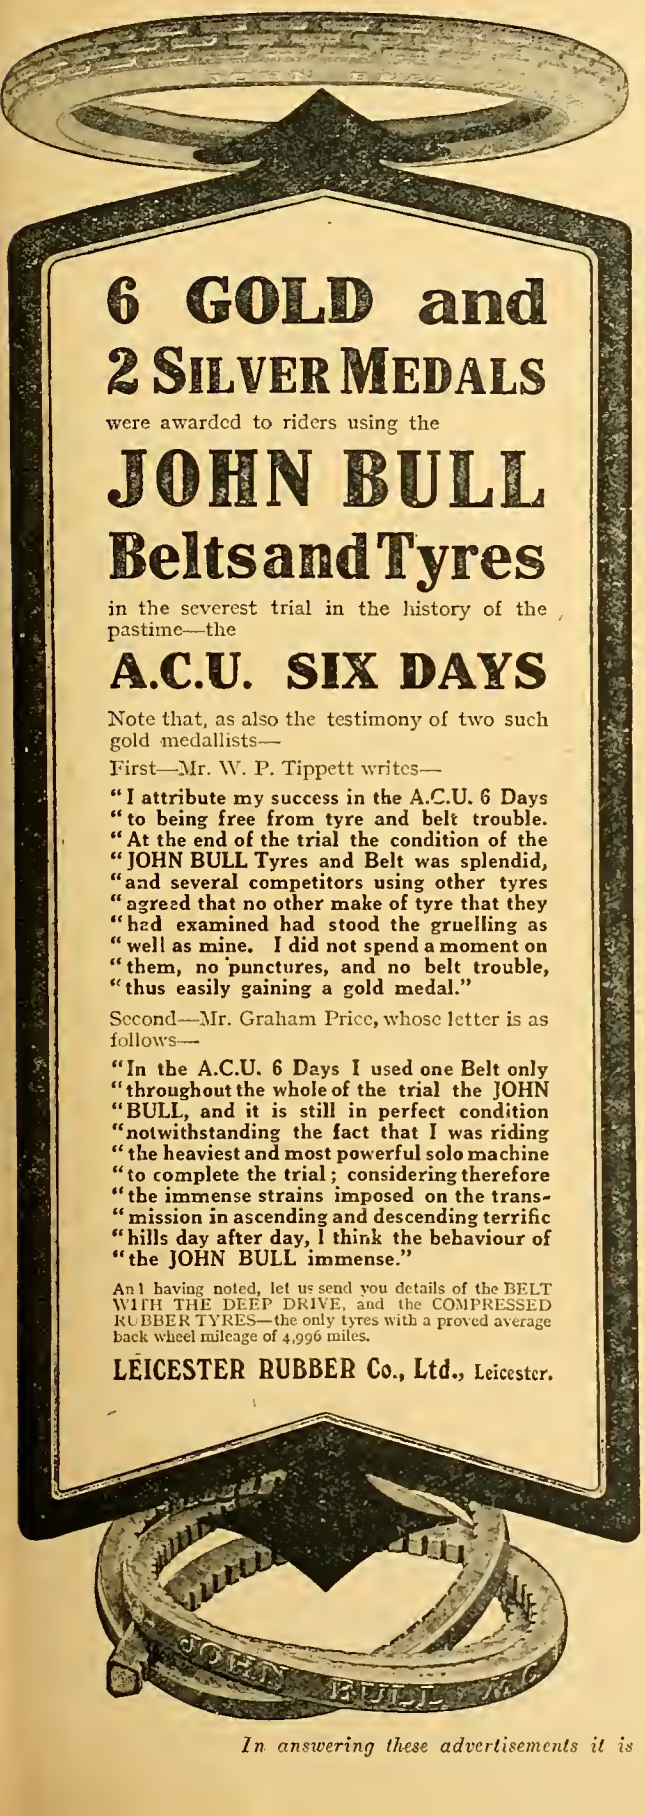
We have received an appreciation of the excellent performances of the 3½ Ariel in the Colonies. Mr. R. W. McClure, who lives in the western part of New South Wales, writes that he has ridden all models from 1909 to 1914 inclusive, and his testimony of their performances over the rough cart tracks and bumpy roads is a good proof of the excellence of manufacture.

Royal Ruby Successes.

An 8 h.p. Royal Ruby and sidecar, piloted by J. Ellis Walker, is making a reputation for itself in Yorkshire. In the Bradford Club's handicap hill-climb it obtained a first award, and in the speed trials held by the same club, besides winning the sidecar event, it was awarded a special gold medal for making fastest time of the day, its speed being only just under 60 m.p.h.

Economy of Efficient Radiators.

A point which is not generally recognised in connection with cool running engines is their economy in oil consumption. This is one of the claims put forward by the inventor of the Harcourt radiator, which fitting is, incidentally, being extensively adopted. During the A.C.U. Six Days Trials C. O. Henfrey ran out of oil on his 3½ h.p. Ariel, and was obliged to cover the remaining seventy miles without any lubricant. He considers that this would have been impossible without Harcourt radiators, but by their aid he was actually successful in covering the distance stated.



6 GOLD and 2 SILVER MEDALS

were awarded to riders using the

JOHN BULL Belts and Tyres

in the severest trial in the history of the pastime—the

A.C.U. SIX DAYS

Note that, as also the testimony of two such gold medallists—

First—Mr. W. P. Tippett writes—

"I attribute my success in the A.C.U. 6 Days "to being free from tyre and belt trouble. "At the end of the trial the condition of the "JOHN BULL Tyres and Belt was splendid, "and several competitors using other tyres "agreed that no other make of tyre that they "had examined had stood the gruelling as "well as mine. I did not spend a moment on "them, no punctures, and no belt trouble, "thus easily gaining a gold medal."

Second—Mr. Graham Price, whose letter is as follows—

"In the A.C.U. 6 Days I used one Belt only "throughout the whole of the trial the JOHN "BULL, and it is still in perfect condition "notwithstanding the fact that I was riding "the heaviest and most powerful solo machine "to complete the trial; considering therefore "the immense strains imposed on the trans- "mission in ascending and descending terrific "hills day after day, I think the behaviour of "the JOHN BULL immense."

And having noted, let us send you details of the BELT WITH THE DEEP DRIVE, and the COMPRESSED RUBBER TYRES—the only tyres with a proved average back wheel mileage of 4,996 miles.

LEICESTER RUBBER Co., Ltd., Leicester.

♦ the oil that lubricates most ♦

The correct way to test oil.

Chemical or physical tests of oil are often misleading.

Two oils of the same gravity or weight differ in efficiency, and two oils of the same flash point may be entirely unlike in action.

Oils from widely different bases may be given the same body or viscosity.

Therefore, gravity, flash point and viscosity are not safe guides to the quality or durability of oil.

The only real tests of lubricating oil are practical tests.

In sheer lubricating qualities Gargoyle Mobiloils stand alone.

More power and less carbon troubles are assured by using Gargoyle Mobiloils.

WRITE TO-DAY.

Send us particulars of your car and we will tell you the correct grade of oil for ideal lubrication. Booklet free.

Goodyear "Blue Streak" outsells any other Tyre

Motor cyclists bought 120,000 Goodyear motor cycle tyres in 1913. No other motor cycle tyre in the world has such a sale, and the demand is growing daily.

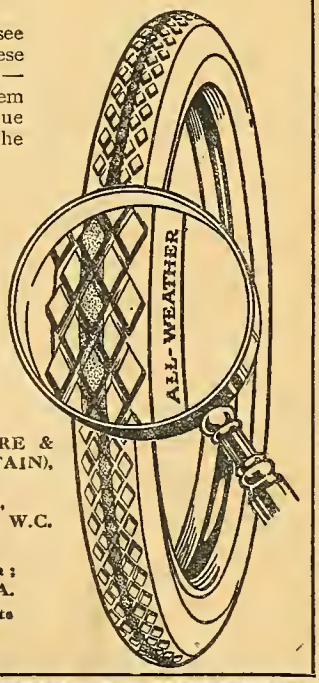
The secret of Blue Streak success is in the "All-Weather" Tread of double thick diamond rubber studs, which roll as smoothly as a smooth tyre in dry weather, and grip the road with a bull-dog grip in wet weather. And throughout the Blue Streak is built just like the famous Goodyear Motor Tyre.

In December last Mr. Lee Humiston covered two miles in 36 seconds, or at the rate of 100 miles per hour, on

GOODYEAR

Blue Streak tyres—a world's record!

You should see and examine these wonderful tyres—you will know them by the dark blue band down the middle.



Any good tyre dealer will show them to you.

'MILLENNIUM' TOOLS

SAVE TIME AND EXPENSE.

To the motor cyclist who desires to get the most out of his machine, both in efficiency and life, and yet spend the minimum amount of time and expense on repairs and adjustments, "Millennium" Tools are indispensable. Made by a practical firm who understand thoroughly the requirements of the motor cyclist, there is a "Millennium" to suit every "job," and, what is equally important, to enable that "job" to be done with the utmost speed and efficiency.
The "Millennium" Illustrated Price List gives full particulars. Send for YOUR copy TO DAY—you never know when you may want it.

'MILLENNIUM' UNIVERSAL VALVE TRUER.

For truing seatings on the heads of motor valves. Does the work as well as a lathe, and in less time. PRICE - - - **7/6**

'MILLENNIUM' PARALLEL VALVE SPRING LIFTER.

Does not bend the valve stem. Easy to use. Made of best steel stampings. PRICE - - **4/9**

'MILLENNIUM' MAGNETO TIMING WHEEL PULLER.

For keeping the engine properly tuned. This tool is exceedingly handy to use and can be worked in very confined spaces. PRICE **5/6**

'MILLENNIUM' MOTOR CYCLE PULLEY DRAWER.

Enables the pulleys of Motor Bicycles to be removed without damaging the motors. Fits practically all pulleys from 3-6 in. diameter PRICE - **8/-**

THE E. S. MYERS BRADFORD

"MYERS" SIDECAR

(SCOTT'S PATENT)

is made especially for the SCOTT machine, and the two combined make an ideal combination, giving complete immunity from vibration and road shocks.

The **"MYERS" SIDECAR** is the only one that is scientifically correct. Not a bent tube, and every one either in compression or tension.

One of the many testimonials from riders of Juno Motor Cycles.

SILVER MEDAL AWARDED.

W. S. Capstick, Esq., 630, Manchester Road, Bradford, writes: 22nd July, 1914.

"I have been awarded a Silver Medal in the Bradford M.C.C. Speed Trial, on Blubberhouse Moor, Harrogate (Handicap) with JUNO 2-STROKE, with a speed of just over 38 miles per hour. The machine will really do more. I have got 49 out it several times."

1912	3½	**HUMBER,** 2-speed, lamp, and generator	£32
1912	6	**BAT-J.A.P.,** Lucas lamp set	£32
1914	8	**MATCHLESS,** M.A.G. engine, 3-speed, Swan Sidecar, hood, screen, 3 lamp sets, horn, speedometer, spares, etc	£80
1914	2½	**T.D.C.,** nearly new	£20
1909	2¾	**MINERVA,** lamp, generator, and horn	£10
1911	2¾	**ROYAL ENFIELD,** lightweight	£18
1913	2¾	**ROYAL ENFIELD,** 2-speed, kick starter	£33
1913	3	**ROYAL ENFIELD,** 2-speed model	£37
1911	6	**ZENITH,** Gradua gear, speedometer, F.R.S. lamp set, rear lamp, tools, and spares, fitted with CANOE MILLFORD SIDECAR	£44
1912	3½	**ZENITH,** Gradua gear	£30
1912	3½	**ZENITH,** Gradua gear	£32
1913	6	**ZENITH,** clutch model with Gradua gear and kick starter, speedometer, F.R.S. lamp set, horn, and MILLFORD EMPRESS SIDECAR	£68
1913	10	**TURNER** LIGHT CAR, 4-cyl. (list price £185). Extras: Hood, screen, head lamps, tail lamp, horn, tools, etc.	£95
1913	8	**ROLLO** CYCLE CAR, Jap engine, Bosch magneto, hood, screen, speedometer, head lamp, side and tail lamps, horn, etc.	£58
1913	8	**HUMBERETTE,** hood, screen, lamps, horn, speedometer, Stepney wheel, and tyre	£80
1909	8	**BABY PEUGEOT** LIGHT CAR, 2-seater body with wind screen, 3-speed gear, and reverse, magneto ignition	£30

MOTOR CYCLES FOR SALE.

Scott.

SCOTTS, delivery from stock; cash, exchanges, or deferred payments from the Birmingham and Manchester agents, Colmore Depot, Birmingham and Manchester. [X6445

SCOTT, 1913, fitted with 1914 engine, just been overhauled, in absolute perfect condition, original tyres fitted with studs quite visible, mileage of this machine does not exceed 600 miles; this lot, complete with smart sidecar, for £54; an absolute genuine lot.—Colmore Depot, 31, Colmore Row, Birmingham. [X6429

Singer.

SINGER Lightweight, 1914 model, shop-soiled only; £36.—Raleigh Cycle Co., Ryde. [X6488

SINGER, 1913, 2½h.p. fixed engine model, excellent condition, lamp, horn; £23.—Layton's, Bicester, Oxon. [X6618

SINGER, 1913, 4½h.p. free engine, coachbuilt, Ivy sidecar, perfect condition; £40 cash.—Brown, 6, Dunstable Rd., Luton. [5686

SINGER, 2¾h.p., 1912¾, very little used, lamp, horn, etc., Hutchinsons, splendid condition, owner abroad, £18.—Eldridge, Fordingbridge. [5887

SINGER, 1913, 3½h.p., free engine, accessories, splendid condition throughout; £32.—Robinson, Winthorpe, Warminster Rd., Norton, Sheffield. [5818

1912 3½h.p. Free Engine Singer, as new, P. and H. lamp, horn, etc., enamel, plate, and tyres excellent; £28.—Booker, New Farmhouse, Epping. [5781

BRAND New 1913 Singer, 3½h.p., Sturmey-Archer 3-speed and free engine; usual price £58/10, take £48/10 spot cash.—Taylor, Motor Agent, Kettering. [X5471

1912 3½h.p. Singer, just thoroughly overhauled, rebushed, etc., semi-T.T. bars, Palmer and Rom tyres, excellent condition throughout; £25/10.—Parker and Son, St. Ives, Hunts. [0514

Sparkbrook.

6h.p. 2-speed Sparkbrook Sidecar Combination, slightly shop-soiled; £82; immediate delivery.—The Glendower Motor Co., Ltd., 3, Glendower Place, South Kensington. [5892

Stevens.

4½h.p. w.c. Stevens Engine, Claudel carburetter, 1913, mag., and sidecar; accept £18, or offer.—How, High St., Epsom. [X6294

Sun-Villiers.

SUN-VILLIERS 2½h.p. 2-stroke Motor Cycles; the perfect lightweight; price 25 gns.; immediate delivery; easy payments.—Cooke's, Longsight, Manchester. [X6557

Sunbeam.

SUNBEAM, 6h.p., in stock.—Chilton, High St., Watford. [X6563

3½h.p. Sunbeam, just delivered, 66 gns.; sidecar, 15 gns.—Dosser, Slingsby, Malton. [X6523

SUNBEAM, 1913, 2¾h.p., 2-speed, very good condition; £40.—Seal and Ball, Southport. [X6582

1914 2¾h.p. Sunbeam, new, in stock for immediate delivery; price 55 gns.—A. E. Gollin, The Motor House, London Rd., Grantham. [5961

SUNBEAM, 6h.p., Speedwell sidecar, hood, screen, etc., spares, only done 1,000, first cheque for £80; full particulars.—Uhique, Harlington, Milford-on-Sea, Hants. [5796

SUNBEAM, 1913, 6h.p., just overhauled, with Canocelet sidecar, screen, hood, and curtains, 2 head lamps, and rear light, Smith speedometer; cost £110, will accept £75, or will take Lewis or similar in part exchange.—Wilks, Builder, Shrewsbury. [X6450

6h.p. 1914 Sunbeam, with special Gloria coachbuilt sidecar, as supplied with Sunbeam combination, Lucas head lamp and generator, Lucas horn, Watford speedometer, cover-all apron for sidecar, only done 2,500 miles, all in perfect condition; bargain at £85, cost £120; reason for sale, owner giving up.—To be seen at Steel's Garage, Cheltenham. [X6049

T.D.C.

T.D.C., 3½-4h.p., 1913, F.E., 3-speed, lamp, horn, etc., good running order, splendid worker, with sidecar; £35, lowest, or would exchange for lightweight and cash.—P. A. Duckett, Sulham Lodge, Pangbourne, Berks. [5733

Torpedo.

TORPEDO Precision, 3½h.p., 1914, only ridden once; £25; also 1913, in good order, £20.—Percy Suckling, Linton, Cambs. [X6599

Triumph.

1911-12 Triumph, guaranteed, from £24.—Young, Newmarket. [5099

TRIUMPHS.—Premier Motor Co., Aston Rd., Birmingham. [0559

1914 2-stroke Triumph in stock; £42.—Guy-Reynolds, Weymouth. [X6665

1912 F.E. Triumph and Sidecar; 32 gns.—Julian, 84, Broad St., Reading. [X6389

1913 Free Engine Triumph; price 33 gns.—Julian, 84, Broad St., Reading. [X6384

1914 4h.p. Triumph, 3-speed gear; £60.—Parker and Son, St. Ives, Hunts. [0534

TRIUMPH, clutch, N.S.U., 2-speed, and sidecar; £35.—47, Drayton Park, Highbury. [5721

The Fascination of Dynamo Lighting.

UNLESS we are very much mistaken, the motor cycle will next year follow in the steps of its bigger brother the motor car, in that the dynamo lighting set will be part of its equipment. Of course, we have had dynamo lighting sets with us for some time, but they have been confined to one or two makes of machines. In the near future, however, we opine that the use of electric lighting will be considerably extended. This movement has not suddenly come about; it has arrived very gradually, as we suggested might possibly take place at the time of reviewing the last Olympia Show. Acetylene lamp makers must look to their laurels or fall in line with popular demands. We do not suggest by this that the acetylene lamp will be displaced in the near future, because we realise that the low cost and other advantages possessed by the acetylene lamp must cause it to be some considerable time before it is ousted from public favour. The beauty of electric light, of course, is that there is an entire absence of flicker, and one has an illuminant which can be turned off and on at will without stopping or getting out of the saddle. It is, however, best to do this while travelling on a smooth piece of road at a moderate pace, because the filament is rather brittle at the moment of becoming hot, and a violent jerk might break it.

Again, one must pay fairly frequent attention to acetylene lamps in refilling the carbide and water chambers, and also in keeping the generator scrupulously clean to ensure the best results when it is desired to use the lamp; but no such objections attach to the electric lamp. The worst that can be said concerning the electrical set is that the lamp filaments are apt to break, and should any portion of the mechanism fail the whole of one's illuminant has gone as soon as the accumulators are exhausted. Motor cyclists and sidecarists will not return to accumulator sets without some misgivings, but the troubles which were associated with wet batteries in the olden days have practically disappeared, the dynamo automatically keeping the batteries up in their best condition and to the required voltage without the annoying trouble of removing the batteries for recharging purposes. Again with the electrical set, the lamps can be formed of a much better shape, and especially does this advantage count when cleaning time comes along.

The Practical Side of the Question.

AN article in last week's issue suggests the possibility of combining the magneto and the dynamo to one compact unit for ignition and lighting. This idea is not exactly new, but at the time the article was penned we were not aware that experiments were proceeding in connection with an instrument for motor cycles which would perform the dual functions. Since the article was written, however, a rumour has reached our ears to the effect that a well-known magneto company is busy perfecting a neat and compact instrument in which the dynamo is embedded within the magnets of an ordinary magneto machine, so that the dual work of ignition and lighting will be possible with the one instrument. It has been patent for some considerable time that electric lighting must come into its own for use on all motor vehicles, but such rapid developments have taken place in the production of car lighting installations that motor cycle accessory manufacturers have quickly followed suit, with the result that, as we have already foreshadowed, the Olympia Show of 1915 models promises to be chiefly notable for the progress of electric lighting on motor cycles, and particularly on sidecar outfits. Already there is more than one neat lighting set on the road, and we shall not be surprised to find a few firms turning out *modèles de luxe* with dynamo lighting as a standard part of the equipment.

THE 1914 OLYMPIA SHOW.

AN effort towards a scheme of uniform stand decoration with a view to such being adopted for 1915 will be one of the features of the 1914 Show. To this end certain stands on the ground floor will be set apart for the erection of specimen stands, and will be completely fitted with stand fittings, sign and name boards, floor covering, electric fittings, and a certain number of these will be available for firms desirous of availing themselves of such types of stand. Many readers will recollect that at the last Paris Salon a scheme of uniform stand decoration was adopted with excellent results, both from an artistic and utilitarian standpoint, and there is little doubt that it is only a question of time before the same principle is applied to Olympia.

Cycle Cars in the Annexe.

At the forthcoming motor cycle show this year the Annexe, other than stands backing on to the wall, will be exclusively reserved for light cars and cycle cars, and in this connection it is interesting to note that the Cycle and Motor Cycle Manufacturers and Traders Union, Ltd., define a light car as meaning any two-seated automobile, the retail price of which equipped for the road, including hood, wind screen, lamps, and spare wheel, does not exceed £200, while for cycle cars the cylinder capacity must not exceed 1,100 c.c., and the weight of the chassis must not exceed 6 cwt. The chassis shall include tanks, radiators, bonnet, and tyres. The Management Committee reserve the right to exclude from the Show light cars within the above definition, but having larger engines fitted.

Convenient for Visitors.

This grouping together in the Annexe of the four-wheeled exhibits is undoubtedly a move in the right direction, as visitors will not then have to dodge about from stand to stand all over the Show in search for cycle cars or light cars.

An excellent new feature of the management is the placing of the offices of the different firms over the stands on the ground floor backing on to the wall. Approaches to these offices will be by stairs arranged at convenient distances. This scheme will release a large amount of space on the ground floor for exhibits.

This year's Motor Cycle Show is the fifth of the series, and will be held from the 23rd to 28th November inclusive.

WHAT TO WEAR.

Some Hints to Novices.

THE first trip on the new machine suffices to inform the novice that motor cycling requires a special garb; but the first season by no means educates a rider as to the final ideals in respect of raiment.

The fair-weather potterer, who never rides in bad weather unless a sudden storm takes him by surprise, may rest content with a cheap set of waterproofs. The coat should be a buttoned type, not a neck-hole pullover; for the latter is inconvenient to put on, though it affords better protection from rain. The leggings should have good straps to pass under the sole of the boot—the ordinary thin straps fail to survive the first wet day. Seatless leggings are miserable if a tyre repair, or any other emergency demanding a sitting posture on a wet bank or road, comes along; but the seated patterns are seldom decently ventilated, and are often as uncomfortable as they are unhealthy. Personally, I wear the seatless type for the sake of comfort, and when I have to squat on wet mud, I am careful to use an improvised mat—perhaps my oilies, or a large stone from the roadside. The overalls should *not* be thick. They serve a double purpose in that most riders employ them as anti-dust clothing on hot summer days. If they are light and thin, they will serve both functions admirably; if they are heavy and close-woven, they will be intolerable in August. Footwear matters little in these days of kick-starters and free engines, though the owner of a T.T. single-geared machine should wear rubber-studded golf shoes. In any case, the boots should be of the best quality, for when the roads are awash with surface water, an ordinary walking boot will be spoilt, and will further cause its wearer acute misery. In cold weather, a thick sleeved vest or leather under-jacket may be worn to atone for the lightness of the overalls.

The serious tourist and the competition rider will obviously require some additions to the above wardrobe. Some men purchase extremely heavy proofed fabrics as a protection against storms. This is a gross blunder. They are so bulky that they cannot easily be packed away on the carrier; they are most uncomfortable on scorching summer days, and they are not truly efficient in prolonged heavy rain. The basis of the strenuous rider's kit should be similar to that of the potterer, but it should be supplemented by a suit of first-class oilskins. There is nothing to touch them for real bad-weather wear.

Headgear and Gloves.

Every motor cyclist should either wear or carry a more or less waterproof head gear. No matter how dry and warm the body may be, the rainy ride is intolerable if a sodden cap is dripping streamlets down one's neck and over one's face. The man who wants to wear a smart and rakish tweed cap in dry weather may do so; but he should store a storm cap in his pocket. The son'-wester is by no means ideal for the purpose, as the wind gets under its tail-flap, and makes it lift off the head at any speed, when the elastic chin strap makes its presence and narrow edge unduly felt. Failing a waterproof fabric cap, I recommend the oilskin storm helmets, with a hole for the face, and a curtain down the back of the head joining a piece which comes round in front under the chin. These little used helmets appeal to me as the best head-wear for bad weather.

Gloves are still an unsolved problem. Leather and fur are very nice in good weather, and if of good quality will keep out ordinary rain for an hour or two. In a soaker they are wretched things, and are generally unusable the next day, while cheap patterns never recover from a drenching. ROAD RIDER.

OCCASIONAL COMMENTS

BY IXION

Bravo, Rudge!

I must ask the Rudge Co.'s pardon for my ignorance of the fact that they had standardised a slip-on speedometer fitting which requires no tinkering to get the gears in perfectly accurate mesh. It is high time that other large firms followed such an excellent lead. Riders who have never tackled the job will understand its intricacy if I report that a leading speedometer firm charged me *ten shillings* for fitting a three guinea speedometer last week. I expected they would do it for nothing, and desired to avoid a fiddlesome hour on my garage floor, but as my time is scarcely worth 10s. per hour, I shall do it myself next time. We live and learn.

Repair Platforms.

I am glad to see that Messrs. Brown Bros. and one or two other firms are advertising light wooden repair platforms at modest prices. Any motor cyclist who is an amateur carpenter in a small way may prefer to construct such a platform for himself, but there is no question that the accessory is one of the most useful. The awful backaches usually sustained in the prolonged stooping inseparable from repairs and adjustments tackled with the machine on the floor are a thing of the past. If agents up and down the country will place machines on these platforms in their showrooms and windows, the sales will be large.

A Motor Cycle Rolls-Royce.

Of late years very little of my road work has been accomplished on high-powered machines, because a variably-geared 3½ h.p. does all one needs in solo work, and my passenger work is mostly done on an up-to-date cycle car or light car. However, I have lately been sampling two or three 750-1,000 c.c. mounts, and I have specially fallen in love with a 5-6 h.p. Ariel which I have had the temerity to ride solo. The makers say that it weighs 280 lb. only, but it seems as lumbersome to handle as the 7 h.p. Indian, which scales 3 cwt. with the lighting outfit. This is its sole drawback. I pant and perspire as I wheel it out of its shed, but when I get it on the road it is a perfect dream. It starts as easily as my wee Douglas, its gears snick home like a knife separating a butter-pat, its brakes combine the grip of Samson with the velvetiness of Delilah, its acceleration is terrific, and its top gear suffices for all main road hills. Still, these are not the features which have specially won my heart. It knocks the ordinary 3½ h.p. mount silly at moderate touring speeds. At 20 m.p.h., for instance, the machine is dead silent and literally vibrationless. You cannot hear the engine exhaust or valves; the big tyres, spring forks, sprung saddle holder, and great weight absolutely damp out all the inequalities of the road surface, and make it more comfortable and steady over indifferent roads than any £500 car, and there is not the most minute semblance of engine convulsion. The driver drifts along as if he were wafted on a cloud, travelling a few inches above the road surface. It is the last luxury in locomotion. If the throttle is opened up to 30 or 35 m.p.h. you just grow conscious that the road contains pot-holes and that you are sitting over an engine which is discharging burnt gases astern as unostentatiously as possible, but that is all. These merits are, of course, shared with other machines of equal class; the latest M.A.G.-engined Matchless is a worthy mate for an Ariel, for instance. But as I know the Ariel best I use it for a text.

Others, Please Copy!

This experience of mine suggests that there will always be room for the heavy high-powered outfit. No 3½ h.p. machine that I have ridden even distantly approaches the smooth mastery of this big twin, and it is folly to pretend that the 3½ h.p. is perfect until it at least faintly mirrors this supreme comfort. Descending to lighter machines, the inherent inferiorities of the type are manifest. 100 lb., and even 200 lb., have manifest merits in comparison with 300 lb.; they are easier to wheel about, cheaper to buy, cheaper to run; but they cannot combine this tremendous substantiality with perfect silkiness of

Miss McMally, one of the latest recruits to motor cycling, with her three-speed Triumph sidecar. In spite of having only ridden for a few weeks, this lady has quickly mastered the control and handling of her machine.

Occasional Comments.—

running and profound mastery of their work. The manufacturer of a successful 3½ h.p., 2¾ h.p., or 2 h.p. would be well advised to ride the best big twin he can buy, and try to transfer its special merits to his own lighter wares. If I were engaged in the design and manufacture of baby two-strokes I would drive a 7 h.p. 10,000 miles per annum, so that my ideals might not sink too low.

Delivery Tune.

I suppose I shall have to turn my attention to the delivery tune of cycle cars next. A friend of mine took over a chassis this week and found:

All the valve caps leaking freely.

The joint between crank case and cylinders spitting oil liberally.

The inner tubes minus even a speck of French chalk.

The wheel rims unpainted and rusted internally.

The detachable wheels stuck to their hubs with paint, through being bolted in place too soon.

The oil indicator float of the engine sump punctured.

The petrol consumption working out at 24 m.p.g. (instead of the normal 35 m.p.g.)

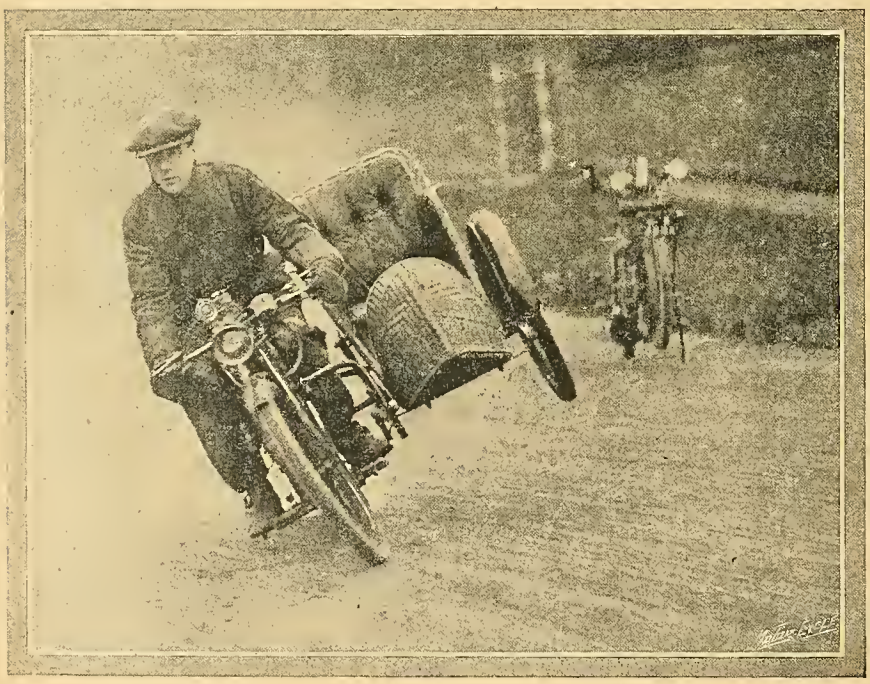
Vital Fractures.

Some of my recent correspondence indicates a very real danger in connection with the growing popularity of lighter machines and sidecars. Visiting a garage with my cycle car the other day, I saw a medium-weight motor cycle and sidecar, both a fortnight old, and of the high-priced variety, reduced to a tangled mass of twisted tubing by the snapping of a spring fork link. The next morning brought me a letter reporting the breakage of five medium-weight frames in a single small Irish town since last autumn. The next afternoon I saw a rider of a medium-weight take a header over his handle-bar owing to frame breakage. These incidents naturally set me thinking. Two factors emerge quite obviously:

1. Many makers of light machines are guessing at the nature of frame and fork stresses, and of the size of tubing required to provide a large safety margin.

2. Many rash riders are fitting sidecars to machines which are designed exclusively for solo work.

Two reforms are plainly essential. The first is that every frame and fork should be designed with a safety margin wide enough to include the strains of sidecar work, which implies that a frame should be at least 100% stronger than solo work demands. The second is that manufacturers who embark in the light and medium-weight departments of manufacturing should engage a technical expert to work out with scientific accuracy and certainty the sizes of tubing required for all the frame details, not excluding the side links of the spring forks. We have been through all this trouble more than once before. About the year 1903 several very promising men were killed by the collapse of utterly inadequate steering forks; and such a casualty list would reach very large dimensions now that the number of riders is so enormous. Then again, about 1906, when the lightweight movement received a fresh impetus, broken frames and forks were immensely common; in one six days trial the entire team of a first-class manufacturer were outed with trouble of this character. To-day, the medium-weight is being manufactured by the thousand, and many users are fitting quite luxurious sidecars, while the tiny two and four-stroke engines are rapidly breeding another new species of motor bicycle. There is every sign that haphazard makers and assemblers are glibly saying to their works managers, "We shan't want such heavy frames or forks as the 3½ h.p.—cut down all tube sizes by so and so!" Hence the casualty list is growing. As a matter of fact, a 180 lb. machine, fitted with a 350 c.c. engine, is capable of at least 45 m.p.h. solo, and as it sits lightly on the road, it is subject to more vibration and swifter crystallisation than the more stable 500 c.c. engine. The same reasoning applies *a fortiori* to the miniature machines. There are too many flimsy frames and forks about; and there are far too many sidecars fitted to machines which are quite incapable of withstanding any additional strains.



JUGGLING WITH A SIDECAR.

S. A. Buttearn, of the Cambridgeshire M.C.C., amusing himself on his 2¾ h.p. Douglas and sidecar by riding in complete circles in the road with his sidecar wheel in mid-air. The practice of trick riding with a sidecar seems to be spreading, but it is neither good for the machine nor the sidecar connections, and a slight miscalculation might cause disaster.

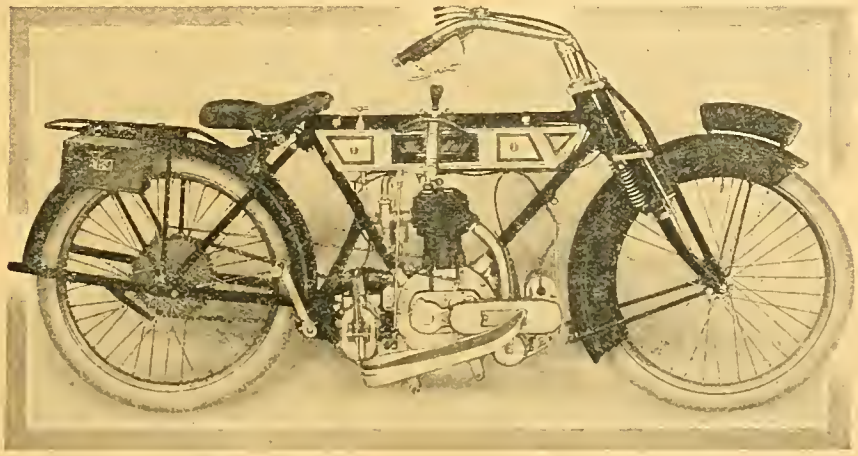
A 4 h.p. Three-speed Bradbury.

89×89 MM. ENGINE; COUNTER-SHAFT GEAR AND CHAIN DRIVE.

THE latest model Bradbury is a type eminently suitable for side-car work, and in general appearance is something like the 4 h.p. two-speed model. The engine is the standard 89 × 89 mm. 4 h.p. single-cylinder, having a cubic capacity of 554 c.c. As usual, it is mounted in the frame in the distinctive Bradbury fashion, but an auxiliary stay makes a triangle with the seat tube and the bottom bracket. This arrangement forms a sound bed for the three-speed counter-shaft gear, which is of the single sliding member type, with dog clutches to engage the high and low gears. Both gearshafts run on ball bearings, and the ratios provided are 5.1, 8.4, and 14.8 to 1.

The clutch is of the cork insert type, and is controlled from the handle-bar; a gear and quadrant kick-starter is fitted. The drive is by chain throughout, and the gear box is arranged to slide on the bottom bracket so as to provide a simple adjustment for chain stretch. An excellent internal expanding brake is carried on the rear hub, and is of such a diameter as to allow of smooth action and full power.

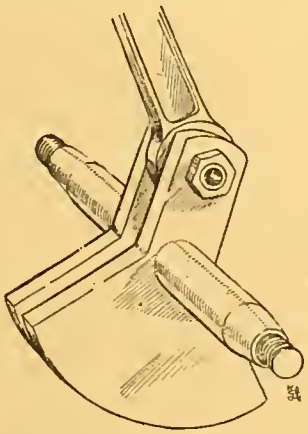
The machine is well fitted up, and the specification includes aluminium foot-boards, two stands, extra heavy tyres, pan seat, and sensible mudguards.



The new 4 h.p. Bradbury with three-speed counter-shaft gear box and chain drive.

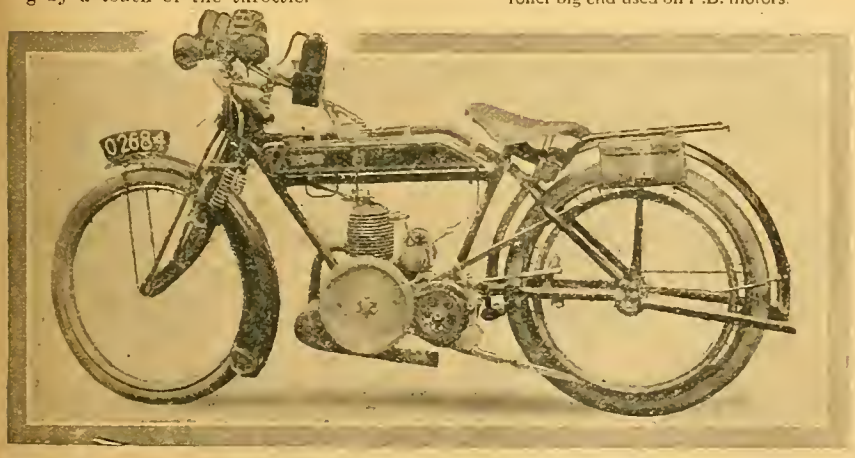
The Two-stroke Wizard.

A NEW two-stroke motor cycle has recently been prepared for the market by the F.B. Two-stroke Company, of Hay Mills, Birmingham. Two types of engine are made—a 3½ h.p. 78 × 86 mm. and a 2½ h.p. 70 × 70 mm. Either model may be obtained with single gear or Albion two-speed bottom bracket gear, and the 2½ may be obtained in the form of an ultra lightweight. On a recent visit to Birmingham we were able to test a 2½ two-speed model through the thick traffic and in the neighbourhood of the city. The machine was absolutely new, in fact we saw the engine started up for the first time, and yet it was full of life on the road and proved an excellent hill-climber. In spite of the absence of a clutch the machine is wonderfully easy to control in traffic, for it will fire at such a low road speed that one can crawl behind a dray and shoot through any convenient opening by a touch of the throttle.



Built up crank, hollow crank pin, and roller big end used on F.B. motors.

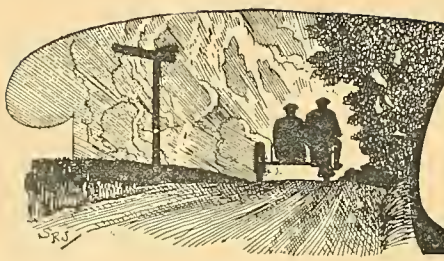
The 3½ and 2½ models are very similar in construction, so that a description of the smaller machine will cover both models. As is usual with two-stroke engines at the present time, a measured quantity of oil is mixed with the petrol, and this is carried out by means of a pump directly connected to the tank. The engine is of the three-port type and has the transfer pipe cast with the cylinder. The crankshaft is built up and a Hoffmann roller bearing big end is used. A domed piston with rings at the top and bottom is employed, the crankshaft bearings being of phosphor bronze and of great length. The large outside flywheel is keyed to the shaft and carries the driving sprocket which is bolted to it by six set pins. A chain transmits the power to an Albion two-speed gear, and thence a belt drive is employed. 26in. × 2in. tyres are fitted, and the equipment of spring forks, mudguards, carrier, etc., is excellent. A U.H. magneto is carried behind the cylinder and driven by chain direct from the crankshaft. The machine is finished in black and gold, and looks very smart, and this, with the very reasonable price, makes the Wizard a tempting proposition.



The latest two-stroke Wizard motor cycle.

The Edmund Spring Frame.

A few days ago we were able to test the Douglas-engined spring frame Edmund illustrated in *The Motor Cycle* of July 9th. The combination of the smooth running horizontally-opposed engine in conjunction with the clever frame design rendered the machine one of the most comfortable we have ever ridden. The machine was driven at a smart pace over a very bumpy stretch of road, but the leaf springs and coil shock absorbers reduced even the worst bumps to such a degree that no jar of any sort was felt, but only an easy undulating motion.



The Springing of Sidecars.

A Brief Description of the Most Generally Accepted Methods.

It will be generally admitted that, in spite of the simplicity, not to say crudity, of the sidecar form of passenger-carrying attachment, it has easily proved itself the most popular solution of the passenger problem in connection with motor cycles, and so far has it gained in popular use that, at the present time, it is scarcely too much to say that over one-third of the machines one sees on the road are fitted with sidecars, whilst the many models especially designed for this purpose exhibited at Olympia were very notable. One of the most singular points in connection with motor cycles and sidecars is the extremely unequal distribution of comfort between the two people concerned. Indeed, the writer cannot recollect any other form of vehicle in which the driver is so little provided for and the passenger so elaborately. This, of course, is a very excellent state of affairs from the sidecar passenger's point of view, and there are many who hold that a really well-sprung sidecar is far more comfortable than the best seat on the finest motor car. This is by no means an exaggeration of the case, and that it should be so must be put to the credit of the ladies who form the majority of sidecar passengers. It is rather singular, however, that, for all the years that have been devoted to its development, the properly sprung motor cycle, such as the Indian, P.V., Bat, Edmund, T.M.C., and N.S.U., is still as much an exception to the general rule as ever it was. Motor cyclists must, therefore, be regarded as a hardy race, who look upon nearly all the other qualities which their machines possess as being superior in importance to mere personal comfort.

The Simplicity of the Problem.

In view of the fact that in the case of the sidecar the passenger has simply to be suspended from a rigid chassis, and that there is no need for any mechanical connection such as steering or control gears between the sidecar and the chassis,

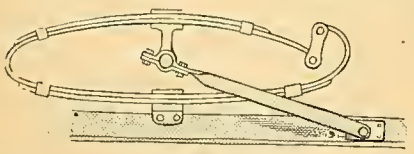


Fig. 1.—Bramble.

the problem presented by the springing of such an affair is an exceedingly simple one, and it is pretty obvious, as shown in the accompanying sketches, that almost any design will serve the purpose. This is why, from the sidecar passenger's point of view, this form of attachment is superior to almost any cycle car, as it is practically impossible to obtain in the latter the same, or anything like the same, degree of luxurious comfort as is obtained in the former, for the simple reason that, in the cycle car (as in the ordinary car), the passengers and the principal mechanisms, such as the engine, are carried on the same chassis, and the two are sprung in exactly the same manner, except that the passenger is furnished with an upholstered cushion and the engine is not. It is, however, hardly necessary to point out that if the motor car were sprung in the same beautiful manner as are most sidecars it would be quite impossible to hold it on the road at any speed.

A Usual Method.

The most common and generally most satisfactory form of spring adopted is that in which both the front and rear portion of the car are supported at each side on the ends of long, curved leaf springs, in which generally about three or four laminæ are used. The principal considerations of comfort are directed to the rear part of the suspension, as it is clear that if a very easy attachment is made in the front, or "toe," of the car, a forward and backward see-saw motion is bound to develop and would be decidedly uncomfortable. In some cases the rear ends of the leaf springs are coupled directly to pins attached to the sidecar body, but in others shackles of a simple type are employed. Many makers employ this form of suspension, which is, generally speaking, considered satisfactory. One of the objections to it is, however, that in long leaf springs of this kind, unless the very finest material is used, and they are tempered with great skill, it is extremely difficult to get them to stand up to their work for a very long time without slightly sagging and getting weaker. The sidecars used by the writer for two successive seasons showed this to a large extent, about six weeks' running being sufficient to drop the whole sidecar body about three inches or so, so that the shackles which were previously employed had to be taken out.

Bramble.

A highly individual form of suspension is that employed on the Bramble sidecar, which is shown in two of the adjoining sketches. The sidecar body is carried in the rear at each side on a peculiar shaped full elliptic spring, of which the leaves are carried on in a complete loop and shackled to one another at their ends. The strengthened frame of the sidecar seat forms practically the chassis of the vehicle, the wheel being carried on a plain axle, which passes through holes cut for it in the flank of the sidecar body. The form of these springs has recently been somewhat modified, though the principle remains the same. In front, two brackets extending from the side of the body enable the forward portion to be hung on a couple of ordinary helical springs.

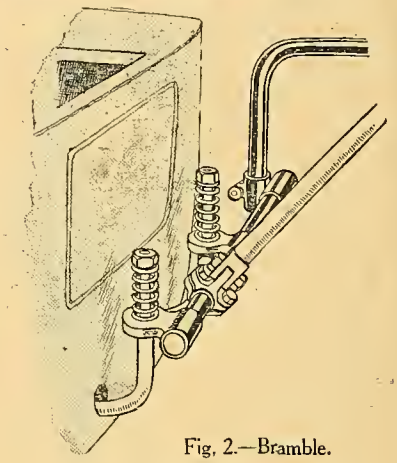

Fig. 2.—Bramble.

Calthorpe.

The Calthorpe system resembles the standard form already described, except that helical springs are employed under the toe of the body, whilst the rear is supported on long C springs attached to what may be described as an underslung chassis, in order to get the weight as low as possible. The way

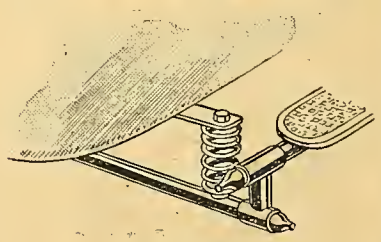

Fig. 3.—Calthorpe.

these front springs are arranged is shown in the sketch, in which will also be seen rather a neat point, namely, the fixing of an aluminium footstep on the chassis tube.

Gloria.

The Gloria sidecar differs from other designs inasmuch as it embodies a spring wheel arrangement; that is to say, the whole of the chassis is sprung in addition to the ordinary separate leaf springing of the body itself. In this case, the sidecar hub is supported on a crescent-shaped crank, which is pivoted on the chassis frame. This crank terminates at one end in a plunger, which works in a short

Springing of Sidecars.—

cylindrical casing against a nest of helical springs, a small rebound spring being fitted at the top. The principal function

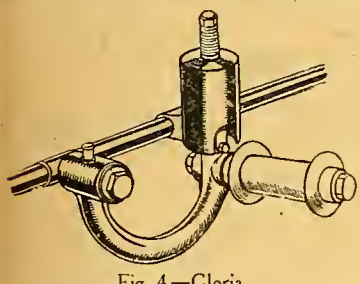

Fig. 4.—Gloria.

of this design is to reduce the amount of unsprung weight on the sidecar wheel, and so enable it to enjoy a considerably longer life.

V.A.L.

In the V.A.L. sidecar the front of the body is supported from the chassis on a couple of plain helical springs in much the same manner as the Calthorpe, but in the rear quite an individual form of suspension is adopted. Some details

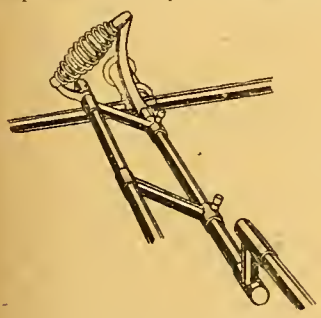

Fig. 5.—V.A.L. sidecar.

of this are shown in the sketch. The chassis is a perfectly rigid affair, and on the axle tube is mounted a tubular frame, which is free to swing up and down on bearings. This frame is connected to an arm supported by the chassis through a coiled spring at each side. This arrangement no doubt effects a considerable reduction in weight and certainly makes a very neat and satisfactory construction.

Rex Sidette.

In the Rex sidette C springs of the usual form are employed, and these are supplemented by the attachment of shock absorbers similar to those carried on many cars. As shown in the drawing, each shock absorber consists of two helical springs, which work in compression, and one is used at each side. The long shackles employed will be noticed.

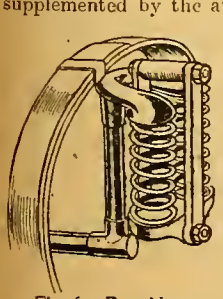

Fig. 6.—Rex sidette.

Williamson.

A form of suspension closely resembling that used on ordinary cars is adopted on the Williamson, in which the rear portion of the body is carried on an inverted half-elliptic spring, swivelled in front and shackled at its rear end, whilst

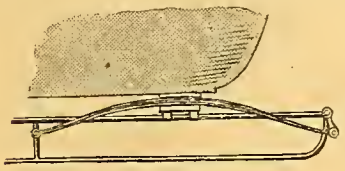

Fig. 7.—Williamson.

the forward portion of the car is attached to a short, transverse spring, which is shackled at both ends. No doubt this springing forms a very satisfactory arrangement.

Scott.

One of the first sidecars on which an attempt was made to provide a springing rather out of the ordinary, both in construction and comfort, was the Scott, upon which a simple and thoroughly practical arrangement is employed. This,

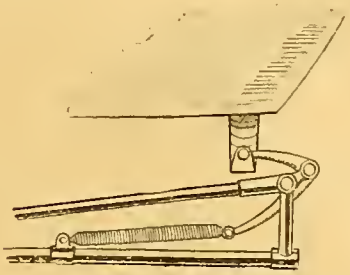

Fig. 8.—Scott.

as shown in the illustration, consists in the hanging of the sidecar body on two cranks, which are connected up to a long pivot bar, supported in trunnions carried by the sidecar axle tube. This bar carries a third lever or bell crank, which works against a pair of spiral springs. The arrangement is quite simple, and certainly yields a very high

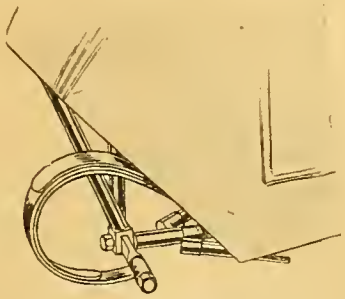

Fig. 9.—Scott front spring.

degree of comfort. In front, the spring employed is a single C type, with three laminations rigidly attached to the toe of the body and pivoted to a special extension piece on the chassis frame. This spring is clearly shewn in the second illustration.

Sydenham.

Quite an elaborate system is employed on the Sydenham sidecar. This, as shown in the sketch, takes the form of a telescopic shock absorber, rigidly sup

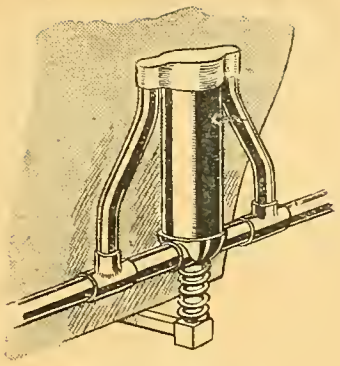

Fig. 10.—Sydenham.

ported from the chassis frame on each side. The tubular chamber contains a plunger, which works in grease and is fitted with coil springs, so that a rebound effect is largely neutralised. It will

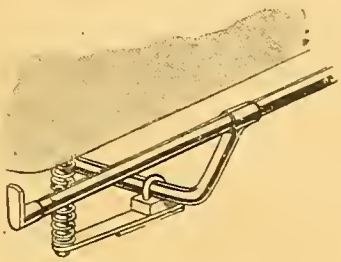

Fig. 11.—Sydenham.

also be noticed that a second rebound spring is fitted underneath the shock absorber chamber, which forms part and parcel of the chassis frame construction. The front portion of the Sydenham vehicle is supported at each side of a single helical spring working in com-

Fig. 12.—Canoelet.

pression. This is carried on a bracket, supported on a single lug, from one of the cross members of the chassis frame, and this, no doubt, allows the toe of the sidecar to be lifted or dropped, according to the desires of the passenger.

Canoelet.

Another original form of springing is that used on the Canoelet machine, in which the chassis is of a peculiar construction. Plain quarter-elliptic leaf springs are used in front, and curved springs of the same type in the rear. In order to prevent the back of the body damaging itself against the spring blades the latter are fitted with a rubber buffer, as shown in the small detail sketch.

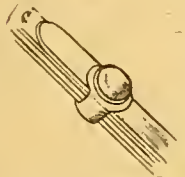

Fig. 13.—Rubber buffer on Canoelet spring.

Springing of Sidecars.—

P. and M.

In the P. and M. machine, although the sidecar body is supported in the standard way—that is to say, both the

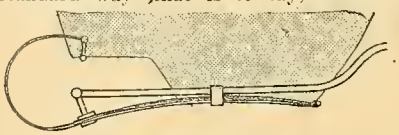

Fig. 13A.—P. and M.

front and the rear are carried on the ends of long springs—a slightly different arrangement is adopted, which is clearly shown in the illustration.

Montgomery.

To the ordinary C springs in the rear of Montgomery sidecars, a transverse leaf spring is arranged, as depicted, for the front portion. This notion is neat and exceedingly effective, though it has

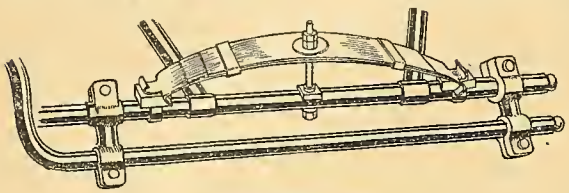

Fig. 14.—Montgomery.

the incidental objection that the slides at the end of the spring and also the

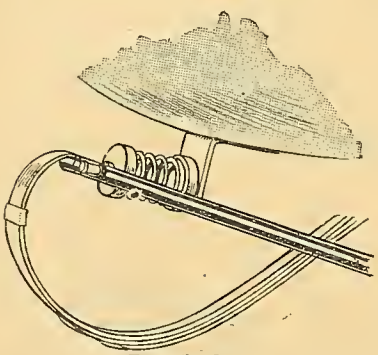

Fig. 15.—Ivy.

central guide pin require a good deal of lubrication.

Ivy.

In the Ivy sidecar the forward portion is carried on helical springs, as illustrated, whilst the rear part of the body

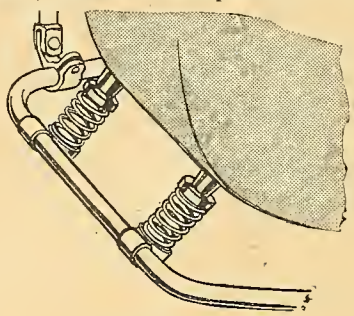

Fig. 16.—Ivy.

is indirectly suspended from large C springs by secondary coil springs, a bar being used to connect the two, and also for the purpose of preventing swaying from developing.

Watsonian.

A peculiar suspension is used on the Watsonian sidecar. Here one has a peculiar S-shaped form of spring, one end of which is attached to the sidecar body, whilst the other is pivoted on a bracket supported on one of the torque member tubes. Instead of being pivoted in its centre this is supported on a short coil spring maintained in tension.

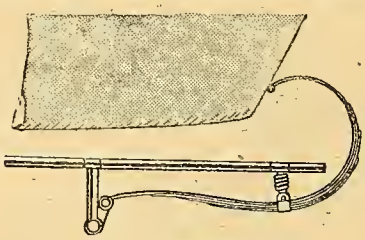

Fig. 17.—Watsonian.

The latter serves to take up small shocks, whilst the larger shocks are, of course, absorbed in the leaf spring.

In the specially light Watsonian model a compound form of spring of the type which is used on the Brooks saddle is employed, and it appears to be an excellent idea, as it serves the purpose well.

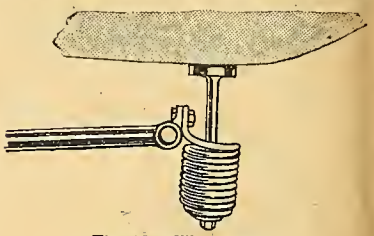

Fig. 18.—Watsonian.

Swan.

In the Swan sidecar a peculiar form of chassis construction is employed. The rear part of the body is supported from

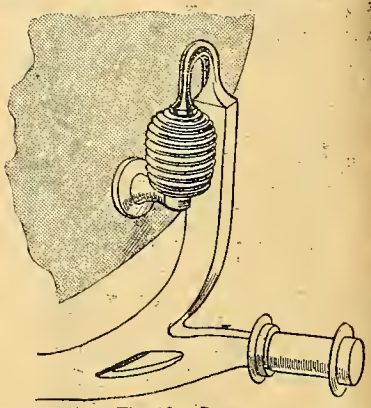

Fig. 19.—Swan.

an upwardly inclined extension of the frame by means of a simple tension

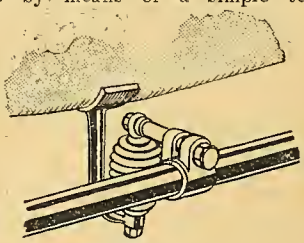

Fig. 20.—Swan.

helical spring, as shown in the illustration, whilst an equally simple device is employed at the toe of the body.

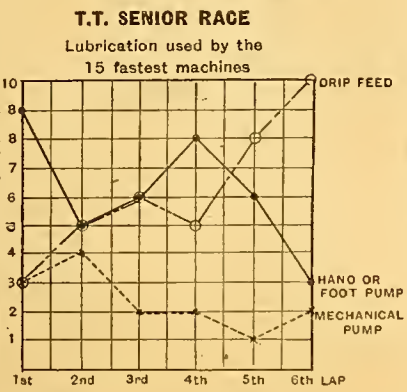
Lubrication of Racing Machines.

A Comparison of the Methods of Lubrication used in the Senior T.T. Race.

THE contemplation of the recent Tourist Trophy Race leads one to a comparison of the methods of lubrication of motor cycles, as owing to the long distance covered at great speed during the race by the machines, it follows that the engines with the best lubrication will, *ceteris paribus*, maintain their speed most satisfactorily to the end of the race.

Loss of speed is due to other causes besides lubrication, but it cannot be disputed that lubrication is a most important factor. As in the comparisons which will be made, the speed of a number of machines, and only the fastest in each class, are taken into account, the other causes for delay are eliminated, such as punctures, falls, etc., and these delays equally affect all classes.



The systems of lubrication employed may be divided into three classes:

(1.) Drip feed (foot or hand-operated spring loaded pump in combination with a regulating valve).

(2.) Pump (foot or hand-operated).

(3.) Mechanical pump.

Briefly, it may be stated that all machines except the Coventry and foreign makes used the "drip feed." The "pump" was used by the Coventry makers, while the "mechanical pump" was fitted by the foreign manufacturers. A simple comparison can be made by comparing the systems used by the fifteen speediest machines at each lap. The lap speeds are taken from *The Motor Cycle*.

	1st lap.	2nd* lap.	3rd* lap.	4th lap.	5th lap.	6th lap.
Drip feed	3	5	6	5	8	10
Pump	9	5	6	8	6	3
Mechanical pump	3	4	2	2	1	2

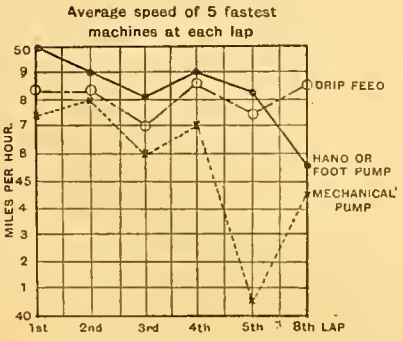
*A machine not fitted with any of the above systems but with a combined suction drip feed and hand pump was one of the fifteen.

A further comparison is made by taking the average speed of the five fastest machines of each class at each lap, the comparison being tabulated in miles per hour.

	1st lap.	2nd lap.	3rd lap.	4th lap.	5th lap.	6th lap.
Drip feed	48.3	48.3	46.3	48.5	47.5	48.5
Pump	49.8	49.2	48.1	49	48.2	45.6
Mechanical pump ..	47.6	48.1	46	47	40.5	44.5

The fall in speed for the third lap was due to the riders having to stop to fill up their tanks; and taking this into account it will be observed that there is no appreciable variation of speed during the entire race for the motor cycles fitted with "drip feed," while there is a decided fall for the other systems. Diagrams have been plotted for the convenience of readers.

The fastest lap (53.23 miles per hour) was made by a Scott fitted with a "drip feed," while of the first fifteen machines to complete the race ten were fitted with "drip feed," three with "pumps," and two with "mechanical pumps."



PUMP 48·8, 49·2, 48·1, 49, 48·2, 45·6 MILES PER HOUR.
DRIP FEED 48·3, 48·3, 46·8, 48·5, 47·5, 48·5.
MECH PUMP 47·6, 48·1, 46, 47, 40·5, 44·5.

Finally, as regards lubrication for two-stroke engines, no other system except "drip feed" was used in the Senior or Junior races, which points to the conclusion that this system is also eminently suitable to an engine of this type.—R. H. CARPMAEL.

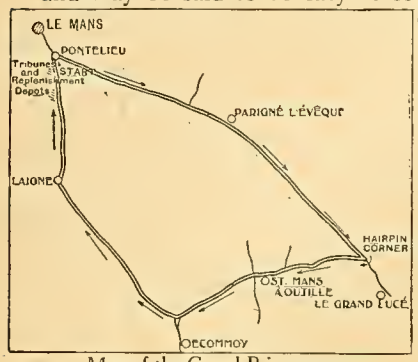
The Motor Cycle Grand Prix.

A Description of the Thirty-three Miles Course near Le Mans.

LAST year the Grand Prix race was held in conjunction with the car race at Amiens. This year the car race is already a thing of the past. A great many of the most noted riders in this country have already entered for the race, which will be contested on the Circuit de la Sarthe, which is near Le Mans, on August 15th. The course, an extremely fast one, is approximately thirty-three miles long, and with the exception of one or two points is in good condition, and may be said to be easy in comparison to the Isle of Man T.T. race course. Motor cycles with a cubical capacity not exceeding 350 c.c. will cover seven laps of the course; those with engines not exceeding 500 c.c. nine laps; and cycle cars eight laps.



Map of the Grand Prix course

The start of the circuit will be at a point to the south of Le Mans, in a village known as Pontelieu. Immediately after the start is made, the road takes a right-hand bend, which, being in a village and skirted with trees and a gutter, will have to be taken carefully. Having got round this corner, the course continues over a long level stretch of at least five miles, until we come to the village of Parigné-l'Evêque. There is a slight rise in this village, and afterwards the road drops slightly and there is for miles a beautiful stretch of good level road until the turning, a very sharp hair-pin, is reached, one kilometre from Le Grand-Lucé. Here we turn round the hairpin mentioned and proceed along a rather twisty road. However, all the corners on this road can be taken at a speed of about fifty miles an hour. Near the village of St. Mars d'Outille there are one or two very slight bends, and the surface is somewhat bumpy. The road again assumes a rather twisty course in the direction of Ecommoy, where we take a slightly uphill road and drop down again round a right-hand bend, just missing the town of Ecommoy, and turning in the direction of Le Mans.

Then follows a good stretch of about two or three miles, through a long avenue, where the sunlight shining through the trees is very dazzling. We take a fairly easy right-hand bend, then an easy left-hand turn, and come to the straight stretch of two or three miles, passing through the little village of Laigne, afterwards getting a clear view of the road for about five miles. This is the last stretch, and we are now nearing Le Mans again. On this stretch, about two kilometres from Le Mans, the tribunes will be fixed and the replenishment depot. There will also be a grand stand erected at Pontelieu, at which point there is a statue or memorial erected in the centre of the road to the soldiers who have fallen in French warfare in times gone by. The roads on the whole are well kept, and in several places repairs are being carried out preparatory to the race.

We should say that the course is much faster than last year's motor cycle Grand Prix course at Amiens. The circuit is practically the whole way lined with beautiful trees; the tall pine trees which one sees on several parts of the course are very impressive on the long straight stretches of road.

It will be interesting to see what speeds motor cycles and cycle cars accomplish on the course this year. To give some idea of the speed possible, we are assured that M. Bablot on a Delage car can do a lap of this circuit at ninety-seven miles an hour. Taking this into consideration, we should set the average speed of the 500 c.c. motor cycles at about 55 m.p.h. and that of the cycle cars at about ten miles an hour less.

The following are the entries already received:

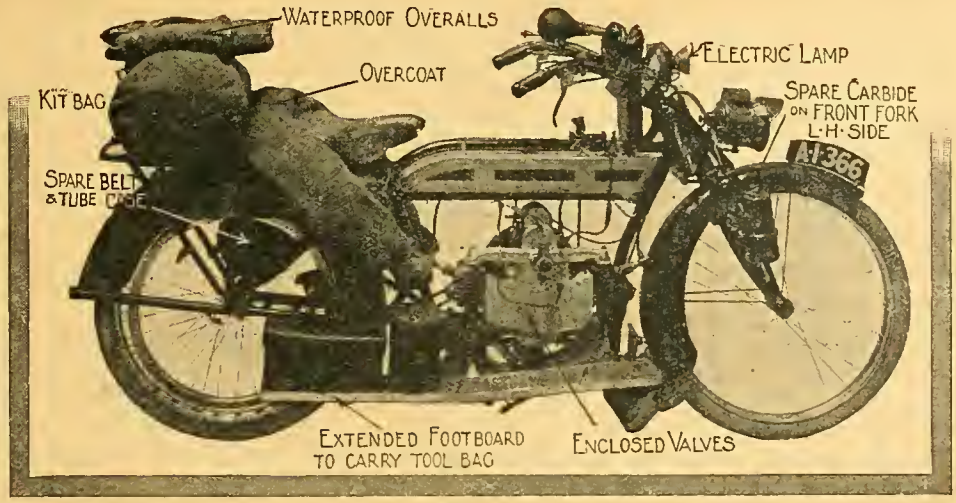
A NEW ZEALAND CHAMPION.

J. Boucher with the 3½ h.p. Rudge on which he recently won the 10 lap handicap, 15 lap open handicap, and the 10 mile championship of New Zealandfor 500 c.c. machines, at the Napier (New Zealand) race meeting.

THE DESIGN OF MILITARY MOTOR CYCLES.



A Douglas machine equipped for military work.

ALTHOUGH to the writer's mind the ideal machine for military despatch riding is not yet on the market, the most suitable type is that which one would ordinarily choose for winter riding or cycle camping.

In order to be passed by the military authorities, the machine must conform to various regulations. The engine must be a single-cylinder of about 500 c.c. capacity with dimensions of not less than 84 mm. bore and 84 mm. stroke. A certain number of horizontal twin-cylinder machines of less capacity will, however, be accepted.

Necessary Qualifications.

All types of machines are not, however, equally suitable. Let us first consider the conditions under which the machine will be used.

It has to be ridden under all sorts of weather conditions and stand unprotected from the elements at night. It has to be ridden over any kind of road, good, bad, indifferent, level, and hilly, over farm roads that consist principally of ruts and loose stones, and, when passing troops on the march, as often as not in the ditch. When delivering messages at night it has to be ridden over the fields where the troops may bivouac. On the open road high speed is essential, as there is no speed limit when carrying despatches; on the other hand, when marching with a column, slow speed is a *sine quâ non*, and the cycle should then be capable of being driven comfortably at not more than four or five miles an hour, otherwise one has to get off and push.

Light Weight and Variable Gear Desirable.

No doubt on the score of reliability, which is the very first essential, the Army regulations would appear to encourage a heavy, powerful machine, but, provided reliability can be ensured, the lightest machine that will do the work should be used.

When carrying messages short distances, the machine, loaded with all the rider's baggage, has to be pulled up time and again on to its stand. With a heavy machine, this requires a good deal of exertion at the end of a long tiring day. It must also be remembered that the greater part of the riding has to be done in lanes where, owing to twists and turns, the powerful machine cannot get along any faster than the lightweight. And when it comes to pushing, the lightweight scores heavily, and is the envy of the owner of the machine built for combination work.

With a lightweight a three-speed or multiple gear is a great advantage; it not only allows of a high speed on the level, but, when overtaking troops on a steep hill, when horse-drawn vehicles are apt to get out of line and take up most of the road, one can crawl up and thread one's way in and out without having to dismount. It is further a great help for slow riding in the column, and for this purpose a good clutch that can be continually slipped, but which will take up the drive again directly it is let in is required. A leather-faced clutch, if continually slipped, will sooner or later glaze or burn and will continue to slip when it is required to hold fast, and also has a habit of slipping if oil works out at the bearing and gets on the coned face. On the other hand, a plate clutch, which is ideal for slipping, is very difficult to keep entirely free, especially in cold weather.

Weatherproof Finish.

As the machine is continually exposed to the wet it should be of the "all black" type or else suitably enamelled all over, or as far as possible all the bright work covered. Most of the nickel finish on any cycle is worse than useless. Under war conditions it would have to be done away with, and during annual training there is very little time for polishing up, and the plate soon looks bad.

Mud guarding should be as effective as possible, not only to reduce unnecessary cleaning, but also to protect the rider. The engine and the transmission gear should be totally enclosed, and the magneto should be in a position where it is well protected. There is no reason why on the majority of engines the valve stems and springs should not be enclosed as they are on a motor car engine. Besides tending to quieten the engine, it considerably reduces the wear on the valve stems due to lack of lubrication and abrasion from mud and dust, and also makes cleaning the engine very much easier. From the point of view of protection the all-chain drive running in an oil bath, yet readily accessible, is no doubt the best, and I think that the disadvantages of this type of drive are largely imaginary.

The Design of Military Motor Cycles.—

In short, the ideal machine should be capable of being easily cleaned with a hose, or by throwing buckets of water over it, without any damage resulting.

The machine should be effectively silenced. The usual cocoa tin with holes punched in it ought to be replaced by a real silencer, even if it is more bulky. In actual warfare if you were in the enemy's country the noise made by the average silencer would very speedily call attention to your whereabouts. On the other hand, some sort of cut-out should be permitted to relieve back pressure.

As it is very necessary that a military machine should be extremely flexible, with a quick pick up, a really good carburetter is indispensable, so that the engine, even if cold, starts straight away whenever required.

Standardised Controls.

While on the subject of carburetters one is reminded of handle-bar controls. Why is it that the direction of movement of handle-bar levers is not standardised? Some carburetter controls are on the right handle-bar, some on the left, some throttles open towards you, some away from you, and I have known the air lever to open in one direction and the throttle in the other. The same thing applies to the spark advance lever and the decompressor lever.

In the case of subsidised motor vehicles the War Office lay down rules as to the different positions of the levers and gate changes, so that in case of mobilisation drivers would have no difficulty in changing from one vehicle to another. If the War Office or the manufacturers would only do the same thing in the case of motor bicycles and standardise the handle-bar controls, it would be a move in the right direction.

A kick starter is advantageous when riding in the column, but is not essential. Good brakes should be fitted and kept adjusted.

Nuts and bolts should be well secured. Military cycles get a good deal more jolting about and more vibration than the ordinary roadster machine, and some makes seem to contract a habit of shedding nuts and other loose impedimenta. There is not much opportunity of examining a machine thoroughly and seeing that everything is screwed up tight, and in bad weather cycles soon get caked up with mud, which makes examination and discovery of loose or missing nuts still more difficult.

Lamps and Generators.

There is a good deal of night riding to be done, and a good head lamp should be fitted, one which gives a good powerful beam and will not rattle itself to bits or blow out. The generator, too, should be one which goes on working without being coddled, gives a steady, even pressure of gas, and can be easily and quickly cleaned. It is also well to carry a spare tin of carbide. An electric lamp fitted with a dry battery of the flash lamp type, such as can be bought in any town, is a very handy thing to have fitted. It can be used as a head lamp in case of the acetylene lamp failing, and can readily be taken off the machine to find one's way on foot about a camp at night.

A large petrol tank should be fitted and replenished at every opportunity, as there are occasions when one finds oneself running short of petrol in a village where it cannot be procured and the road to the nearest supply is held by the enemy.

How to Carry the Kit.

As the motor cyclist has to carry the whole of his kit on his machine, it should be fitted with a good sized carrier. The best way of carrying one's kit is in a round-bottomed canvas bag, which can be used as a pillow at night. The telescopic box type of luggage container is not so good, as it is difficult to pack without the contents rattling and knocking themselves and the box to pieces, and, further, in many cases, the box cannot be removed from the carrier without unpacking it to get at the heads of the screws which hold the clips.

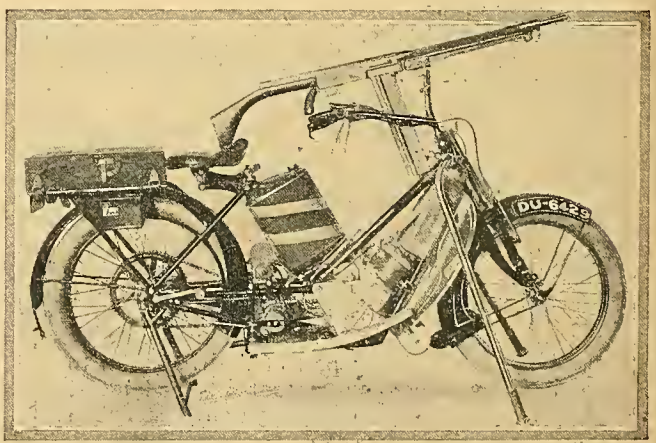
The tool bags should be constructed so that the contents can easily be got at without unpacking the whole bag. The strap and buckle fastening is better than some of the patent fasteners, which are apt to come adrift on the road. A wallet for gloves, goggles, and other oddments which have to be got at quickly is an accessory which is very useful.

Tyres and Detachable Wheels.

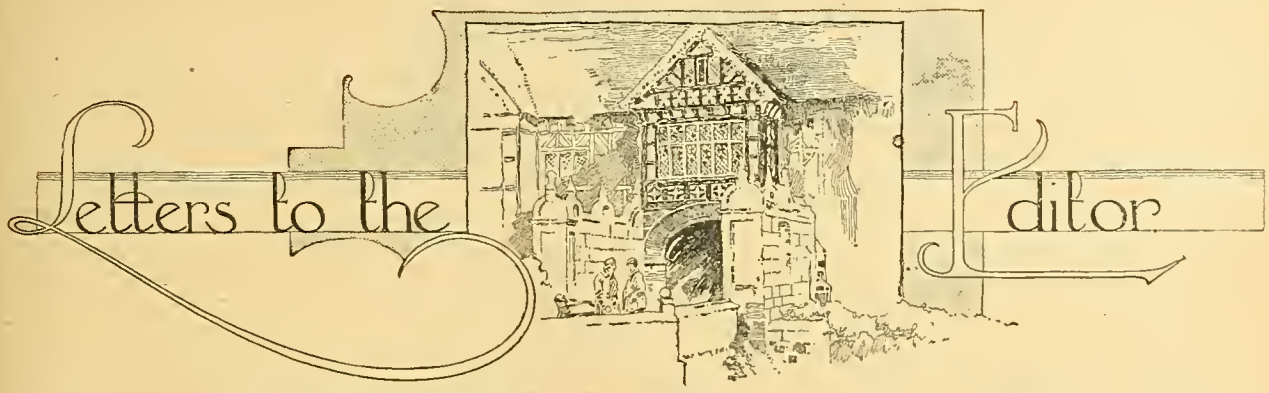
Good heavy non-skid covers should be used to prevent side slip and to minimise the risk of punctures. To deal rapidly with punctures detachable wheels would be a great assistance, and no doubt if the Military Authorities built or designed machines for their own use standardised detachable wheels, which could be used either as a front or back wheel, would be specified. A spare wheel complete would be carried in the transport, and would fit any of the machines.

To sum up, a military cycle should be as light as possible, consistent with reliability, speed, and flexibility, should be mud and weatherproof, silent, and with good petrol and baggage-carrying capacity. In the writer's mind there is no doubt that the most suitable machine is one fitted with a twin engine rather than a single; it is certainly more silent and flexible, and has the advantage that one can on occasion get home on one cylinder. Of the machines on the market at the present time the one which comes nearest to the ideal sketched above is a V twin, but this is not admissible under the War Office regulations. There may be disadvantages in the V type of engine, but in permitting only the horizontal type of twin engine the authorities are considerably restricting the choice of those who prefer a twin to a single-cylinder engine.

SPECIAL RESERVE.



A 3¾ h.p. Scott to which is fitted a quick firing gun made by the Coventry Ordnance Works and weighing 16 lb.



The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Marking System in the Scottish Trials.

Sir,—The comments of "Ixion" and the letter of Mr. Campbell McGregor certainly seem to me to bear out what I said in a letter to you some little time ago, viz., that too much prominence is given in trials to the ability of a rider to ride to a schedule and too little to hill-climbing ability, which, in itself, proves reliability of a most desirable kind. Mr. McGregor's explanation is very clear and lucid, but I, for one, am certainly of opinion that his silver medallist who has climbed all hills, scored a perfect sheet for condition, and lost only one mark for a time error, has made a more meritorious performance than the gold medallist with whom he is contrasted, who has climbed five hills only, lost fifteen marks for condition, and gained full marks for time. I certainly cannot see how the fact of a rider being a few minutes early proves that his machine is not reliable; if he is late the matter is, of course, different, though even this may be an error of judgment and no fault of the machine.

I quite see the point of the Edinburgh club, but I cannot help thinking that they lay undue stress upon riding to time, and I would suggest that, if one mark were deducted for every minute early or late when the allowed ten minutes has been exceeded, quite a sufficiently large penalty would have been incurred. JOHN BONYTHON.

Speedometer Drives.

Sir,—We notice a letter in your issue for July 23rd from Messrs. Rudge-Whitworth, Ltd., illustrating the method which they have adopted of drive for speedometer from their front wheel. We should just like to mention that we have for years recommended such a fitting, and we have at various times approached the leading motor manufacturers with a view to getting them to standardise their hubs for a fitting of this kind. The difference, however, between ours and that described by Messrs. Rudge-Whitworth is that we suggest the large driving gear of the speedometer being screwed (left-handed) to the hub flange direct instead of soldered, so that the tendency of the drive would be to keep this locked. The special features we claim for this are neatness, rapidity and ease of fitting, and the dispensing with clips and screws for fastening the spokes. The difficulty, of course, is that it would become necessary for the various manufacturers to standardise a design of this kind to justify us in stocking our instruments with suitable fittings. Needless to remark, it overcomes at once all difficulty in the correct centring of the gear wheel, which is a most important detail in the fitting of a speedometer. THE JONES SPEEDOMETER.

MARKT AND CO. (LONDON), LTD.
F. E. Dickinson.

[This plan has been recommended over and over again in our pages by "Ixion" and others, and we are glad to note that leading manufacturers are taking it up.—ED.]

Mrs. Wheyman, of Charlton, who has recently become the possessor of a 6 h.p. Enfield sidecar combination.

Sir,—Having regard to "Ixion's" article in a recent issue regarding speedometers, I give my experience of a motor cycle speedometer for the benefit of makers.

This season I fitted a new speedometer to my machine, and with regard to its recording capabilities have no complaint to make, but the method of attachment was so questionable that, before it had run 500 miles, the bracket which carries the dial snapped off for no apparent reason, since it was correctly fitted, and the machine has Druid spring forks; and dropping it broke the shaft. The makers supplied a new bracket free of charge.

Whilst I was on tour three weeks ago the speedometer drive "gave up the ghost," but as it was raining at the time, the shaft was disconnected, and the dial was left on the machine, clamped to the handle-bars as usual, without anything to drive it. For some reason not apparent, the bracket again broke, dropping the speedometer in the road, and, as I was not fortunate enough to see it go, I have lost the speedometer altogether, and all this trouble and expense happened inside 1,400 miles.

It is little items such as this that are unavoidable—at least by the users—that increase unduly the cost of motor cycling, and cause aspirants to the sport to hesitate on the score of such heavy incidental expenses. LK 1476.

Overseas Repuirements.

Sir,—Noticing in your Overseas Supplement that you were desirous of obtaining readers' ideas of ideal machines, I hereby wish to give you mine.

In the first place, I would divide the machines into two classes, viz., city and country. For the greasy tram blocks, etc., of the city a light, easy starting, even firing twin with shortest possible wheelbase is required.

The most important part of the country or touring motor bicycle is the frame. The engine is comparatively a minor detail; any decent engine will suffice. The frame must be very strong, as also the rims, spokes, saddle pillar, etc. The majority of English frames are not nearly strong enough. They are light, and break up very easily. On my machine the down tube has broken three times. I have used up two front and three back rims, and twenty-five spokes. The steering tube has broken, and also the saddle pillar.

My ideal machine would be: Strongest frame procurable, short wheelbase, dropped top tube, rear springing (this is absolutely necessary), 26in. or 28in. wheels, Roman rims, heaviest gauge spokes, wide mudguards with good clearance for mud, side extensions, semi T.T. bars, back adjustable footrests, pan saddle on sprung saddle pillar (apart from sprung wheel), three-gallon petrol tank, half-gallon oil tank, Brampton forks, 2½in. Kempshall tyres with security bolts, Dunlop 1in. belt, and Forward fastener. All-black finish—not a spot of nickel anywhere. Handle-bar control throughout. As to the engine, a 5 h.p. twin J.A.P., low compression, would be about the best for a solo mount, with adjustable pulley. Three-speed gears, etc., are not absolutely necessary, and it is doubtful if they are worth the extra weight and cost. Lubrication—semi-automatic. Minor details are rustless spokes, large screw-on filler caps, oil and petrol gauges dispensed with. If decompressor is fitted it should be operated by the lever that is fitted for the front wheel brake. (Front wheel brakes are unknown out here; they are a nuisance.) Pedalling gear not to be fitted. Kick starters or free engines are not essential. Regarding crank case clearance, I think the average clearance is sufficient, and as we have lots of muddy roads it is as well to keep the weight as low down as possible. Magneto could be set fairly high up. Carburetter of the two-lever type.

What we want is a good sturdy machine that possesses a long life, that will keep going through all weathers, and that will plug up long hills at medium speed. It must be fairly light on petrol, and not side-slip at every possible opportunity. When cleaned for the first time after twelve months it shall still be a self-respecting motor bicycle.

Melbourne, Victoria. R. JOHNSON.

Sir,—For some time past I have been thinking of writing and congratulating you on the enterprise shown in connection with the Overseas trade and helping us to get machines built for use in the Colonies and not ones that have been adapted, or, as often as not, not even adapted. My personal opinion is that the bugbear of rocks, etc., found lying on roads has rather been overdrawn, though a certain amount of clearance, more than that given to home machines, is required. The great danger to provide for is not so much bad roads as the meeting of them unexpectedly. Handle-bar control of gears is not universal, and this is one of the things absolutely essential for Colonial machines. One meets dust feet deep, wet sludge, and large ruts so unexpectedly that one has no time or inclination to take the feet off to find and put the low gear in. The result is that a great risk is run of having a bad sideslip in the dust or having the wheel or tyre simply sheared off in a rut while going at about 25 m.p.h.

One can hardly over-estimate the blessing a handle-bar control gear would be in a case of this sort. To cut out and change the gear, and tick along at 4 m.p.h. would be the certain work of about ten seconds, and the bad part could be crossed with safety. Two gears and a free engine meet all requirements out here, as sidecars are kept for station use, where one can get pacca (metalled) roads.

I am now going to make a suggestion which, to my way of thinking, is more important to us than any specially designed machine. If one of the dealers would make out a catalogue of prices of all the machines, showing the price he wants for the machine landed free on rail at Karachee, Bombay, Madras, and Calcutta, he would make his fortune. As we stand at present, I am willing to stake anything that there is not one in a hundred persons who knows what charges a motor bicycle is subjected to on its way out. The result is that he is haunted by the fear that he does not know to what extent he will be involved by the time the machine reaches him. If a catalogue of inclusive prices were issued, all one would have to do would be to add the railway freight to the catalogue price. But let there be no extras after the machine has arrived. Spare parts should also be priced in the catalogue.

Sargodha, Punjab, India. P 591.

The Motor Cycle in Mauritius.

Sir,—There are a great many motor cars and motor cycles out here and the numbers are increasing, the total being about 500 (cars and motor cycles, I do not know the separate figures), which is large for so small a colony, but is accounted for to a great exent by the "Surra," a disease which attacks horses. This became so serious a few years ago that the sugar planters raised a loan from the Government to enable them to replace horse traction on the estates by light railways; these are now installed all over the island. At social functions, such as the races, dances, etc., quite a common sight is a stream of motor vehicles with perhaps one or two horse-drawn carriages, the proportion of the latter being far smaller than at home.

With regard to motor cycles, F.N. 2½ h.p. machines long held the field, but are being ousted by English machines, of which the Phelon and Moore 3½ h.p. is by far the most popular. My machine is an F.N. four-cylinder, of which kind there is one other in the island. At present the French-Mauritians swear by P. and M., but probably any good English maker, who could supply a no-trouble machine, could become equally popular. The roads here are poor and play havoc with tyres. They are not gritty, nor so stony as one experiences in other Colonies, but the road metal, of volcanic rock, wears away the treads of the tyres in an unexpected way. Perhaps also the moist and hot climate affects tyres generally. P. E. MARR.

Port Louis, Mauritius.

A Lady's Choice.

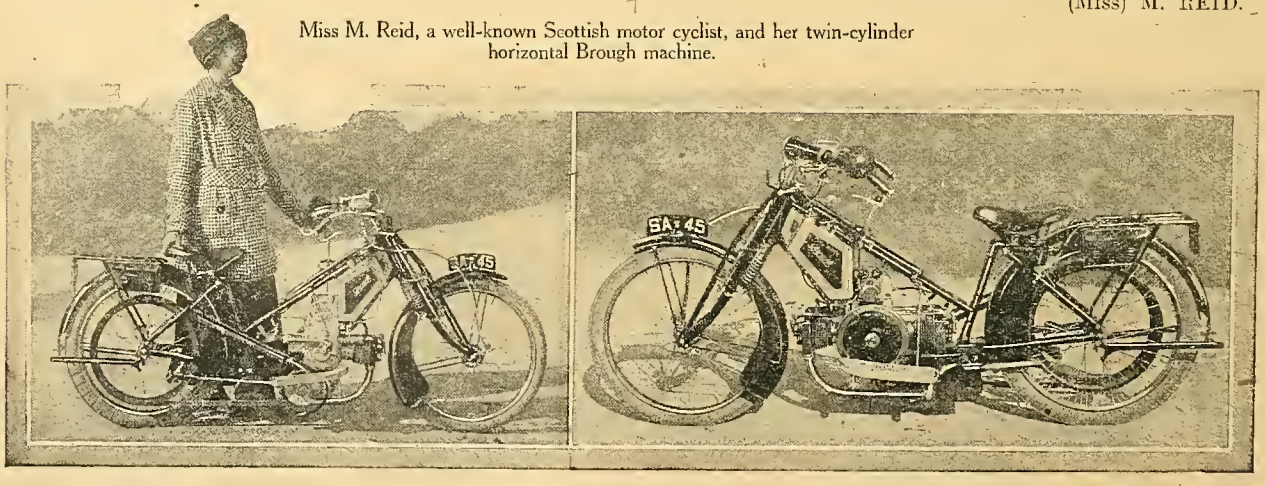
Sir,—I have read the article dealing with ladies and lightweights in a recent issue of *The Motor Cycle*. While some prefer a lightweight, I prefer a machine of medium weight and plenty of power. This year my choice fell on a 3½ h.p. horizontally opposed twin Brough, with two-speed engine box.

From the enclosed photographs you will see that it is a perfect lady's model. It is a beautiful machine, and runs very sweetly. The engine is capable of 60 m.p.h., and hills never trouble it.

The smooth drive of this twin is far ahead of any machine I have ever ridden. I advocate a horizontal twin in preference to any engine made, and those who have had experience of this machine will endorse my remarks.

(Miss) M. REID.

Miss M. Reid, a well-known Scottish motor cyclist, and her twin-cylinder horizontal Brough machine.



British Motor Cycles in Germany.

Sir,—Referring to your issue of the 9th July *re* "British Motor Cycles in Germany," I may say that I fully endorse in every respect Mr. Cap's views upon this subject. I have quite recently taken over the sole agency for Germany for Williamson, N.U.T. motor cycles, and the Derwent sidecars, and judging from the number of enquiries received it seems as if the business is going to be a success. The Germans seem to realise that English machines have no superiors in the world as far as construction, reliability, and appearance are concerned, and I must say that German makes are nowhere near "good old" English lines.

There is also an increasing demand for a good lightweight.

Frankfurt am Main. ALBERT A. CRESSELL.

Age Limits for Accident Insurance.

Sir,—In your last week's issue I notice a letter signed "Medicus" complaining of the fact that, owing to his age, which is apparently between that of sixty and sixty-five, he was unable to obtain a personal accident insurance for himself whilst riding a motor cycle, mentioning in particular the Motor Union Insurance Co. as being the office where it was absolutely declined to take this risk on.

I notice your correspondent adopts the *nom de plume* of "Medicus," but I should be rather inclined to think that he has ill-chosen this *nom de plume*, as if he had any medical knowledge at all he would, of course, know that there must be a greater risk in the case of an accident of the injuries resulting fatally to a man of sixty-five years of age than to a youth of sixteen or seventeen.

I believe all insurance companies issue their policies on the assumption that their assureds are perfectly capable of driving their particular machines, and it is not on the score that the man of sixty-five is not able to drive that they refuse to accept his personal accident risk, but it is simply that, should he break any bones, it is certainly more serious than it is for a younger man. It seems to be a foregone conclusion by men of the same character as "Medicus" that insurance companies are purely philanthropic institutions, but, so far as my dealings with them are concerned, I have always found them purely straightforward business concerns, provided that one deals with them on the same lines. U 1315.

Some Criticisms on Sidecar Design

Sir,—I see that you are now making your annual reference in reporting the Scottish and English Six Days Trials to the usual crop of broken sidecar frames and couplings. It is a most surprising thing that, with motor cycle engineering at its present high level, the design of the modern sidecar should be such a haphazard business.

Of course, there are notable exceptions; but really the majority of luxurious and heavy sidecars on the road to-day are irretrievably bad in design. There are two great lines of error on which designers work—one is to undersling (as they call it: it is not true underslinging) the chassis. The other is the piling up of weight forward of the axle.

On motor car, the ground clearance being limited and stability being all essential, any attempt at cutting down wind resistance must result in a low design. But this does not hold good with the sidecar. The wind resistance depends on the surface presented to the wind, not upon the height of the body from the ground, and the stability is quite sufficiently obtained by widening the track to counteract the lifting tendency on left-hand corners. Moreover, on these ultra-low seated sidecars the passenger, unless very fully screened, sits in a perpetual shower-bath of mud, grit, and tar, while conversation is out of the question owing to the great distance between the heads of driver and passenger.

When the sidecar first appeared it was greeted with a storm of hostility, and broken frames were freely prophesied. But the strange part was that frames did not break then so much as they do now. The reason is easy to see. Increased weight has something to do with it certainly; but the best proof is this: Take off the near side front wheel of a motor car and try to make a good three-wheeled vehicle of what is left. It is impossible until you shift the centre of gravity backwards and enable the unsupported corner to maintain its normal level. The modern sidecar is little better than the impossible vehicle described above. So long as the passenger sat with all, or almost all, his weight over the sidecar axle the vehicle was a sound one, but as soon as elaborate, modern requirements and long, heavy bodies made this inconvenient, we got a lop-sided and top-heavy affair which is bound to put an unfair strain on its connections and the front of the machine.

There is no need for these incorrect designs. It is possible to fit a really comfortable semi-recumbent coach-built body on a plain chassis (witness the Rover) and carry the passenger's weight almost entirely on the axle without spoiling the appearance or the stability of the construction. It is to be hoped that makers will not bring about the demise of the sidecar by over-elaboration at the expense of sound design and thus repeat the history of the tandem-seated tricars. B. C. DE W. SIFFKEN, B.A., CANTAB.

Unnecessary Horn Blowing.

Sir,—The reasonable letter in your issue of July 30th by "Daimler" prompts me to write you on a kindred subject.

One of the Christadelphian ecclesias here in Birmingham is unfortunately situated next to Gough Street, well known as Birmingham's test hill. It is quite a usual occurrence for thoughtless motor cyclists to disturb the worshippers in the hall by continually endeavouring to ascend Gough Street. On a recent Sunday a rider of a big twin made several attempts in succession, failing in about six instances to get up. These abortive efforts were accompanied by frequent roaring of the engine when the gears were changed or the engine freed. Perhaps a word in your valuable journal would put a stop to the nuisance.

H. W. WARRE.

Colonial Requirements.

Sir,—As a two years' reader of *The Motor Cycle*, I have been much interested in the opinions of your Overseas readers as to the desirable qualities of a Colonial machine. I have just read the letter of Mr. L. E. Stuart William in your edition of May 28th, and am surprised to see that, like many others, he prefers a plated finish to the more workmanlike all-black. It is a curious argument, too, to say that "the rains in India last only a couple of months, and then only for a couple of days at a time in the plains." This is wildly inaccurate. India, of course, comprises many climates, and in Sylhet, where I have lived for the past eight years, we have few dry days between March and November. On one tea garden where I was stationed I have seen two months without a dry day, and with a rainfall for that time of over 100 inches, while there is at least one Sylhet tea garden with an average of over 250 inches per annum, while Chessapunji, not far from here, holds the world's record for rain. One day in June last the gauge there gave 31 inches in a day, but the record is 41. So much for rain in some parts of India.

If I were designing a machine for use here without a sidecar—few of our roads are fit for these, though in Assam it is another matter—the specification would be about as follows:

Engine.—350 c.c., air-cooled, two-stroke if petrol economy is not essential; this for simplicity, as the nearest garages or repair shops are in Calcutta, and we count ourselves lucky to get a repair job done inside a couple of months.

Tank.—Two gallons.

Tyres.—2½in. at least.

Gears.—Two-speed gear box. Three-speed hubs give trouble, and are not easy to repair.

Wheels.—Roman rims. My rims, of ordinary make, are badly dented. Spokes extra heavy.

Clearance.—Not less than 6in.: more if possible.

Finish.—All black. We planters can get a coolie to clean off mud and dust, but people in towns are not so fortunate.

Mudguards.—Big clearance. When you run into a bit of "ponk" it is usually necessary to scrape chunks of mud out of guards, front brake, etc., which is not a nice job when the temperature is over 100°. PLANTER.

Sylhet, Assam, India.

SUMMARY OF CORRESPONDENCE.

Messrs. Phelon and Moore write: "In our announcements in connection with the Scottish Trial we stated that the P. and M. was the only make of which there were more than four entries and every entrant received an award. We find, however, that there were seven Clynos entered which gained seven awards, and we shall therefore be glad if you will, in fairness to the Clyno Company, publish this letter."

RACING AT ST. ANDREWS.

Leven and East of Fife M.C.C. hold a Successful Meeting on the Sands.

ON Thursday last this club held their annual races on the sands at St. Andrews. A representative entry had been received by the secretary, Mr. A. J. Carlow, and although none of the English cracks were present, the only notable Scottish absentee was A. H. Alexander, who was unable to compete owing to pressure of business.

The programme contained sixteen classes, and although one or two of these were sparsely filled, the racing was keen and exciting. In Class 1 (open), for machines up to 350 c.c., A. B. Watson (2¾ N.U.T.) and D. S. Alexander (2¾ Enfield) were the only starters. The distance was ten miles, and the former, early taking the lead, won in 13m. 27s.

Class 2 (open), for machines having engines up to 560 c.c., was much better supported, and consequently resulted in a keen struggle. J. W. Adamson (3½ Triumph) took the lead at the start, and maintained it for a few laps, but O. G. Braid (3½ Norton), who was at the leader's back wheel, finding an extra ounce of speed, went to the front and won by several yards, his time for the ten miles being 12m. 34s. J. W. Adamson (3½ Triumph) was second, and J. Christie (3½ Triumph) third.

Big American Twin's Struggle.

Class 3, open for machines having engines up to 1,000 c.c., the distance being approximately ten miles, was productive of a great surprise. At the start the 7-9 Harley-Davidson, ridden by C. Armstrong, showed splendid acceleration, and before a quarter of a mile had been covered was leading the field. Gradually drawing away from the other competitors, it was leading by threequarters of a mile at the end of the eight miles. A faulty plug, however, gave trouble at this point, and it finished on one cylinder. Even then it managed to secure second place, first position going to G. L. Sawer (7-9 Indian), while A. J. Carlow (7 Zenith) was third. The winner's time was 11m. 59s. W. Lawrence (7-9 Indian) was unfortunate enough to break the driving chain during the afternoon no fewer than four times.

Class 4 (expert barred), for machines having engines up to 350 c.c., provided A. B. Watson (2¾ N.U.T.) with his second win, J. R. Duncan (2¾ Douglas) being second, the time for six miles being 9m. 4s. Particularly hot machines were the Nortons ridden by the brothers Braid, three of whom were present, and in Class 5 (expert barred), for machines up to 560 c.c., H. W. Braid easily secured first place, with A. B. Watson (2¾ N.U.T.) second, the time being 7m. 32s.

Class 6 (expert barred), for machines up to 1,000 c.c., gave Armstrong (7-9 Harley-Davidson) a winning ride, and Class 7 (open), a one mile race for machines up to 350 c.c., was won by A. B. Watson (2¾ N.U.T.).

Class 8 (open), one mile, for machines up to 560 c.c., went to O. G. Braid (3½ Norton), with A. J. C. Lindsay (3½ Rover) second, and J. R. Alexander (7-9 Indian) secured Class 9, one mile, for machines up to 1,000 c.c.

Class 10 (expert barred), for machines up to 350 c.c., one mile, was won by Watson on a N.U.T., with J. R. Duncan (2¾ Douglas) second.

H. W. Braid (3½ Norton) won the expert barred mile event for machines up to 560 c.c., A. B. Watson (2¾ N.U.T.) being second, and P. Grosset (3½ Ivy) third.

Class 12 (expert barred), for machines up to 1,000 c.c.—P. Grosset (7 Zenith) won, and G. L. Sawer (7-9 Indian) was second.

Class 13, for machines up to 1,000 c.c., ridden and owned by amateur non-experts permanently resident in the county of Fife.—H. W. Braid (3½ Norton) first, W. Turnbull (7 Indian) second, and P. Grosset (3½ Ivy) third.

The Sidecar Events.

Class 14, for motor cycles and sidecars with engines up to 600 c.c., provided interesting racing. The distance was approximately four miles, and at the start R. D. Somerville (3½ Rover sc.) took the lead. This he maintained until within half a mile of the finish, when a shorting plug pulled him up and let up J. Christie (3½ Triumph sc.), with H. G. Lawson (3½ Premier sc.) close up.

A. J Carlow (7 Zenith sc.) won the 1,000 c.c. sidecar class, the other competitor, W. Lawrence (7-9 Indian sc.) breaking a chain.

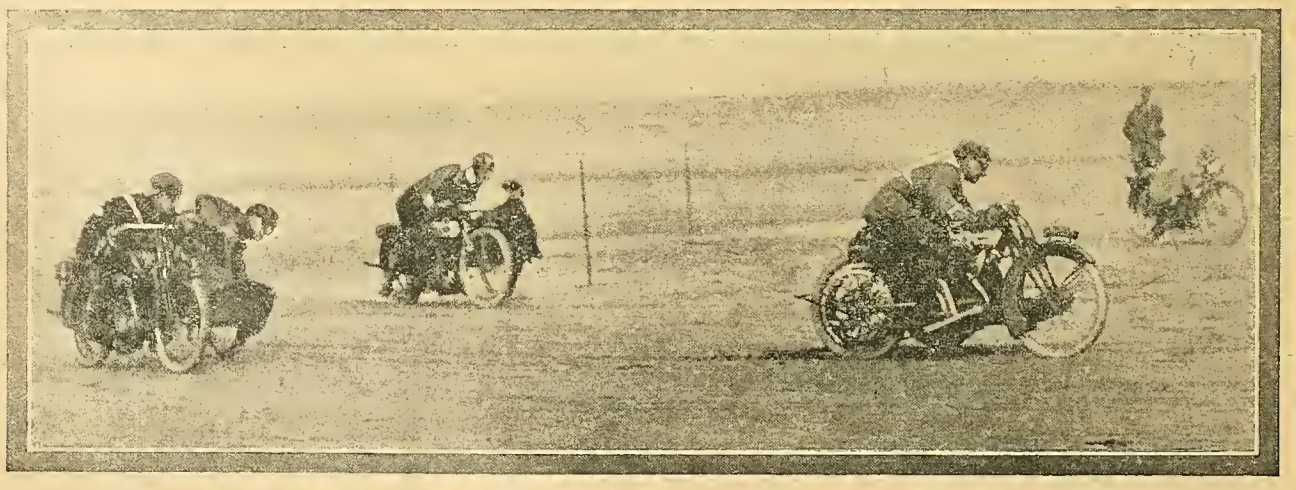
Class 16 (expert barred), for sidecars up to 600 c.c., distance two miles, was won by J. Christie (3½ Triumph), with R. D. Somerville (3½ Rover) second, and H. G. Lawson (3½ Premier) third. This finish was one of the best of the day, a few yards covering the three riders.

As a wind-up, an open invitation race was held, the distance being approximately four miles. Right from the start Armstrong (7-9 Harley-Davidson) took the lead, and finished well ahead of the second man, A. J. Carlow (7 Zenith).

COMPETITIONS IN THE COLONIES.

A reliability trial has recently been decided in New Zealand, in the shape of an open trial for sidecar combinations over an extremely difficult course of 140 miles. Strange as it may sound, heavy snow was encountered, which naturally added greatly to the difficulties. G. B Brown and J. H. Michael, both riding Triumphs, registered non-stop runs, and the team prize was also won by Triumph riders, with a total of 783 marks, which won them this prize by over fifty points.

Great interest was displayed at a race meeting lately decided at Bloemfontein by the Orange Free State A.C. The chief event was the fifty miles race for the Continental Trophy. The actual distance was said to have been just over fifty-two miles, and the winner was W. Campbell, riding a T.T. 3½ Triumph, his time being 56m. 56s., which beats the South African record for the distance, L. A. Howie (3½ Triumph) second, and E. Hoehne on a similar make of machine being third.



R. D. Somerville (3½ h.p. Rover sidecar) leading Premier and Triumph machines at the turning point in the four mile sidecar event

A DASH ACROSS FRANCE.

Exciting Adventures which befell "The Motor Cycle" Representatives on the way home from Grenoble.

THE representatives of *The Motor Cycle* who went over to France last week in connection with the International Six Days Trial had a most interesting if not exciting trip. A start was made from Havre last Thursday morning in company with Mr. and Mrs. Loughborough and Rev. E. P. Greenhill. Three competitors, in W. B. Little (Premier), Frank May (A.J.S.), and J. Greenwood (Connaught), followed the pilot car, which contained five persons. At that time the situation had not assumed the seriousness it now has, and none imagined that the trial would be postponed.

It so happens, however, that the event was cried off the same day the party started across France by road, but the stopping places not having been fixed beforehand, wires failed to intercept the party. A fast pace was set up, and May had engine trouble at Romancourt and elected to train to Paris for repairs.

Near Gien on the second day, H. F. S. Morgan, who had started the day previously, was met returning, he having been troubled with a main bearing bush on his engine.

The Trial Abandoned.

The car and the two motor cyclists managed to lose one another, but all arrived at Grenoble safely last Saturday evening and learned with the greatest concern that a general mobilisation of the French Army had been ordered an hour previously, that the trial was abandoned, that petrol had been commandeered by the French Government, and that foreigners must quit within twenty-four hours. Here was a serious state of affairs!

The car party at once decided to return at the earliest possible moment. There were no trains available, and on Sunday morning the British Consulate was visited. Here we found a number of other competitors and their passengers making enquiries as to the best course. All were advised to leave as quickly as possible, and the British Consul gave it as his opinion that *essence* would be obtainable in the villages. This news led Pressland (Crouch Carette) and W. Chater Lea (Chater-Lea) and their passengers to discuss a return *via* the Galibier Pass in order to enjoy some of the gorgeous scenery of the French Alps. What became of them we do not know.

Finn and his passenger with the Enfield sidecar had managed to lay in a store of petrol and intended returning by road. R. A. Bishop with the 8 h.p. Enfield sidecar which Greaves drove in the English Six Days Trial seemed undecided what to do, though he had journeyed down by train. Little and Greenwood elected to return by the route they had traversed.

Petrol Obtainable at Last!

By dint of diligent enquiries a source of petrol supply was privately forthcoming, and our party therefore took on board some fourteen bidons. There was naturally great excitement in Grenoble, and a military air on all sides. Only a few trains were running to certain restricted spots, and weeping women and children bidding good-bye to their menfolk made matters look ominously black.

A start was made on Sunday morning on the 500 mile trip to Havre, the party having decided not to lose a moment. Railway crossings, of which there are a large number in France, as well as the bridges, were guarded by gendarmes, and the car was pulled up on many occasions and the occupants interrogated as to their nationality and as to the nature of the baggage, the presence of explosives being feared. We had taken the precaution to display the emblems of the *Entente Cordiale* on the car and many times they were recognised and enthusiastically cheered.

The increased vigilance of the authorities, however, impressed upon the party the extremely serious nature of their position, and the probability of being cut off in France should the Channel service be stopped, which it was anticipated would be the case.

A Dash through the Night.

At Decize, where the party dined, it was resolved to continue throughout the night by changing drivers and relying upon the Michelin Guide and Baedeker for the route. Splendid progress was made, and, curious to relate, during the night only once was the party challenged by a sentry. As dawn broke cart loads of reservists from the country were encountered on their way to the mobilising centres, and twenty-four hours after the start the distance recorded was 415 miles. But our petrol supply was now becoming exhausted, and many times our requests for replenishments were met with a shake of the head. At Dreux, however, our luck was in, and once again we laid in a good store. How thankful we were that the French roads were so straight! Speed was quickened as daylight improved, but now another trouble threatened the party, which, of course, was absolutely reliant upon the car to see them safely through. It was feared that the ferry across the Loire at Quillebeuf would be suspended, which fear was later discovered to be a well timed one, and the route consequently changed to the longer stage *via* Evreux and Rouen.

Occasionally we were able to pick up scraps of war news, but the alarmist reports were in the main proved later to be unfounded, but they served to increase our determination to go through to Havre to avoid risk. The sentries were not so much in evidence as the frontier was left behind, but the military preparations were by no means relaxed. Havre came in sight at last after twenty-seven hours' continuous running.

It was generally believed that Wednesday night's boat would be the last across for some time, and, consequently, we fear that the remainder of the British party may be subjected to great inconvenience, as nothing had been heard of them when we left Havre.

The boat on which the writer sailed was stopped in the Channel on Wednesday morning while a torpedo boat encircled her; a pilot was taken aboard off Southsea to navigate the boat by a roundabout route (it was said and believed to avoid the mines), and after many delays in the Customs at Southampton, the train due at Waterloo at 9 a.m. got there at 3 p.m., and there was not a single traveller who was not heartily glad to set foot on English soil again.

THE AUTO CYCLE UNION.

Six Days Trials, July 6th to 11th, 1914. The Judges' Report.

Machines.

The judges would particularly like to comment upon the performances of the different types of machines. Taken all round, most solo mounts were capable of doing practically everything required of them, and varied only in their comfort and reliability. The performance of the 4 h.p. Triumph ridden by Mr. W. Westwood may be noted as particularly fine, while the Blackburne machines are also worthy of very favourable notice on account of their good engine design. The Douglas team accomplished an excellent performance. The sidecar machines failed to put up as good a performance as usual, largely on account of the fact that, with the exception of the Clyno in particular, no machine appeared to have been designed as a unit. In nearly every other make the frame was designed so that either too great a proportion of the load was taken on the front connection or else the sidecar axle was bent to every possible shape without any attempt whatsoever at staying except of a very crude nature, which staying appears to have been added as an afterthought, and which, owing to the frictionless nature of the fastening, provided small additional strength. A frame should be triangulated as far as possible, and designed with as little shear as possible on the joints. The Matchless sidecar frame is an example of correct staying of axle, though even this machine does not fully carry out the principle of triangulation, and the very rigidity of the frame as built was probably a source of weakness, as was exemplified in the case of competitor No. 69 (G. Hardee, 8 h.p. Matchless sc.). The vertical moment of inertia taken on some of the frames is ridiculously small, with the result that the stresses thrown on the frame are out of all proportion to the load, but here again the Clyno was an exception. The practice of carrying a can of petrol entirely unsprung and near the driving wheel is bad, as it leads to severe shock where it is entirely unsprung.

Cycle Cars.

The cycle cars showed great improvement, as they are admittedly less suitable for the routes traversed than motor bicycles. At the same time, however, sufficient attention has not been given to the design of the axles, which, in some cases, either bent or else wore badly. The underslinging of frames would improve the steadiness of many machines, as would proper axle staying; the Gordon cycle car was bad in this respect, and had only about two inches bearing surface on the steering heads to take the whole side load. The performance of the Calthorpe was excellent, and the judges would also like to draw attention to the J.B.S., which finished in excellent order. It would appear to be a good example of the cheaper form of machine. As far as transmission is concerned, the Gordon cycle car is comparable in efficiency to many of the sidecars, and probably scores heavily in this respect. More steering lock should be provided on cycle cars.

Frames.

There is still far too much guesswork in the design of this vital part; the frames of sidecars have already received comment, and are bad almost without exception. Frames of motor cycles are also poor in many cases, and are only able to stand up to the work on account of their size and weight. The judges are surprised that more use is not made of steel and aluminium compounds and steel pressings in frames. They would particularly draw attention to the steering head. At this point many machines have bends and curves so designed as to practically double the forces tending to shear the tubes, and, incidentally, causing vibration which has a bad effect on the wear of the head bearings. Many of these bearings were very slack after the trial; they should be provided with greasers and larger bearing surfaces, so arranged as to each take an equal share of the thrust. The Lea-Francis was an example of sound design in the latter particular.

It is interesting to note what an excellent effect on the comfort and running of a machine is obtainable by a properly balanced open frame such as is fitted to the Scott. The Scott machine performed excellently and gave one a greater impression of unit efficiency than any other machine. The frame was well designed, and the judges would draw attention to the possibilities of the open frame considered from the girder point of view, such as might be obtained by the use of a one-piece pressing. In such a case, the bottom of the frame would shield the whole of the power unit. They would also draw the attention of designers to the value of straight tubes and longer and, in the case of sidecar machines, heavier tube sockets. It was noticed that it was the exception to find the tube sockets tapered off in cross section towards their ends, which ends also should be serrated or wavy in plan to avoid local intensity of stress. The method of dipping the whole frame of a machine is greatly preferable to end brazing, which not unfrequently weakens frames so that after a few months' running they take up a permanent set to the detriment of almost every part. In several instances frames might easily be strengthened by such fittings as large silencers, which might also act as mud shields, as in the Lea-Francis, and yet clear the ground sufficiently to avoid any ordinary road surface.

Power Units.

In constructing the power unit of a motor cycle, it is not sufficient merely to obtain power, it is extremely important that the engine should be silent in itself as distinguished from the noise of the exhaust, and as conducing to this result, it should be clean and free from vibration; such silence is the best evidence of good design and workmanship. Most engines were not in any way flexible, and consequently to allow for this defect they were more powerful than was really necessary, with the result that they were capable of turning at high speeds, which under most conditions causes not only discomfort to the rider, but also unnecessary wear and shock on the various portions of the frame and transmission. It is desirable to construct the power unit to give not only a smooth torque, but in such a manner that it can be conveniently enclosed and made free from rattle, whilst maintaining a reasonable amount of power at low speeds. The Scott engine was a good example of care in this direction, but its silencing apparatus was not so good as might be wished for.

The two-stroke machines generally were altogether creditable.

Proper means for lubricating every part (under slight pressure if necessary) should find a place in almost every machine.

Brakes.

Practically every machine which got through the trial was fitted with fairly good brakes, although they were in many cases weakly attached and fitted with too small a surface and too little leverage or means for adjustment. It is very important that brake rods should not be unduly bent out of the straight, and in the case of front wheel brakes, they should be more heavily anchored at the forks, for otherwise they are almost useless and better omitted or applied to the rear wheel. The Lea-Francis was the best example of front brake design. It is desirable that compensating sidecar brakes should be used on heavy outfits, and these are preferably operated by rods in place of wires. The internal expanding type of brake is equally effective forwards or backwards, and gives no trouble. Some method of holding a machine from running backwards or forwards on a hill without the driver leaving the gear in engagement is also desirable, and a small ratchet is not difficult to fit to a hand brake. Few brakes were effective in holding machines backwards, as was shown in the restarting test, neither are the springs fitted to pull off the brakes up to their work, with the exception of the P. and M., Blackburne, and one or two other makes.

Forks and Springing.

Although the bad roads may account for a good deal of the trouble, that fact was insufficient excuse for the number of front fork springs found broken at the end of the trial. There is no need for there to be excessive side play in any of these designs, and the use of spring washers allowing side play of the links is distinctly bad. The link pins should be fitted with greasers as in the Matchless machines, and the use of leaf springs or other shock-absorbing device in place of coil springs might well receive attention. In the opinion

of the judges it is a matter of comment that there were not any machines sprung both front and rear. Especially in the case of the large sidecar outfits, it appears somewhat extraordinary to spring the seat of the sidecar only and to leave the whole outfit at the mercy of every road shock. The whole chassis should be constructed as a unit and sprung as independently as is possible. A one-inch spring motion would be sufficient to prevent frame damage on the worst roads.

Rims and Wheels.

On the rough roads encountered in the trial it is natural that there should be some damage done, but most rims were too weak. It is not entirely desirable to fit absolutely rigid wheels on a light motor cycle or sidecar, but it is desirable that the rims should be stiff. The Clyno, P. and M., and Premier suffered no damage in this respect, but many others were injured.

Detachable wheels are desirable, especially on passenger machines, and although introduced by one or two makers some time ago, are being but slowly adopted by other firms.

As usual, tyres were the cause of many marks being lost. Large section tyres were generally fitted, especially on the passenger machines, and their adoption undoubtedly tends to personal comfort, and to the saving of the machine itself. The very loose stony surfaces on the many steep gradients were a severe test of tyres, and they appeared to have stood it well in general. The element of luck cannot be entirely eliminated, but the use of as large section tyres as reasonably possible will go far towards neutralising it. There was a tendency to undertyre some "lightweight" machines.

Mudguarding.

Taken all round, the mudguarding on the machines showed a much needed improvement, but a combination of oil and dust was found covering many parts at the conclusion of the trial. It is important that the mudguards should project widely beyond the wheels, and also should be arranged so that they can be swung out of position. It is an advantage slightly to lip the edges to avoid mud-throwing. Practically no machine, except the Scott, the Lea-Francis, and one A.J.S. had anything in the nature of an undershield. Both engine and gear box should be properly protected by means of a long undershield, and this undershield might well form part of the main cradle.

Gear Boxes.

The judges were pleased to notice that on one Ariel a proper gate change was fitted, giving four forward speeds; this is a very desirable feature and might be copied with advantage. It should at the same time be remembered that a gear box is merely an excuse for an unsuitable engine, and for ordinary touring work the value of a flexible power unit must not be forgotten. It is doubtful whether any infinitely variable gear would have been so successful on some of the worst hills, but it would probably have provided greater comfort, and there is room for improvement in this direction and for novelties in design, such as variable tooth or worm drives all totally enclosed.

Sidecars.

The bodies of most sidecars were comfortable and suitable for touring, although the upholstering of most was very poor in quality. The use of real leather instead of the many imitations generally employed is most desirable, and the additional cost should be trifling. Nearly every chassis except the Chater-Lea, Matchless, and Clyno was greatly lacking in vertical girder strengths, so that, as already announced, if machines did not break they usually distorted badly. A sidecar attachment should not be looked upon as being capable of taking lead in more than one direction, and more attention to this point is very desirable. There were a number of cases of sidecar body suspension springs fracturing, and this is largely due to the frames being unsprung. If a machine is designed for easy suspension on ordinary roads the damping effect of a keyed leaf spring or shock absorber is desirable.

Controls.

In most cases carburetter controls were in a satisfactory condition, as were gears and their operating rods, but more attention should be given to the provision of hand-controlled clutches, two good examples being those on the Ariel and small Clyno machines. The same remarks apply to shock absorbers, which are very desirable fitments as apart from the ordinary slipping clutch. The Enfield shock absorber is good and thoroughly well protected. A few Bowden magneto controls were totally inoperative, and others were stiff. These fitments should be better protected or the contact breaker operated directly as on the Matchless machines.

Stands and Kick-starters.

A small number of machines were fitted with front wheel stands, but they should be standard on every machine. The stands on the lightweights were far too flimsy, and bent when the rider's weight was put on them. Many were not fitted with a suitable nut screw and spring catch, or other device, to positively retain them in position when out of action.

With a few exceptions, the machines fitted with kick-starters appeared to finish with this fitment in good condition, which is a very marked improvement over former years; some kick-starters were placed too far to the rear of the machine.

Brake Tests.

The brake test was instituted for the purpose of obtaining a comparative result, and as a measure of the deceleration of the machines. Competitors did not appear to realise that it is desirable to travel at a good speed when testing brakes, for when a wheel becomes locked the braking value falls off, and in most cases a bad performance was due to non-observance of the regulations rather than to inefficiency of brakes.

Accessories.

Accessories fitted in this trial were on the whole very satisfactory, and makers seem to have realised the nature of the stresses imposed, although there is still a good deal to be learnt as regards attachments, which, though strong, are often so situated that the load comes otherwise than in a straight line through the holding-on bolts. This can only result in crystallisation and fracture of the lugs.

The free use of insulating tape to secure fittings on many machines clearly shows that much is still lacking in their design. This should be unnecessary

General Remarks.

With very few exceptions indeed, machines could be started quickly and easily, a great advance on previous years. Practically no marks were lost by reason of machines not being ready to start to time each morning.

The judges are of the opinion that the showing made by every machine to finish was distinctly good, the cycle cars put up a fine performance, and particular credit is due to the Calthorpe and J.B.S. machines. In the motor cycles, the P. and M., Sunbeam, Scott, Bat, Douglas, and Blackburne were extremely good, whilst the performance of the O.K. and Baby Clyno motor cycles is deserving of very special mention. Of the sidecar machines the Chater-Lea, Matchless, and Clyno were almost equally deserving of credit. The latter make was perhaps the neatest in lay-out and strongest weight for weight, but its mechanism was less accessible.

The driving throughout the trial was good, and the competitors endeavoured to keep up with the spirit of the regulations in almost every instance, although they did not appear to grasp the principle of the marking, which was that a 100% performance should have been, and was the exception, and that different types of machines were expected to lose marks proportionately, the minima of marks to gain awards having been graded accordingly for each type.

The judges are of opinion that the concessions made to the competitors were extremely free, and as regards the conditions of the machines at finish, they had advised the stewards very strongly that all machines completing the course with severely injured parts or frames should have had practically the whole of their reliability marks for condition deducted. This is a point which they would strongly uphold in future trials, as it is absurd to have machines constructed with such refinements as lighting dynamos (which, by the way, should not be placed so as to weaken the frame), and then to find that the whole chassis is wrongly designed and incapable of withstanding shock.

The performances of the 3½ h.p. Premier with sidecar that completed the trial, and of the small Dayton machines, are both worthy of favourable mention as indicating the possibilities of the comparatively small powered machine.

In Wireless Touch all Day.

Not long ago *The Motor Cycle* published first-hand particulars of a wireless installation that one of its readers had fitted to a motor cycle. Now we learn that a motor delivery company in town, the "State Express," have fitted one of their delivery vans with a transmitting set, by means of which they can send urgent messages to their head office in Finsbury from a radius of twenty-five miles.

A.A. and M.U. Notes.

TWYFORD HILL BRIDGE : ROAD OPEN.—The A.A. has been informed by the district surveyor that the road leading to Twyford Hill Bridge (Herts) is reopened to traffic, the old bridge having been taken out and a strong temporary structure put in its place.

SPECIAL WARNING TO MOTOR CYCLISTS.—The Automobile Association is informed that the Chief Constable of Lancashire has directed the county police to bring up all cases of motor cycles not having two independent brakes.

International Trials Postponed.

Owing to the regrettable commencement of hostilities on the Continent, which threaten to involve a great part of Europe in war, the F.I.C.M. trials, which were to have taken place with Grenoble as centre, have been postponed.

How to Grind in Valves!

In an Australian paper the advice is given to grind in valves with a mixture of graphite and oil. The correspondent who sends us the paper would be glad to know how long this would take.

Racing at Brooklands.

The B.M.C.R.C. will hold their fifth monthly meeting at Brooklands on Saturday, August 22nd. The following is the programme of events :

Event 1.—2 p.m. The one hour cycle car race. For cycle cars and light cars eligible for the coming international race in the Isle of Man for the Dangerfield Trophy.

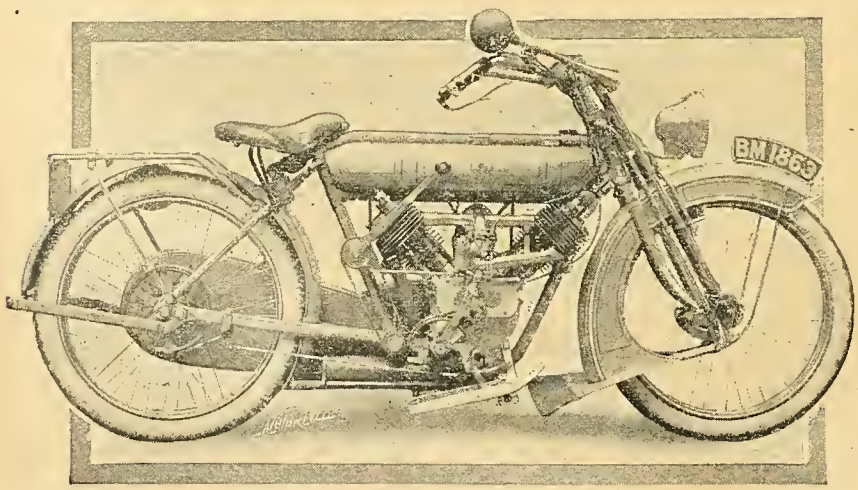
Event 2.—The 350 c.c. three-lap scratch race.

Event 3.—The 500 c.c. three-lap scratch race.

Event 4.—The 1,000 c.c. three-lap scratch race.

Event 5.—The 500 c.c. (with sidecar) three-lap scratch race.

Event 6.—The 1,000 c.c. (with sidecar) three-lap scratch race.



Valve side of the twin P. & M., showing kick-starter gear operating mechanism, footboards, and carburetter with hot-air intake. (See description, issue of July 23rd.)

SPECIAL FEATURES.

DESIGN OF MILITARY MOTOR CYCLES.
SIDECAR CHASSIS DESIGN.
JUDGES' REPORT OF A.C.U. SIX DAYS TRIALS.

Events 2 to 6 are open only to members who have not won a first prize at a B.M.C.R.C. meeting during the years 1913 and 1914.

Entries close first post Saturday, August 15th.

Continental Tours during War Time.

Motorists intending to tour on the Continent with their cars are strongly advised to obtain the latest information from the head office of the A.A. and M.U., Fanum House, Whitcomb Street, London, W.C., before arranging for shipment. It should not be forgotten that in the unhappy event of a state of war obtaining in the country visited, there is a grave risk of automobiles and motor cycles being commandeered for military purposes.

The Levis and the "Breakdown."

Riders of the two-stroke Levis commonly start by the somewhat unusual procedure of throwing both throttle and air wide open, and this peculiarity—evidently unknown to those responsible for detuning machines for the Breakdown trial—resulted in an amusing episode at the recent gymkhana of the Preston M.C.C. The Levis exponent, rushing up to his machine, immediately "spotted" that his h.t. wire was disconnected at the "mag," and after remedying this, opened wide his controls and ran.

To the surprise of the officials, the little two-stroke swept forward with marvellous acceleration, and racing to the finishing line, returned to the start as the second man pushed off. The puzzled rider was then accused of having received inside information, but protested warmly that no motor cyclist worthy of the name could fail to detect the disconnected wire. That, however, clamoured the disturbed officials, was not the "fault" referred to, and they proceeded to demonstrate that the carburetter slides were reversed, and to demand an explanation. Amid roars of laughter the winner complied with the request by throwing both levers wide open and starting his machine, explaining at the same time that it did not matter a "Continental" which opened which, so long as the slides gaped together.

War!

At the moment of writing it appears that motor cyclists may soon find opportunities to show that their favourite sport is more than a healthy and instructive hobby. They may be called upon in large numbers to put their knowledge, machines, and even lives at the disposal of the country. The equipment which has provided many a day's sport and many an evening's discussion will be at the free disposal of fellow countrymen. Let us trust that we shall be found useful if our services are required. The lives which many of us have often risked for sport and commerce in the past will be more readily offered in a sterner cause.

How to Act.

The Motor Cycle has entered into communication with the War Office with a view to furnishing the names and addresses of motor cyclists willing to serve as required. The War Office have gladly accepted such assistance, and if any readers are prepared to place themselves and their machines, or only the latter, at the disposal of the military authorities we shall be only too glad to forward any names sent in to us to the War Office. Readers desirous of helping should write us, on one side of the paper only, clearly stating their full names, addresses, and ages, also the horse-power, make, and date of manufacture of their machines, and whether they are prepared to give their services, or only those of the machines.

The Auto Cycle Union also call the attention of motor cyclists to the fact that any riders desirous of joining either for home defence or with an expeditionary force may obtain particulars of service from the nearest recruiting station.

On going to press we learn that the War Office are prepared to take twenty motor cyclists for special service. Preference will be given to those who know French and other foreign languages. Motor cycles will be taken over on valuation, or provided. The pay to commence with will be five shillings per day, all found. Service will be for one year or less, as the War Office may decide. Application should be made to Captain Trapmann, London Cyclists' Battalion, Fulham House, Putney Bridge.

FUTURE EVENTS.

—o—

Aug.	14-15.	Liverpool A C C Open Trial to London and Back.
"	15.	French Grand Prix Motor Cycle Race near Le Mans.

"	22	M C.R.C. Race Meeting.
"	22.	A C.U East Midland Centre Open Trial.
Sept.	6-9.	ANGLO-DUTCH TRIAL IN HOLLAND.
Nov	23-28.	Motor Cycle and Cycle Car Show at Olympia

International Cycle Car Race.

The following entries have been received by the Auto Cycle Union for the International Cycle Car Race, to be held in the Isle of Man on Wednesday, 24th September next.

H. Alexander (10 Calthorpe Minor).
A. Alexander (10 Calthorpe Minor).
F. Burgess (10 Calthorpe Minor).
T. V. West (10 Calthorpe Minor).
Trevor Ruscoe (10 Morris-Oxford).
Wm. Harris (8-10 Marlborough).
Gerald T. Mayne (10 Calthorpe Minor).
Vernon Busby (8 Morgan).
Marcel Violet (6 Violet-Bogey).
W. Douglas Hawkes (two 10 Victors).
J. M. Barrat (9 Tweenie).
Woodrow and Co. (two 10 Woodrows).
B. Haywood (10 Singer).
A. Lee Guinness (10 Singer).
E. L. Roberts (10 Singer).
G.N., Ltd. (10 G.N.).
E. B. McManus (12 Buckingham).
N. F. Holder (10 Merlin Blumfield).
E. C. Gordon England (10 Marlborough).
Henry Jones (8 Tweenie).
Morgan Motor Co. (two 8 Morgans).
F. H. B. Samuelson (10 Marlborough).
Maurice Leveque (8 Tweenie).
J. F. Buckingham (12 Buckingham).
Auto-Carriers (1914), Ltd. (three 10 A.C. s).
Lionel Martin (———).
P. J. Evans (10 Calthorpe Minor).

Entries at double fees, manufacturers and agents £30, others £20, will be received up to Tuesday, 11th August next.

British Machines Abroad.

About the middle of July the Allgemeiner Deutscher Automobile Club (A.D.A.C.) held a protest meeting in Eisenach, which proved to be the largest gathering of power-driven vehicles ever held in Germany. Over 2,200 cars and motor cycles registered at the various controls in the town. Among the English motor cycles present were four Douglas machines, two Rexes, two Royal Enfields, one Rudge Multi, and one Scott. Eight Indian machines were also counted. N.S.U.'s and Wanderers comprised the bulk of the German machines.

G. J. Eastburn, riding a 2¾ Douglas, was successful in gaining an award.

The A.C.U. Handbook.

We are informed that the A.C.U. for next year intends to augment the information contained in the official handbook, and over seventy additional pages (making over three hundred in all) of matter of use to motor cyclists on tour will be embodied in the new edition.

The Union is also preparing a separate handbook, which will contain matter relative to the control of the sport of motor cycling, and useful information as to how to run motor cycling competitions on the road, etc. This handbook will consist of about eighty pages of literature of the most useful nature to club secretaries and others interested in the promotion of competitions.

The Judges' Report of the A.C.U. Trials.

The judges' report of the recent Six Days Trials, which will be found on pages 194 and 195, is very interesting reading. Praise and blame are fairly apportioned, and in addition the report contains many useful hints which makers would do well to take to heart. Frames, including sidecar chassis, come in for a fair amount of criticism. Undoubtedly there is room for improvement here. A strong case is made out for the springing of the whole machine and excessive side play in spring forks condemned. The use of real leather for sidecar fittings is recommended.

The report concludes with a word or so of praise to those machines deserving of special mention

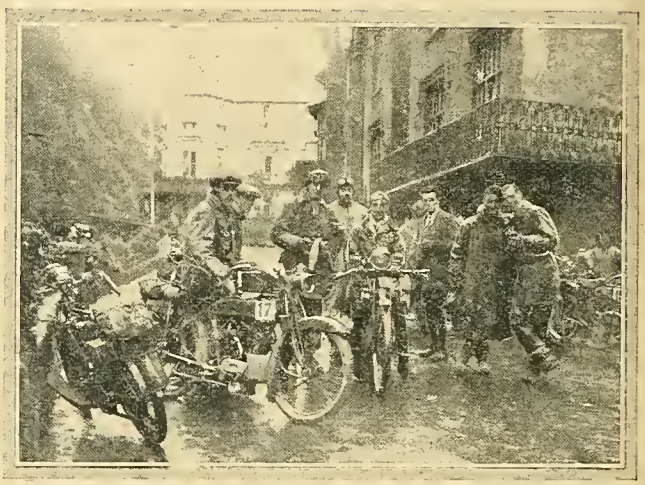
Lined up for the start of the invitation event at St. Andrews which was eventually won by C. Armstrong (7 h.p. Harley-Davidson).

HILL-CLIMBING TRIAL IN THE WEST.

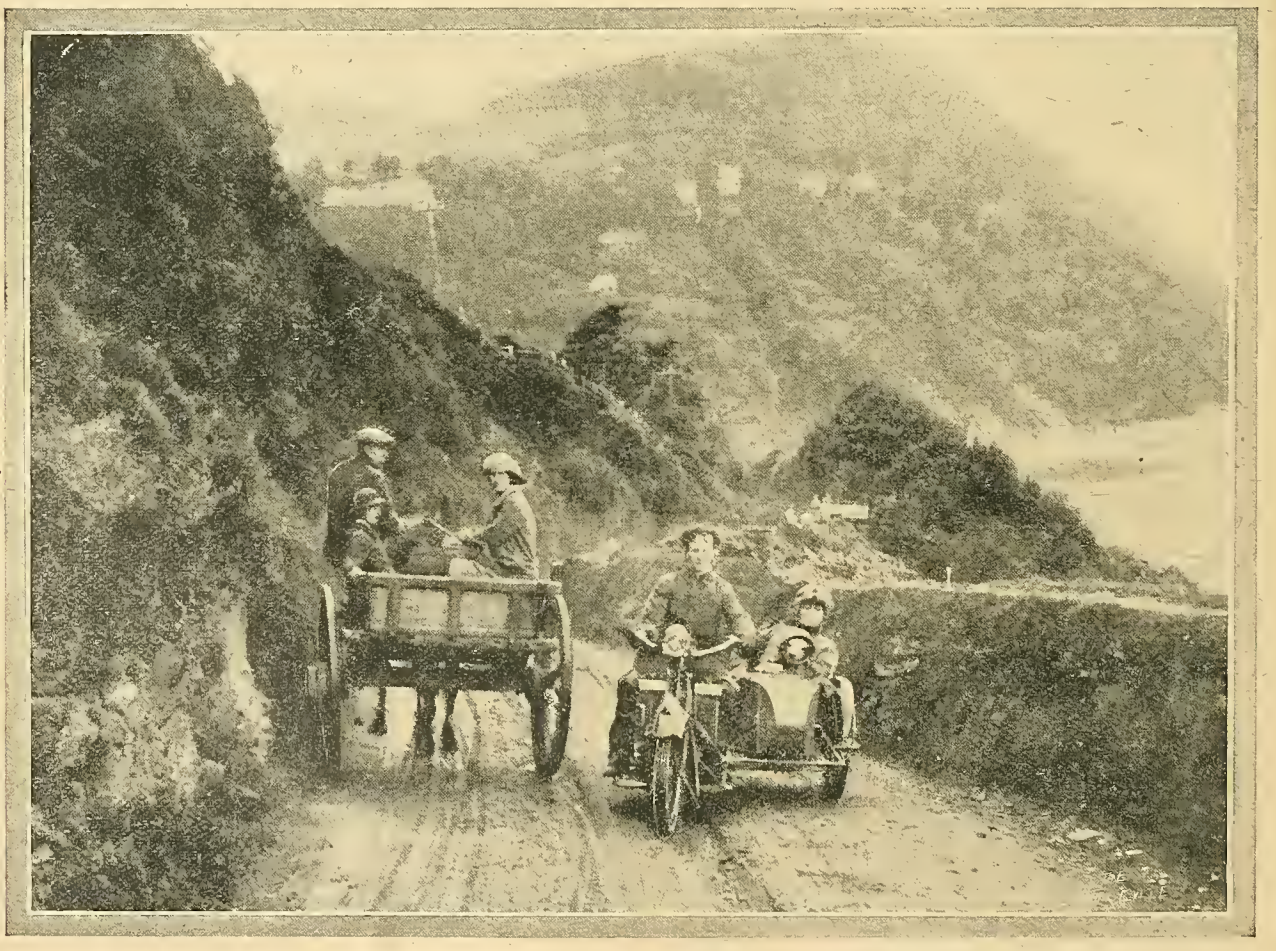
SUCCESSFUL BANK HOLIDAY TOUR ORGANISED BY THE M.C.C.

STARTING from Hungerford, on the Bath Road, on Saturday last, this event was run off over the same course as last year, being through Devizes, Radstock, Wells, Bridgwater (lunch), Minehead, Porlock (hill-climb), Lynmouth (hill-climb), Barbrook Mill (hill-climb), Watersmeet, and back to Lynmouth. For this run the record entry of fifty-nine was received, being double the number of last year's entry. There were eleven non-starters, of whom four were cycle car entrants, and a notable absentee was G. T. Gray and his new 7 Rudge and sidecar. The weather was very rough and wet for the time of year, and this made the task of climbing the test hills an exceedingly arduous one, especially for the solo riders.

Quite a number were early in trouble, Cole being particularly unfortunate in suffering a nipped tube four times before lunch. Coates broke the sprocket off his gear box near Bridgwater and retired. Batty-Smith had ignition troubles and retired at the same place. As Porlock Hill was approached the rain came down in torrents, and this made the surface exceedingly treacherous. Of the forty-seven who reached the hill twenty-three failed to make a clean climb. Many riders found it exceedingly difficult to maintain the standard speeds set for the various classes, and in endeavouring to do so many skidded and fell. Some notable failures were Colliver (Indian), Roberts (Blackburne), Wells (Indian sc.), and Meredith (Bradbury sc.). Gardiner (Williamson sc.) retired here, as did Douglass (Rex. sc.). We observed very good performances on the second corner by Selby, Beal, Colliver, Kerr, Winter, Howe, Tharp, Holroyd, F. W. Applebee (who made fastest time), Roberts, Longton, Clark, Egginton (splendid), Slingo, and Boxer.



Competitors outside the Lyn Valley Hotel, Lynmouth, during the tea halt.



A driver of a Williamson sidecar in the M.C.C. Devonshire Tour, on the greasy surface of Countisbury Hill.

Hill-climbing Trial in the West.—

One of the solo competitors ascending Countisbury Hill. The continuous downpour of rain made the surface very treacherous.

A car failed on Lynmouth Hill, and competitors rode up and down the hill whilst waiting for the car to be got away. Some competitors had gone up before the car failed, with the result that they were returning from the *détour* before the other competitors had started. There were nineteen failures of the forty-one who tackled the climb, but some were baulked by those who failed and stayed on the narrow hard portion of the road. It was particularly hard on Willey (3½ Premier sc.), who was going splendidly and was forced into the loose rough portion, and just failed to make a clean climb. The romance of Barbrook Mill Hill is gone, in consequence of the new and easier road which is now open. Competitors were, of course, sent up the old hill, and taken on the whole the surface was in very good condition.

A good deal of amusement was caused by the obvious displeasure of several of the lady passengers, who were annoyed at having to walk up the hills. Roberts ran the whole way up. Frasetti had hard luck in failing near the top, as he was the last of the Indian riders with a clean score. Cooper just got up by foot-slogging violently. Other failures were by O. P. C. Collier, Boxer, Meredith, Garland, D. S. Baddeley, Egginton, and Tippett, who was running and his radiator steaming. Winter's back wheel collapsed three miles from Lynmouth, and he came in on a car. Of the forty-eight who left Hungerford, forty completed the outward journey.

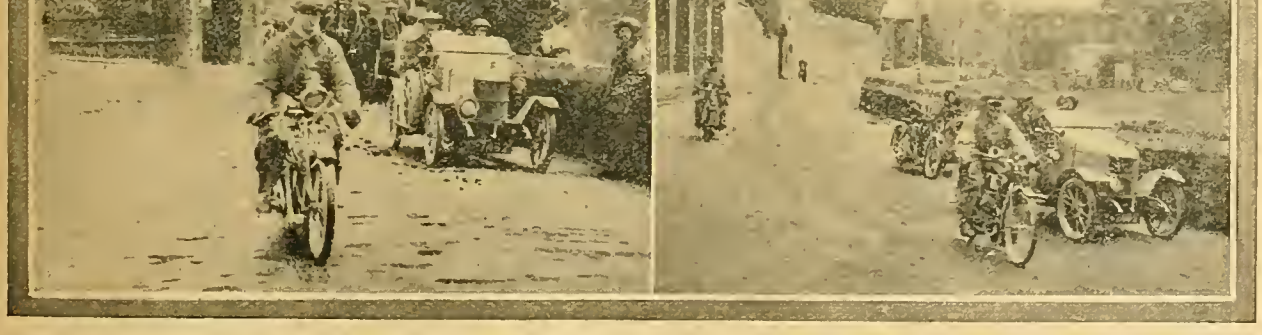
A Quiet Sunday in the West.

Sunday was spent pleasantly by those who were not attending to their machines. There were several walking parties to the Valley of Rocks and Watersmeet, and a party rode over to Malmsmead to inspect some of the local hills. Several washed their machines in the Lynn, much to the amusement of lookers-on.

The return journey, starting on Monday from Lynmouth, was over the same course as the outward journey, with the exception of the detour round Barbrook Mill. Of those who arrived on Saturday quite a number failed to present themselves for the return journey, amongst these being the Indian riders, with the exception of D. S. Baddeley (7-9 Indian sc.), who had only qualified for silver medals up to this point. Countisbury Hill was in a very greasy condition, but as the steepest gradient is only 1 in 5½ there were no failures. The run back as far as Bridgwater was uneventful, excepting for heavy rainstorms at intervals. After lunch Mr. Baddeley, the trials hon. sec., announced that, in consequence of the war causing anxiety to some of the competitors, who wished to get back to town quickly, no checks would be taken up to the finish at Hungerford, and that they could finish as early as they liked. This led to the more sporting members indulging in what was called the Devon T.T., and in hurrying quite a number lost their way and put in many extra miles. It also brought about the downfall of Fielder, who broke the frame of his New Hudson, and dropped the power unit on to the road when going at speed.

As no results will be available until they are passed by the committee, it is only possible to give the list of those who completed the trial.

L. A. Baddeley (3½ P. and M.)
J. D. Drysdale (2½ Connaught)
W. E. Cook (4 Triumph)
G. H. S. Letchworth (2¼ Clyno)
R. Charlesworth (5 Zenith)
S. Tharp (4 Bradbury)
R. M. Mirians (3½ P. and M.
J. H. Kerr (3½ N.S.U.)
J. F. Selous-Jeuks (2¾ A.J.S.)
H. J. Beal (4 L.M.C.)
S. J. Hine (3½ Burford)
G. P. Howe (3 B.S.A.)
J. S. Holroyd (3½ Blackburne)
L. Mogridge (3½ Rudge Multi.
C. Percival (2¾ Douglas)
C. Q. Roberts (3½ Blackburne)
H. Kershake (5-6 Ariel)
K. V. Cindley (3½ Brough)
D. S. Baddeley (7-9 Indian sc.)
H. A. Cooper (3½ Kerry-Abingdon)
F. W. Applebee (3½ Motosacoche)
O. P. C. Collier (4 Grandex-Precision)
R. B. Clark (3½ Rudge Multi)
W. H. Longton (3½ Allday)
H. G. R. Slingo (5-6 Clyno sc.)
Victor Cook (7 Matchless sc.)
W. H. Egginton (7 Matchless sc.)
C. W. Meredith (6 Bradbury sc.)
F. W. White (7-9 Premier sc.)
T. H. Willey (3½ Premier sc.)
H. E. Parker (6 Bradbury sc.)
W. P. Tippett (3½ Humber sc.)
Victor Garland (8 Williamson sc.)
Cecil C. Hann (G.W.K.)
L. Gilson (6 Zenith)



Passing Wells Cathedral during the M.C.C Bank Holiday Tour

Irish Two Days Reliability Trial.

THE Dublin and District M.C.C. successfully carried out their usual Bank Holiday fixture in the form of a two days' open reliability trial from Dublin to Glengariffe and back. The first day's route was by the old main road to Cork as far as Clogheen, where a deviation was made to take in the ascent of the Knockmealdown Mountains. The old road was joined at Cork, and thence the riders proceeded to Glengariffe by the Pass of Keinmaneigh. On the return journey on Monday a deviation was made into Co. Kerry, so as to include most of the new ground which was covered in the recent End-to-end of Ireland Reliability Trial. Fortunately, the weather conditions throughout were of a more favourable character than was experienced in the former competition, and consequently the hills did not present any great difficulties. On Monday the return was made to Dublin.

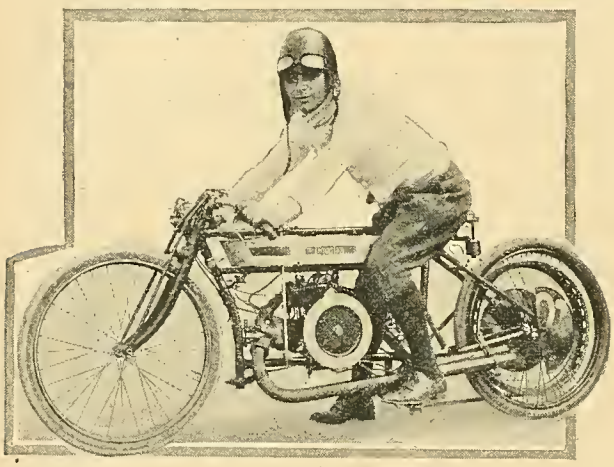
Although the conditions were not less strict than usual, the committee made an effort to prevent the awards being won by variation in seconds, and to this end a new regulation was introduced requiring the competitors to furnish a report of all repairs, replacements, or adjustments made during the trial. In the event of two or more competitors tying for any prize with an equal number of marks, the reports so furnished will be taken into account, and one point deducted for each repair, replacement, or adjustment. Only in the event of a tie still resulting will the variations from scheduled time at the secret controls be taken into account. The following completed the two days' run:

G. Roche (3½ Rover), P. Grimes (3½ Rover), J. Doleman (3½ Rover), A. W. Mooney (6 Bradbury sc.), H. Macrae (2½ New Imperial), J. F. A. Day (2½ Sun-Villiers), J. A. H. Waters (2¾ Douglas), J. Browne (3½ Rover), T. Toole (3½ Rover), F. M. Summerfield (6 New Hudson sc.), T. J. Woods (3½ B.S.A. sc.), J. O'Dwyer (2¾ Douglas), J. Clarke (4 Hobart), R. Armstrong (6 Enfield sc.), H. W. Gibson (3½ Rudge), W. H. Freeman (7 Indian sc.), S. Allen (3½ N.S.U.), R. Walshe (3½ Rover), and D. Morrogh (Calthorpe cycle car).

Of the four teams of three each which entered for the team prize, two finished, viz., Waters, Mooney, and Freeman, and Roche, Doleman, and Browne. Clean ascents of the observed hill between Kenmare and Killarney were made by Walshe, Toole, Browne, Waters, Day, Doleman, Grimes, and Roche.

B.A.R.C. Bank Holiday Races.

A LARGE number of entries were obtained in both the races provided for motor cycles at the well attended meeting organised by the B.A.R.C. on Bank Holiday. Unfortunately, a great deal of trouble was experienced with carburation, owing to the peculiar climatic conditions prevailing at the time. No inconvenience, however, resulted from inclement weather, although it looked very threatening at times, and the wind was also rather strong, but despite these disadvantages fast times were accomplished.



S. L. Bailey, who won the long handicap at Brooklands on Monday last on his 350 c.c. overhead valve Douglas, at a speed of 61½ m.p.h.

Douglas machines obtained the premier award in both races, and were lapping at over 60 m.p.h. In the first race there were thirty-seven entrants down on the programme, most of whom were at the starting point. G. Williamson and L. W. Forinton put up excellent performances on Indian machines, but could not manage to catch up the first two or three speedy lightweights with long starts, and the order of finishing was as follows:

1. S. L. Bailey (2¾ Douglas).
2. E. J. Webster (3½ N.U.T.).
3. E. Kickham (2¾ Douglas).

The winner's speed was 61½ m.p.h.

During the interval between the races A. L. Pullin (3½ Rudge), who had evidently experienced carburetter troubles, was seen changing the float. A 2¾ Singer belonging to J. P. Le Grand was also experiencing trouble as its owner informed us that the piston was cracked in two places. A still larger number of entries comprised the second event, for the field consisted of no fewer than forty-four. The race, which was run over a distance of 5¾ miles, against 8½ miles of the first race, again proved a triumph for the Douglas, the result being as follows:

1. E. Kickham (2¾ Douglas).
2. E. J. Webster (3½ N.U.T.).
3. L. W. Forinton (7 Indian).

The winner's speed was 62 m.p.h.

Edinburgh M.C.C. Gymkhana.

ALTHOUGH the weather conditions which favoured the Edinburgh Club's sports were far from alluring, there was nevertheless quite a crowd present to witness the competitions. As usual during an event of this nature, one or two performances were outstanding. In the exhibition trick riding and driving event, A. U. R. Downie (2¾ A.J.S.) performed some really excellent balancing feats, such as standing on the saddle and driving with two strings attached to the handle-bar, riding backwards, etc. J. W. Moffat (2¾ Sunbeam) was also good.

The sidecar and car football matches provided many thrills, and the manner in which the combatants manipulated their machines excited loud applause.

Several unrehearsed incidents did much to assist in the enjoyment of the afternoon, the star turn being J. A. W. Beaton, who in his effort to cover the hundred yards in the trailing race at evens carried away the erection holding up the buns for the bun event. In this same event, J. Steel, who was trailed behind A. H. Alexander, finished on his back, thereby being disqualified. Results:

Forty yards fast race.—J. A. Porter (2¾ Douglas).
Twenty-five yards slow race.—J. W. Moffat (2¾ Sunbeam).
Plug changing.—H. Alexander (2¾ Douglas).
Water race.—A. H. Alexander (2¾ Douglas).
Trailing race.—J. R. Alexander.
Obstacle race.—A. H. Alexander (2¾ Douglas).
Bun race.—A. H. Alexander (2¾ Douglas).
Zigzag race.—H. Alexander (2¾ Douglas).
Run and cycle race.—J. Steel (2¾ Douglas).
Sidecar football match.—J. A. W. Beaton (8 Matchless).
Potato race.—H. Alexander (2¾ Douglas).
Trick riding.—A. U. R. Downie (2¾ A.J.S.)
Turn-out competition.—J. A. W. Beaton (8 Matchless).

OPEN SPEED TRIALS AT PENRITH.

THE Penrith and District M.C.C. held their first open speed trials on Bank Holiday. The events were run off in the beautiful Lowther Park, by kind permission of the president of the club, the Earl of Lonsdale). The course was a half-mile in length, almost straight and very fast. The substantial entry of ninety-five was received, being divided into thirteen classes catering for every type of machine. The honours of the day were shared by F. Dixon (7 Indian) and A. Brewin (8 Zenith), both of whom covered the course in 24⅘s., the former, by making this time on three successive occasions, put up by far the most consistent performance of the day, the masterly way in which he handled his big machine creating admiration among the spectators. This being the club's first attempt at organising an open competition the officials are to be congratulated on the success of the meeting. Results:

CLASS I.—Two-stroke Singles not exceeding 350 c.c. On Time. Open.
1. S. C. Cook (2¼ Ixion) ..... 42⅘ secs.
2. E. F. Gilbanks (2¼ Connaught) ..... 43⅕ secs.
The two competitors tied, and the above times are the result of the run-off.

CLASS II.—Two-stroke Singles not exceeding 350 c.c. On Time. Expert barred.
S. C. Cook (2¼ Ixion) ..... 42⅘ secs.

CLASS III.—Single-cylinders not exceeding 350 c.c. On Time. Open.
1. W. Heaton (2¾ A.J.S.) ..... 31⅘ secs.
2. H. Rhodes (2¾ A.J.S.) ..... 32⅕ secs.

CLASS IV.—Single-cylinders not exceeding 350 c.c. On Time. Expert barred.
R. Hodgson (2¾ Diamond) ..... 44⅕ secs. (w.o.)

CLASS V.—Single-cylinders not exceeding 560 c.c. On Time. Open
1. G. Kendall (3½ Norton) ..... 28⅕ secs.
2. E. Gilbanks (3½ Rover) ..... 29⅕ secs.
3. J. Laycock (3½ Rover) ..... 30 secs.

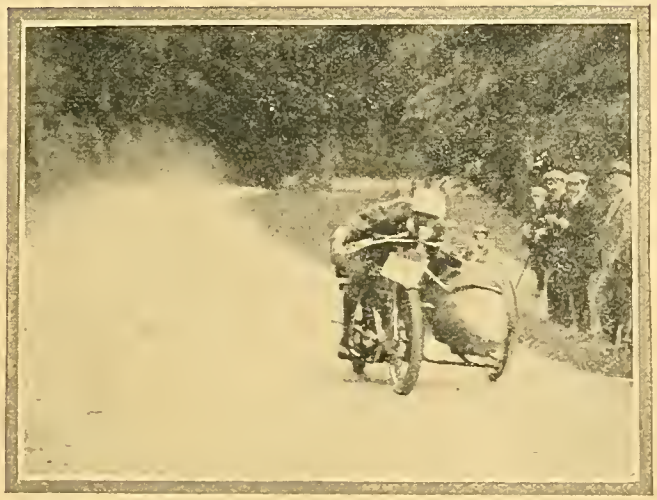
CLASS VI.—Single-cylinders not exceeding 560 c.c. On Time. Expert barred.
1. G. Kendall (3½ Norton) ..... 27⅘ secs.
2. J. Laycock (3½ Rover) ..... 29⅘ secs.
3. E. Gilbanks (3½ Rover) ..... 30⅕ secs.

CLASS VIA.—Any capacity. Members. On Formula.
1. H. A. Rhodes (2¾ A.J.S.) ..... 30⅕ secs.
2. S. Barron (3½ N.U.T.) ..... 30⅘ secs.
3. W. Armstrong (3½ Bradbury) ..... 34⅕ secs.

CLASS VII.—Twin-cylinders not exceeding 350 c.c. On Time. Open.
J. Robinson (2¾ N.U.T.) ..... 34⅘ secs.

CLASS VIII.—Twin-cylinders not exceeding 350 c.c. On Time. Expert barred.
J. Robinson (2¾ N.U.T.) ..... 33 secs.

CLASS IX.—Twin-cylinders not exceeding 500 c.c. On Time. Open.
1. R. Bownass (3½ N.U.T.) ..... 29⅕ secs.
2. L. S. Parker (3½ Scott) ..... 30⅘ secs.



E. Burras (3½ h.p. Zenith) on the starting line in one of the sidecar events.

CLASS X.—Twin-cylinders not exceeding 500 c.c. On Time. Expert barred.
1. J. Rigg (3½ Scott) ..... 29⅘ secs.
2. S. Barron (3½ N.U.T.) ..... 32⅘ secs.

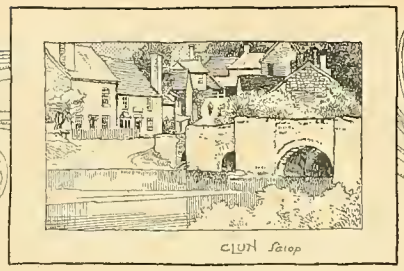
CLASS XI.—Twin-cylinders 351 c.c. and upwards. On Time. Open.
1. F. Dixon (7 Indian) ..... } 24⅕ secs.*
   A. Brewin (8 Zenith) ..... }
3. B. Jeffreys (8 Zenith) ..... 26⅕ secs.
The run-off resulted in Dixon making the same time, Brewin being 3 secs slower.
*Fastest time of the day

CLASS XII.—Twin-cylinders 351 c.c. and upwards. On Time. Expert barred.
1. F. W. Dixon (7 Indian) ..... 24⅕ secs.
2. B. Jeffreys (8 Zenith) ..... 25 secs.
3. S. Seal (7 Indian) ..... 26⅕ secs.

CLASS XIII.—Any Machine. On Time. Open.
1. F. W. Dixon (7 Indian) ..... 25 secs.
2. B. Jeffreys (8 Zenith) ..... 25⅕ secs.
3. A. Brewin (8 Zenith) ..... 26 secs.

CLASS XIV.—Sidecars, any capacity. On Formula. Open
1. F. W. Dixon (7 Indian sc.) ..... 31 secs.
2. H. A. Rhodes (2¾ A.J.S. sc.) ..... 38 secs.
3. W. Armstrong (3½ Bradbury scr.)..... 43⅘ secs.

A. I. Moffat (5 h.p. Zenith) crossing the finishing line All competitors were given a flying start



CLUB NEWS

"THE MOTOR CYCLE" LIST OF CLUB EVENTS.

Aug. 8th.—Coatbridge and District M.C.C. 80 miles non-stop run, starting at 2 p.m.
" 8th.—Middlesbrough and District M.C.C. Hill-climb at Danby.
" 8th.—Middlesex M.C.C. Social run to Chipperfield.
" 8th.—Brighton and Hove M.C.C. Gymkhana at Shoreham.
Aug. 12th.—Coatbridge and District M.C.C. Flexibility hill-climb, at 5.45 p.m.
" 12th.—Plymouth and District M.C.C. Gymkhana near the Rock, at 5.30 p.m.
" 12th.—Midland L.C.C. Evening run to Leamington.

Bolton and District M.C.

A reliability trial was held last week, the course being as follows: Rivington Lakes, Preston, Brock, St. Michaels, and Blackpool. A great many failures were recorded on the observed test hill. Results—First Awards: A. C. Naylor (2¾ Douglas), Stanley Parker (6 Enfield), and E. Knowles (3½ B.S.A.) Prize for the best ascent of the hill: J. Fishwick (3½ Rudge).

Surrey M.C.C.

The annual speed trial was held on July 29th. The results, subject to confirmation by the committee, are as follow:

Class I.—Passenger Machines.

		Time.	Formula.
1.	T. G. Meeten (3½ Rudge sc.)	41.4s.	355
2.	T. H. Willey (3½ Premier sc.)	42.7s.	389
3.	A. Boorer, jun. (3½ Rover sc.)	44.1s.	429

Class II.—Touring Motor Cycles up to 350 c.c.

1.	F. J. Pigot-Disney (2¾ Douglas)	39.1s.	210
2.	T. G. Meeten (2 O.K. Junior)	48.8s.	221
3.	H. Mitchell (2½ Premier)	45.7s.	234

Class III.—Touring Motor Cycles of 351-560 c.c.

1.	S. Holbrook Crow (3½ Zenith)	34.6s.	207
2.	T. G. Meeten (3½ Rudge)	35.6s.	226
3.	P. Mitchell (3½ Premier) / A. Boorer, jun. (3½ Rover)	36.4s.	241

Class IV.—Touring Motor Cycles over 560 c.c.

1.	F. J. Pigot-Disney (6 Zenith)	35.1s.	332
2.	E. J. Vardon (5 Bat)	36.0s.	349

Class V.—Open Class (on Time).

1.	E. J. Vardon (5 Bat)	32.0s.
2.	T. G. Meeten (3½ Rudge)	32.9s.
3.	S. Holbrook Crow (3½ Zenith)	35.0s.

The silver medal for best figure of merit by a non-trade member was won by F. J. Pigot-Disney (2¾ Douglas); and the bronze medal for the sealed handicap by T. G. Meeten (3½ Rudge), S. H. Crow (3½ Zenith) being second.

The times and figures given in Classes I. to IV. are inclusive of penalties if any) for T.T. models, etc.

Ballymena and District M.C.C.

A social run combined with a petrol consumption test took place on the 22nd ult. to Portrush and back. In some cases the solo machines averaged as much as 160 m.p.g., and some of the sidecars 100 m.p.g.

Middlesex M.C.C.

The winners in the club's annual gymkhana held at Little Berkhampsted were as follow:

Balloon Bursting.—T. A. S. Brown (Triumph).
Potato Race.—G. Fletcher (Douglas)
Musical Chairs.—R Clark (Rudge).
Hockey Race.—J. A. Hilger (Rover). Ditto Sidecars, G. Fletcher (Douglas).
Cigarette Race.—T. A. S. Brown (Triumph). Ditto Sidecars, G. Fletcher.
Circling Flags.—G. Fletcher (Douglas). Ditto Sidecars, Pittock (James).

Dublin and District M.C.C.

The flying half-mile competition was held by the above club in the early hours of Wednesday morning of last week on a deserted piece of road outside Dublin. Some very fast times were accomplished. Results:

1, T. E. Greene (3½ Rudge), 25.4s.; 2, F. Holmes (3½ Rudge), 27.5s.; 3, W. Curtis (3½ Indian), 29.7s.; 4, J. Shield (3½ Rover), 31.1s.; 5, F. Wallen, jun. (3½ Triumph), 36.2s.

Derbyshire and North Stafford A.C. (Motor Cycle Section).

In spite of a pouring wet day twenty-one competitors turned out to compete in the inter-club hill-climb for the Bolton Challenge Cup and other prizes at Oakamoor on July 25th. The hill was too wet to be greasy. The entry included several T.T. riders from the Wolverhampton Club. The fastest time of the day was made by W. Stevens on his 2¾ A.J.S. Fast ascents were also made by A. F. W. Greeves (3½ Triumph), G. Stocking (3½ Sunbeam), and G. Brough (3½ opposed twin Brough). T. Heath (6 Clyno sc.) won the Bolton silver challenge cup and silver medal for the knock-out on handicap event, W. Stevens (2¾ A.J.S.) being the runner up. The silver cup presented by Mr. D. C. Bolton for the best performance on A.C.U. formula was won by J. R. Sylvester, of Nottingham, on his 2½ New Hudson.

In the cycle car class D. C. Bolton (Bolton-Precision) made fastest time, and P. E. Joule (8 Humberette) won the silver cup presented by Mr. F. A. Bolton in the knockout event.

The ubiquitous A.A. scout performs a useful service at a dangerous cross road

Club News.—

Eastern Counties M.C.

For the recent run to the Surrey hills twenty-five members turned out, and an enjoyable picnic was held, after which those members who cared tried various hills of repute, and some good performances were made.

Mid-Bucks M.C.C.

The above club held speed trials over a half-mile course in Aston Clinton Park, near Aylesbury, on Thursday, July 23rd. There were about sixty entries, and the winners in the various classes are as follow:

CLASS I.—Motor Cycles up to 350 c.c.

	Time.	Formula.
J. Simpson (2¼ Hobart)	37⅘ secs	1330

CLASS II.—Motor Cycles over 350 c.c. and up to 500 c.c.

On Time.

E. W. Ruscoll (3½ Rover)	*30⅘ secs.

On Formula.

H. Logan Turner (3½ Rudge)	32⅘ secs.	1235

CLASS III.—Motor Cycles over 500 c.c. and up to 1,000 c.c.

J. Kennedy (3½ Zenith)	31 secs	1166

CLASS IV.—Passenger Machines of any capacity.

J. W. Tollady (3½ Singer sc.)	39⅘ secs.	1424

CLASS V.—Motor Cycles of any capacity (Handicap), for "Douglas" Challenge Cup and Club Gold Medal.

	Actual time.	Handicap.	Net time.
J. W. Tollady (2¾ Ivy-Green)	34⅘ secs.	6 secs.	28⅘ secs.

Fastest time—J. Kennedy (3½ Zenith) .. 31⅘ secs.

CLASS VI.—"Old Crocks" (open to machines over four years old), for Gold Medal presented by J. W. Tollady.

	Actua. time.	Handicap.	Net time.
A. Wilson (3 Triumph)	49⅘ secs.	3 secs.	46⅘ secs.

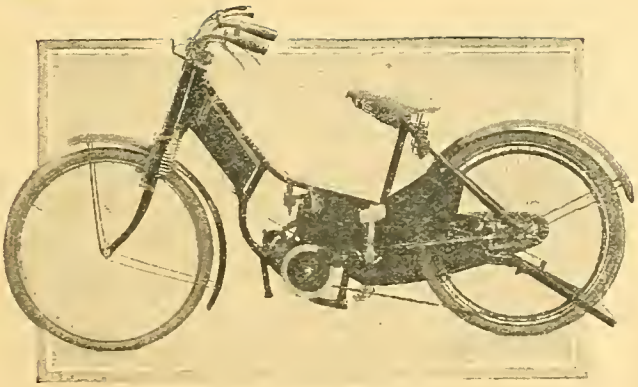
CLASS VII.—"Needle Threading," for Sidecar Machines with Lady Passenger.

E. G. Eborn (3½ Eborn-Green) ..... 1m. 18s.

*Fastest time o the day.

RETURNING FROM A PICNIC.

Mrs. Hunter, of Hull, on her 6 h.p. Rex sidette with two lady passengers, photographed on the Withernsea Road near Hedon. A few minutes after the photograph was taken Mrs. Hunter was stopped and asked for her licence, which, however, she was able to produce.



The latest model Millard lightweight for ladies, which is propelled by a 1 h.p. J.E.S. engine. It will be observed that the power unit is provided with neat shields

Carlyle (Chelsea) C. and M.C.C.

The non-stop run and speed-judging contest held recently resulted as follows: 1, C. Moore (4½ James sc.), non-stop; 2, W. Langley (3½ Rudge-Multi), 3min. error; J. Laffeaty (3½ Premier sc.), 8min. error.

Westmorland M.C.C.

A fixed gear reliability run was held at the month over a fairly stiff course of 125 miles. On petitors successfully got through non-stop. Resu M. Somerville (6 Zenith), correct time; 2, W. Hu (6 Bat) and B. Jefferys (8 Zenith), 5 sec. out; 4, Braithwaite (3½ Rudge), 10 sec. out; 5, R. M. Chaplow Humber), 55 secs. out.

Ashford and District M.C.C.

The results in Oxford trial are given below:

OPEN CLASS.—1, F. G. Barratt (4-5 N.S.U. and sidecar), error 240, gold medal; 2 J. G. Bowyer (2¾ Douglas), 290, silver and gold medal; 3 W. Kennedy (2¾ Douglas), 515, silver medal.

MEMBERS' CLASS.—1, R. B. Whiffen (2¾ Douglas); 2, W. V. Westlake (5-6 Clyno and sidecar).

VISITORS' CLASS.—1. C. Reeves (10 Singer light car); 2, J. G. Haggard (5-6 Clyno).

The TEAM PRIZE was won by Ashford and District M.C. North Whiffen, and Westlake).

FORTHCOMING OPEN EVENT.

South-Eastern Inter-club Team Trial.

The third south-eastern counties inter-club team trial for the Woolwich Challenge Cup will be held under the auspices of the Woolwich, Plumstead, and District Motor Club on the 15th inst., starting at 10 a.m.

Each team must consist of six riders, and any type of machine under A.C.U. rules is permissible. The joint weight of passenger and driver shall not be less than twenty stones. To qualify for starting, each team shall provide an additional rider (and machine) to act as an observer, who shall be at the disposal of the promoting club during the progress of the competition. Lady drivers will be permitted.

The competition shall consist of a non-stop run of about 100 miles, over a circular course, to be covered twice.

Sufficient fuel and oil must be carried for each circuit of the trial. Competitors may replenish from a metal receptacle carried by them, provided such replenishment is effected by the driver while the machine is in motion. Such fuel or oil must be carried from the start, and not be taken up after starting.

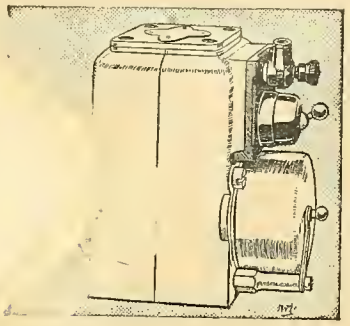
The number of miles accomplished by each rider of each team without stoppage other than stoppages due to the exigencies of traffic will be added together, and the team scoring the highest mileage thus arrived at shall be the winner, except that in the event of more than one team making a full score in mileage, in which case the times taken at the checks shall be the determining factor, and the team that has ridden nearest to scheduled speed the winner.

Entries, to Mr. F. J. Ellis, 23, Woolwich Common, S.E., close on the 8th inst.

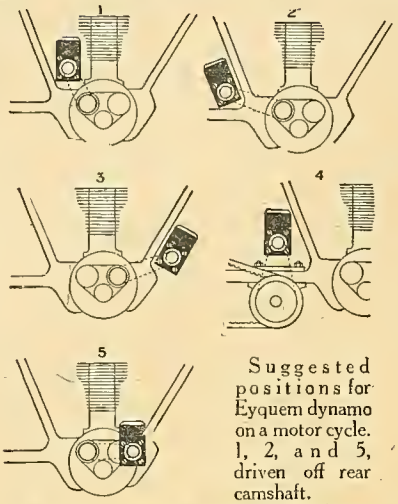
The Eyquem Dynamo Lighting Outfit.

OWING greatly to the enormous popularity of the sidecar combination the desire for luxury and refinement goes on in leaps and bounds, for we now seem to be nearing the day when electric illumination will oust all other forms, because of its cleanliness and general utility. There is no doubt that a well-designed electric outfit is a very great asset, and the one we are about to describe is an excellent device, and can be readily fitted to any existing machine with a comparatively small amount of alteration.

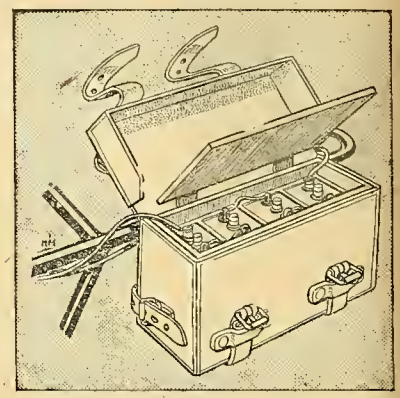
Fig. 1 shows a series of positions in which the machine can be housed, and, as can be seen, there are a large variety of places for such a purpose. Current is generated at 1,600 r.p.m., and with the aid of an electric control very rapid acceleration up to a high number of revolutions can be performed without risk of burning out the lamps, should it so happen that current is being taken directly from the dynamo instead of from the battery. A neat case is provided for the accumulators, which are of the non-spillable type, and is designed to be strapped to the carrier as illustrated. Two very nice external features are the switch and terminal, the former being made on very solid lines. Another point well worthy of mention is its effective locking device, which consists of a split and hollow plug, which is held tightly in position by being expanded with a screw, the end of which is extended and tapered. Further information and details can be obtained by applying to E. Jozót, Ltd., 59-61, New Oxford Street, London, W.C.



The Eyquem dynamo.

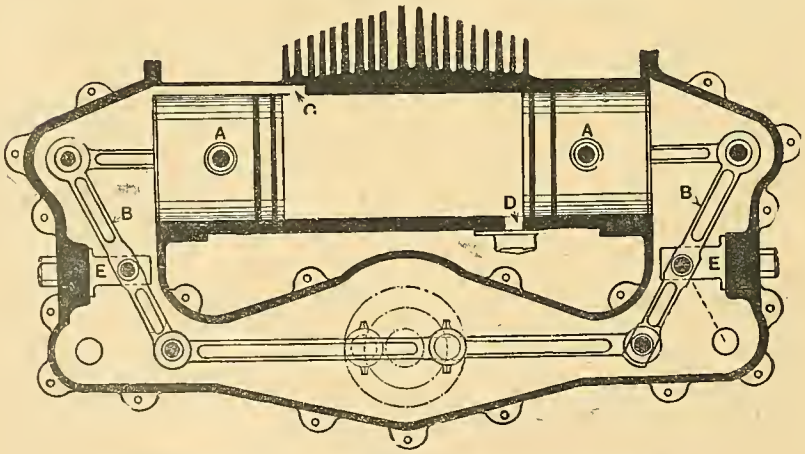


Suggested positions for Eyquem dynamo on a motor cycle. 1, 2, and 5, driven off rear camshaft. 3, driven off front camshaft. 4, driven off counter-shaft pulley.



Storage battery supplied in a leather case lined with wood and made to attach on side of carrier.

A Horizontally Opposed Two-stroke Engine.

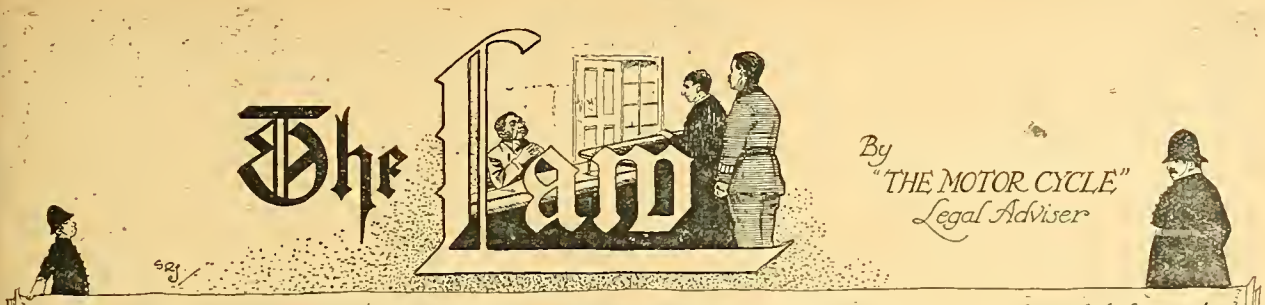


Diagrammatic sketch of the Simpson double acting two-stroke engine.

A. Pistons.
B. Connecting arms, giving ratio between crank stroke and piston travel.
C. Inlet port.
D. Exhaust port.
E. Fulcrums for connecting arms.

A two-stroke engine of neat design is now being experimented with at the Eagle Works, Cable Street, Blackburn. This particular power unit is known as Simpson's balanced two-stroke, and, by a careful perusal of the accompanying illustration, the description of the various working parts will be readily grasped. The connecting rods are attached at their big ends to rocking levers, which are pivoted to lugs cast on the outer casing. The other ends of these levers are connected through the connecting rods to a couple of crank pins, which correspond to those of the crankshaft. Induction takes place at the port C, which is uncovered by one piston, and the exhaust through the port D, uncovered by the opposing piston. Also, it will be noticed that the cylinder is air-cooled, as the designer does not think it necessary to have water-cooling. The advantages claimed are that a long piston travel can be obtained with a short crank, which allows the maximum amount of expansion to take place in the exploded charge. By having two pistons opposed in this manner good balance is obtained and the strain on the cranks is halved. The ratio of the piston travel to the length of crank is such that with a crank stroke of one and three-eighths of an inch, a piston travel of three and three-quarter inches is obtainable.

A South African rider of a Triumph, W. Campbell, who recently won the fifty-three miles road race, held by the Free State Automobile Club at Bloemfontein, for the Continental Trophy. His time for the entire distance was 56m. 56s.



Simple yet important facts which every Motor Cyclist should know.

MY intention is to treat, as far as is possible in an article of this length, of the obligations of motor cyclists as users of the King's highway; of the duties of persons with whom they will probably enter into business relations; and briefly to detail the steps which should be taken by those unfortunate enough to meet with accidents on the road.

"Reasonable Care" on the Road.

Besides duties imposed upon him by regulations and byelaws, every road user is under certain other obligations. "All persons," says a learned judge, "paralytic as well as others, have a right to walk on the road, and are entitled to the exercise of reasonable care on the part of persons driving carriages on it." What, then, is reasonable care? No definition can be given; it must always depend on the circumstances of the case. The rule of the road should be observed, but non-observance of this rule is not conclusive evidence of negligence on the part of the offender, nor does it justify anyone travelling in the opposite direction in running into him; if he does so, the latter may, under certain circumstances, find himself liable in damages to the person who has broken the rule. The only rule which can be laid down is that drivers should generally keep their correct side, but, if they see that by keeping to the correct side they are more likely to meet with an accident than if they go over to the wrong side, they must go over.

Passing Tramcars.

Another problem which confronts motorists in towns is whether they are bound to pass a tram which they are overtaking on the far side. There is no obligation on them to do this; they may pass on either side so long as they exercise a proper discretion as to the side on which they pass. If an accident occurs through their neglect to exercise a proper discretion they will be held liable to the person injured through their negligence.

What to do in Case of Accident.

As negligence or lack of use of reasonable care is a question of fact, it will be perceived how necessary it is that a rider who has had the misfortune to meet with an accident should either take or have taken by someone on his behalf immediate steps to obtain, and as far as possible place on record, all facts connected with the occurrence. The first thing to be done is to ascertain the other party's name and address, as also those of all witnesses to the accident, and of all persons who have seen the spot before the *débris* has been removed. The roadway should be measured from the precise place of impact (as nearly as the same can be ascertained) to either kerb, and the measurements verified, if possible, by some impartial observer. Also the spot where the damaged machine or machines lay after the accident should be noted, as should, if possible, the wheel marks of the other vehicle (if one is involved in the accident), and these facts similarly verified. Signed proofs should be obtained from the witnesses, the points particularly to be borne in mind being on what side of the road was the other party? did either or both parties sound their horns? were either party's lamps lighted? at what speed were the machines travelling? were any admissions made? But, of course, the evidence requisite depends upon all the circumstances of the case, and perhaps it is better taken by a solicitor. Under no circumstances should any admission be made, as what may appear evidence of liability to the lay mind may show absolutely no negligence. It is, also, unwise to make any payment at all to the other party, as that may seriously prejudice the case if subsequent legal proceedings are taken; if any payment is made it should be done in the presence of at least one witness, and the recipient should be clearly informed that it is made *e gratia* and without admitting any liability on the payer's part. I would impress upon all readers who are insured the necessity of giving all details, together, if possible, with a plan, to their insurers. Non-insured riders should, in all cases of accident, consult their solicitor. If no proceedings are subsequently taken a small fee is sacrificed, but if anything does come of the matter the advantages of an early consultation may be inestimable.

Stop upon Request.

If an accident occurs owing to the presence of a motor vehicle on the road the driver is bound to stop at once, and, if required, must give his name and address, as also the name and address of the owner and the registration mark or number of the vehicle. Motorists must also stop on the request of a constable in uniform, or of any person in charge of a horse (whether an accident has occurred or not), if any such constable or person raise his hand as a sign for that purpose.

The Ways of Some Repairers.

There comes a tide in the affairs of most motor cyclists when the services of a more or less experienced repairer are necessary, and in such cases a preliminary estimate should always be obtained. If this is not done the repairer is entitled to charge a reasonable price for the work done, and on this subject the views of the owner and repairer

The Law.

often differ. I find from letters received by *The Motor Cycle* the only way to obtain a correct view of the matter is by having recourse to litigation, which, having regard to the comparatively small sum usually in dispute, proves to be an expensive and generally unsatisfactory course to pursue. The repairer is entitled to retain possession of the motor cycle until the price agreed upon for the work (or, in default of such preliminary agreement as we have indicated, a reasonable price) is paid, but he has no power to dispose of the machine.

The Liabilities of Innkeepers

A word or two with reference to innkeepers may not come amiss. An innkeeper is bound to supply rest and refreshment to travellers who require them provided he has accommodation and the traveller is not suffering from any infectious disease, and his conduct is not disorderly and calculated to annoy other guests at the inn. He has a right to retain the property of his guests as security for the payment of his bill, and, unlike the repairer, he has power, after the goods have been in his custody for six weeks, to sell such property in order to reimburse himself out of the proceeds after complying with certain provisions as to the advertising of the sale. The innkeeper is liable for the loss of the goods of his guests unless such loss is caused by the flagrant negligence of the guest or his servant, but before the innkeeper becomes responsible it must be shown that the motor cyclist has become his guest, *e.g.*, by having a meal at the inn. If he complies with the provisions of the Innkeepers' Act (and in practice the landlord inevitably does so) such liability in respect of most property does not exceed £30 unless the loss be caused by the wrongful act, neglect, or default of the innkeeper or any servant in his employ, or the goods have been deposited expressly with him for safe custody. If the guest has goods in his possession worth more than £30 he should, therefore, always deposit them with the landlord, who loses all his right to exemption from liability exceeding £30 if he refuses to receive them if they are placed in a fastened box or other receptacle by his guest. The Act does not apply to carriages (which term includes motor cars and presumably motor cycles), regarding which the innkeeper's liability is still unlimited.

—and Garage Proprietors.

The liability of a garage proprietor is of a very different nature, he being only liable for damage to cars and cycles on his premises for storage or repairs, which occurs through his own negligence or that of his servants. Thus he would not be liable for damage caused by an accidental fire, but would be liable if the fire were started through his own or his servants' negligence.

A Legal Recommendation to Insure.

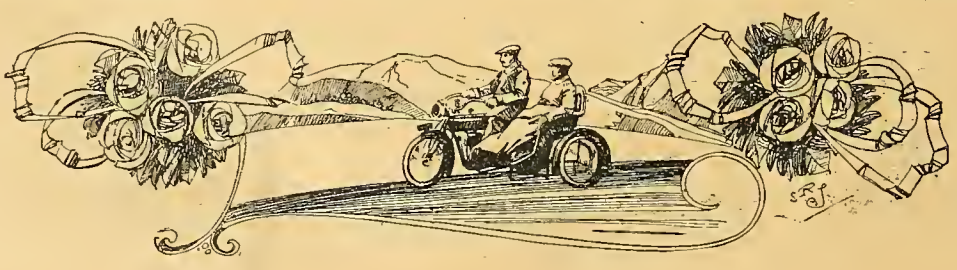
It has only been possible for me to show some few of the risks which even the most careful and experienced rider must of necessity run; as may be seen from the perusal of this article, his machine may in certain circumstances be damaged or utterly destroyed, and he may have no right of redress against anyone; it may be found in a Court of Law that his riding lacked that due care which every user of the highway is obliged to exercise; he may be condemned to pay to injured parties sums of money running into hundreds and even thousands of pounds; and considerable as we know the premiums charged by insurance companies appear to be, we cannot too strongly advise our readers to insure, both against damage to themselves and their machines and also against losses which they may sustain and liabilities which they may incur through accidents in which third parties are involved.

Number Plates and Rear Lights.

It is impossible, and I think unnecessary more than to mention the existence of regulations as to licensing of motor cycles and prohibiting excessive speed and dangerous riding, but, as many misconceptions apparently exist concerning the regulations dealing with lighting and number plates, it may be well to mention these subjects. Although there is now no necessity for motor bicycles to carry a rear light, motor bicycles having a sidecar attached and all two-track motor cycles must display a red light visible in the direction contrary to that in which the motor cycle is proceeding. The regulations on this point are set out *in extenso* in the issue of December 25th, 1913. With reference to number plates, motor cyclists should bear in mind that the background must be black, the letters and figures white. This regulation is broken by a considerable number of riders, and, from observations I have made, activity is being manifested by the police in certain parts of the country with regard to identification plates not complying with the regulations.

Silencer Cut-outs.

Riders will also remember the recent regulation prohibiting the use of any cut-out, fitting, or other apparatus or device which will allow the exhaust gases from the engine to escape into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance, suitable and sufficient for reducing, as far as may reasonably be practicable, the noise which would otherwise be caused by the escape of the gases. Besides these regulations, there are also many bye-laws dealing with motor cycles in force in various parts of the country, but these are too numerous to be dealt with in this article, in which I have indicated only the main legal points to be considered.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Carbon behind Rings.

I have a 2½ h.p. two-stroke motor cycle which has run perfectly up till a week ago, when it lost much of its power and seemed to dry up if driven at all fast for a time. Can you help me with the trouble?—J.R.C.

The symptoms you mention are probably caused by the top piston ring becoming sticky in its groove. This is not an uncommon occurrence, but is easily cured by removing the ring and cleaning it thoroughly. The drying up might be caused by pre-ignition. You should be very careful what plug you use. Preferably keep to the type supplied by the makers.

A Leaky Inlet Pipe.

I have recently purchased a new motor cycle, 4 h.p. J.A.P. engine and three-speed gear. I find I cannot get the machine to run slowly. Will you kindly inform me how I can obtain slower running? I have heard something about choke tubes. Will you inform me if they have any bearing on the matter, what they are, and how fitted?—J.O.B.

The trouble is almost undoubtedly due to an air leak in the inlet pipe union, a very common cause of failure to run slowly. You might also correspond with the makers of your carburetter, giving the size of jet, and they will probably be able to help you. The choke tube is the tube surrounding the jet which regulates the fixed air supply to the engine. In some carburetters this can be changed or altered.

Curious Symptoms.

I have just had my 1912 3½ overhauled, a new gudgeon pin fitted, and the big end re-bushed, by an experienced man, but now it overheats. The crank case gets almost as hot as the cylinder; the piston and rings are a good fit, the valve timing and ignition are set just the same as before it was taken down, and the man who repaired it is quite puzzled with it, and does not know what to do to make it right. I shall be pleased if you can help me in any way.—A.B.

If it is only the crank case which gets hot we do not think you need worry, as this is simply through conduction. You do not say if the machine is running badly or if you suffer from loss of power. Unless this is the case we do not think you have any cause for complaint.

Magneto Troubles.

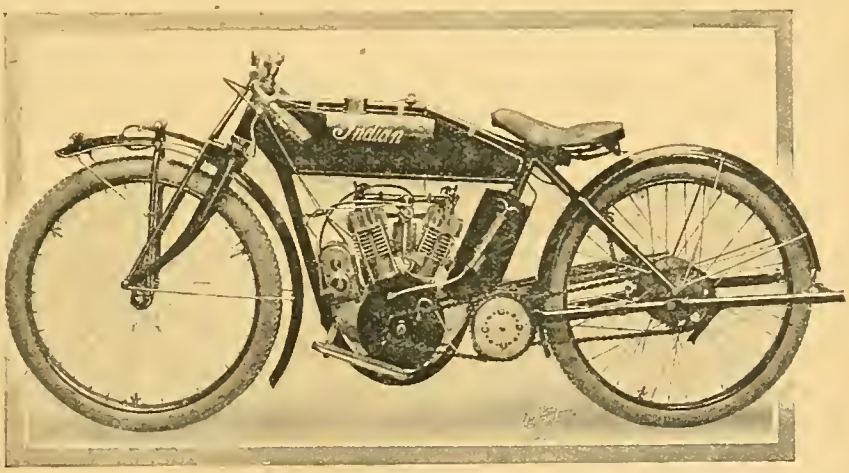
I have a 1912 2¾ h.p. twin motor cycle, and have had trouble with it recently. I had to take the engine down to fit two new bolts on magneto platform. I assembled the engine again and timed it correctly, but I could not get engine to start until about a week afterwards. The engine then started nicely on the stand, but would only fire on the road whilst I ran alongside machine; the moment I jumped on, the engine stopped. I now tried the engine on the stand again, but with no avail. I tried the wires and they would not spark. I examined the carbon brushes, and they appeared to be in good condition. I then came to the conclusion that the magneto wanted re-magnetising. I should add that the second time I tried the engine on the stand there was no sign of even one explosion.—E.McA.

In the first place, we should advise you to look to the inlet pipe joints. If you get air leaks at this point you are sure to have trouble in starting, and this is one of the commonest failures happening to an engine after it has been taken down. Touching the magneto, we should say that the trouble is more likely to be due to a fault in the insulation of the high tension winding than to the magnets requiring to be re-magnetised, and the symptoms described in your letter seem to indicate this. After the machine has been standing the magneto will start. After it has been running a few seconds it will stop, and there is no sign of a spark. This is due to the wax melting at the point where the insulation has given out. It sets after standing and breaks down after a few minutes' running. On the other hand, if the magnets have sustained a sharp blow, they may have become de-magnetised.

A Scotch Tour.

I purpose spending a fortnight's holiday on my 2¾ Model R Douglas. I intend going as far as Thurso, staying overnight at Oban, Inverness, Thurso, returning to Inverness later on; thence to Aberdeen, thence by Ballater to Dunkeld, and back to Glasgow. I shall be greatly obliged if you will kindly let me know the condition of the roads as sketched out above. Is the road by Pitlochry and Kingussie to be preferred to the one by Oban? Should each of the sections indicated above be easily ridden in one day by a second year motor cyclist?—W.McG.

You will get roads of all sorts and kinds. In the extreme north they are likely to be very loose, and in places like Ballater and Dunkeld and so forth they are quite as good as they are in the south of England. The road by Pitlochry and Kingussie is in fair condition. Most of the sections referred to could be ridden in one day, regulating, of course, your starting time for the distance to be covered.



Chain side of the two-speed 500 c.c. Indian used in the Senior T.T. race. Last week "The Motor Cycle" made the announcement that a machine of this pattern and design would form one of the Indian range in 1915.

A Curious Trouble.

I shall be glad to hear if you are able to assist me in the following matter: My machine is a 3½ h.p. single-cylinder three-speed, new June, 1913, and sidecar. It has done about 2,500 miles. The engine runs well, takes hills on top with passenger, but overheats, crank case and all fittings in the vicinity of same getting almost too hot to hold. The cylinder has been cleaned and new valve springs fitted. The heel of left foot generally gets oil on it from air release in the engine pulley. The local man tells me it is all right, but as it has only overheated for the last two or three weeks I do not quite agree with him.—S.W.

You are probably using too large a jet, or, for some reason or other, the cam has become worn. As you say the machine takes a passenger comfortably, and climbs all hills on top, we should imagine that the overheating is of such a nature as to cause you no anxiety. The crank case may get hot merely through conduction or through defective piston rings. The oil comes from the crank-shaft centre, and it is quite a simple matter to arrange a small shield from the footrest.

To Alter Belt Line.

I have an old 2½ engine in good order which I recently bought with a frame. When fitting it up I found that the belt line is out by three-eighths of an inch. How can I get a suitable gear, as, with a 20in. belt rim, it would be too high?—T.W.

There are two ways out of your difficulty, one of which is to pack the engine over in the frame until you can get the pulley centres correct, or else to look round some second-hand shops and find a pulley for the rear wheel which protrudes rather more than yours does at the present moment, or less, as the case may be. If you wish to get a lower gear it would be best for you to make use of an adjustable pulley, and then you can get practically any gear ratio to suit your purpose.

Overheating.

I am not satisfied with the hill-climbing powers of my single-geared twin, as it often fails on bad hills, owing, apparently, to overheating. I keep the silencer clean, and have enlarged the holes. I use plenty of oil of good quality. Can you tell me how I can keep my engine cooler? Would long exhaust pipes have any effect? I shall be glad, too, if you can suggest how I can lower my gear for a trip to Devon and Cornwall. I want a method whereby I can effect the change by the roadside when I get amongst the hills.—J.M.

Carefully examine the adjustment of your tappets and see that there is no greater clearance than the thickness of a piece of notepaper when the engine is warm. The best plan is to have an adjustable pulley and use two belts. There are a number of adjustable pulleys sold suitable for your machine, or you might try a Philipson pulley (Holland Street, Bolton) or a Brampton variable pulley.

A Magneto Query.

Will you kindly answer the following question? How can one tell whether a magneto requires re-magnetisng or not, and would there be misfiring at low speeds, and rather difficult starting if the magneto were run down?—J.B.

If you find difficulty in starting and the machine misfires at slow speeds, provided that the plug and platinum points are adjusted properly, and that the magneto is otherwise in good order, you may take it that the magnets require re-magnetising.

Engine Fails to Start.

Being a reader of *The Motor Cycle* I am asking if you would be kind enough to let me know the reason why I cannot get my engine to start. It has been standing still for about two months as the result of having a mishap to the front forks. I have now got them replaced, and I cannot get the engine to work; it is an 8 h.p. twin. Before I had a mishap it ran beautifully. I had the forks put temporarily right so as to get home, then I took them off and had them repaired properly. The engine works freely, and I have put some petrol in the cylinder, and it fires through the silencer and sometimes comes through the carburetter. I find I have a leakage where the jet screws up. Would that stop the petrol from going to the cylinders?—W.J.T.

The leakage where the jet is screwed in should be stopped, of course, but this should not cause the engine to misfire. Possibly the float needle is stuck up and causes flooding, the very strong mixture resulting might cause the trouble, but we suspect wrong magneto timing.

READER'S REPLY.

Paraffin as Fuel.

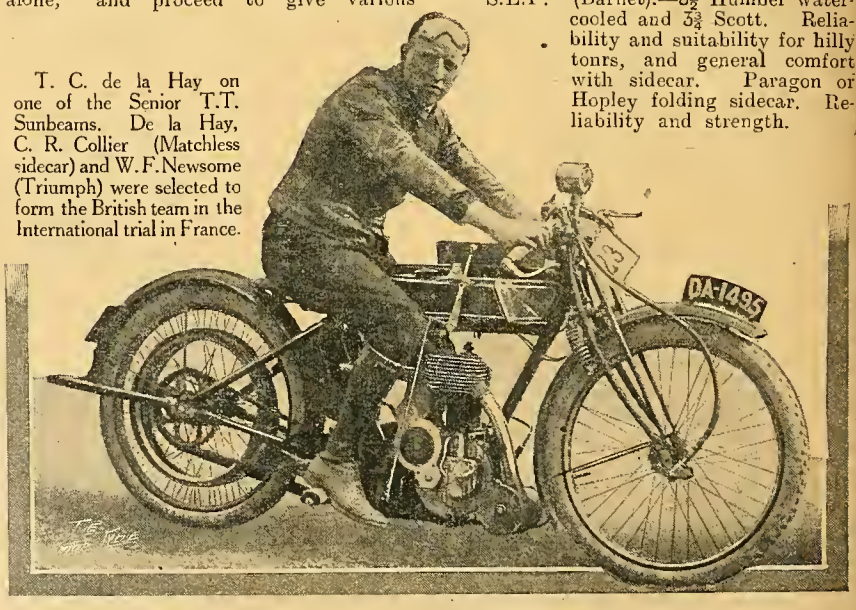
In your issue of July 16th, under "Questions and Replies," in answer to a question by "F.W.J.," you say "a machine could be run on petroleum alone," and proceed to give various objections to its use. About eighteen months ago I thought I would try paraffin as a fuel for my 1908 3½ h.p. P. and M., which was then fitted with a B. and B. carburetter with adjustable jet. I had a small extra tank fitted, for petrol, and always started and stopped on petrol; the latter so as to have a clean carburetter for starting. As a test for consumption, I may say that in 1912 I travelled on a trip, 750 miles with sidecar passenger (10 stone) and luggage, and averaged 70 m.p.g. on petrol alone, same carburetter; in 1913, with same passenger, equivalent luggage but heavier sidecar body, I did 350 miles on paraffin, with very little petrol for starting and stopping, and I averaged 100 m.p.g. Provided one finds the right amount of extra air to give, the "violent sooting" you mention is "*non est.*" I found the cylinder as clean after paraffin as after petrol. The engine is as lively on paraffin and not sluggish, as you suggest, and I have not had it "knock." As for violent smoking, you can make it do that easily by closing the extra air inlet, but not otherwise; and the smell from the exhaust is no worse than from petrol, as I found out by riding slowly in front of a cyclist (stranger), and asking him if he could tell me what I was burning. He could tell no difference, and proved on acquaintance to be a motor cyclist. The whole secret lies in getting total combustion. The only drawback you mention with which I can agree is with regard to its powers of "creeping." I have not tried your suggested mixture of one of petroleum to five of petrol, as I have been quite satisfied with plain paraffin at about 8½d. per gallon.—F.S.D.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.N." (London). — 8 h.p. W. C. Williamson sc., wear of tyres, m.p.g.

"S.L.P." (Barnet).—3½ Humber water-cooled and 3¾ Scott. Reliability and suitability for hilly tours, and general comfort with sidecar. Paragon or Hopley folding sidecar. Reliability and strength.



T. C. de la Hay on one of the Senior T.T. Sunbeams. De la Hay, C. R. Collier (Matchless sidecar) and W. F. Newsome (Triumph) were selected to form the British team in the International trial in France.

SUN MOTOR CYCLES.

Models from 6 h.p. twin J.A.P. to 2½ h.p. Sun-Villiers two-stroke.

Two convincing Testimonials (entirely unsolicited) to the great efficiency of "Suns."

Bexhill-on-Sea, July 2nd, 1914.

Dear Sirs,

As I shall sooo have had my Sun-Villiers a year, I beg to inform you that it is going strongly, and that the only fault ever found with it was on June 17th last when a Brighton Policeman said it was going too fast ! !

Yours truly,

HENRY BOURNE, J.P.

Mayhole, May 21st, 1914.

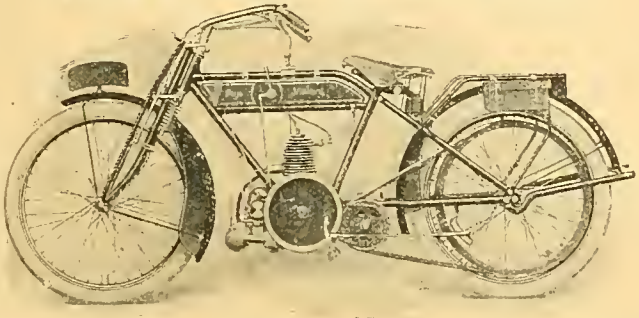
Dear Sirs,

I have now had an opportunity of giving the Sun 2-stroke motor a good run of over 80 miles, and am pleased to say as far as running is concerned it quite comes up to expectations, it has a great turn of speed, and simply romped up difficult hills.

Yours truly,

HUGH B. McFADYEAN.

We are the largest makers in the world of two-stroke Motor Cycles.



Sun-Villiers 2½ h.p. two-stroke single speed, 25 guineas.

6 GOLD and 2 SILVER MEDALS

were awarded to riders using the

JOHN BULL Belts and Tyres

in the severest trial in the history of the pastime—the

A.C.U. SIX DAYS

Note that, as also the testimony of two such gold medallists—

First—Mr. W. P. Tippett writes—

"I attribute my success in the A.C.U. 6 Days "to being free from tyre and belt trouble. "At the end of the trial the condition of the "JOHN BULL Tyres and Belt was splendid, "and several competitors using other tyres "agreed that no other make of tyre that they "had examined had stood the gruelling as "well as mine. I did not spend a moment on "them, no punctures, and no belt trouble, "thus easily gaining a gold medal."

Second—Mr. Graham Price, whose letter is as follows—

"In the A.C.U. 6 Days I used one Belt only "throughout the whole of the trial the JOHN "BULL, and it is still in perfect condition "notwithstanding the fact that I was riding "the heaviest and most powerful solo machine "to complete the trial; considering therefore "the immense strains imposed on the trans-"mission in ascending and descending terrific "hills day after day, I think the behaviour of "the JOHN BULL immense."

And having noted, let us send you details of the BELT WITH THE DEEP DRIVE, and the COMPRESSED RUBBER TYRES—the only tyres with a proved average back wheel mileage of 4,996 miles.

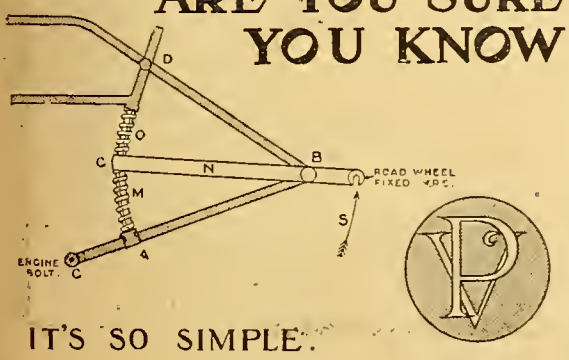
ARE YOU SURE YOU KNOW



IT'S SO SIMPLE.

the working of the **P.V. SPRING FRAME?**

If not, read this.

It does not hinge at **A**, this point being absolutely rigid, as are the points **C** to **A**, **A** to **B**, **D** to **B**, and **D** to **A**—in fact, the whole of the shaded part is in one piece. **B** is the point where the road wheel is fitted on rigid machines. This shows that the P.V. has all the advantages of the rigid type frame as regards stability.

At the point **B** the only working bearing is situated. On this bearing point oscillates the springing arm **N**, which extends from **F** to **G**, at which point it encircles the radius tube of frame, back again to **F** on the opposite side. A shock spring **M** and a recoil spring **O** also encircle this tube as shown. It can now be clearly seen that all shock (road unevenness) as directed at ⟶ **S** is absorbed by spring **M**, counteracted by **O**, and damped at **G**.

This explains the principle of the P.V. Spring Frame, which four years' road test and its constant successes in Trials proves far ahead of all others.

THE E.S. MYERS BRADFORD

"MYERS" SIDECAR

(SCOTT'S PATENT)

is made especially for the SCOTT machine, and the two combined make an ideal combination, giving complete immunity from vibration and road shocks.

The **"MYERS" SIDECAR** is the only one that is scientifically correct. Not a bent tube, and every one either in compression or tension.

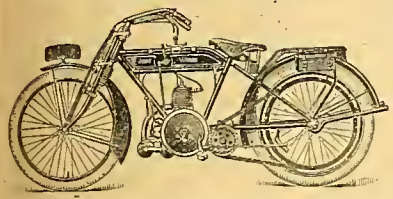
"JUNO" MOTOR CYCLES AND SIDECARS

ARE THE VERY BEST.



One of the many testimonials from riders of Juno Motor Cycles.

SILVER MEDAL AWARDED.

W. S. Capstick, Esq., 620, Manchester Road, Bradford, writes: 22nd July, 1914.

"I have been awarded a Silver Medal in the Bradford M.C.C. Speed Trial, on Blubberhouse Moor, Harrogate (Handicap) with JUNO 2-STROKE, with a speed of just over 38 miles per hour. The machine will really do more, I have got 49 out it several times."

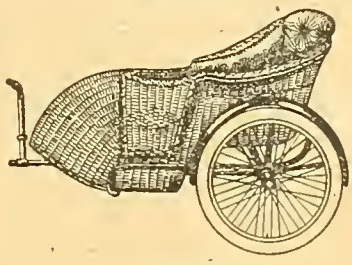
MINERVA, 1913, 3½h.p., Bosch, 2-speed, sidecar, luggage carrier, complete spares, brand new studded tyres, perfect condition; £22/15; trial.—F. Bryant, Park Lane, Kersal, Manchester. [X7308

"PERFECTION SIDECARS"

To suit all makes of machine.

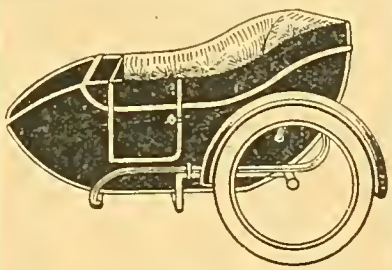
Prices from **£5 5 0.**

Full illustrated catalogue giving full particulars on application.



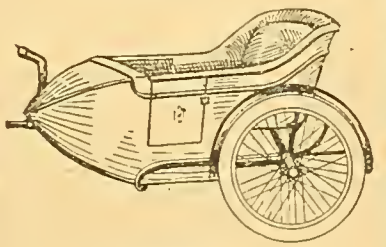
MODEL B.

Best chassis, with dropped frame, extra strong spindle, "Perfection" quick-detachable joints, three-stay side mudguard, 26×2¼in. "Avon" non-skid tyre, body: Well upholstered, with side door, with base and sides lined for passenger's comfort **£6 5 0**



MODEL E.

High-grade coach-built body, luxuriously upholstered, spring cushion, cupboard in front and under seat, side pocket for tools, spares, etc., 26×2¼in "Avon" rubber-studded tyre Standard finish: dark green, blue, or French grey **£10 5 0**



MODEL F.

Special coach-built torpedo model in three-ply wood, drop frame chassis, light and strong, cupboard with lock under front, spring cushion, and coach painted to any colour desired .. **£10 0 0**

CLEARANCE LINE OF NEW SIDECARS.

"SUPERBE" £6 6s. Sidecars, well upholstered, fitted with cushion, Avon non-skid, or Continental tyre. To fit all leading makes. Twelve months' guarantee .. .. .. Reduced to **£4 9 6**

For List of New and Second-hand Motor Cycles, see last week's issue of "The Motor Cycle."

COLLIERS MOTORIES,

WESTGATE, HALIFAX.

MOTOR CYCLES FOR SALE.

M. and M.

CATALOGUES of the new M. and M. 2-stroke at £25 on request.—Morgan and Maxwell, 80, High Rd., Streatham. [X5712

M.M.C.

M.M.C., 3½h.p., B.B. carburetter, mag. ignition, Brooks B100 saddle, good value, £16/10, or on E.P.S.—Lamb's, 151, High St., Walthamstow. [6107

Moto-Reve.

1911 Moto-Reve, horn, tools, spares, perfect; £9.—W. Hilton, Fourth Av., Blackpool, S. [X7284

Motosacoche.

£9/10.—1¾h.p. Motosacoche, fine condition, h.b.c.; bargain.—58, Blagdon Rd., New Malden. [6027

1913 Motosacoche Lightweight, brand new machine; £25; cash or easy terms.—R. E. Jones (Garages), Ltd., Swansea. Also at Cardiff. [0548

1912 Motosacoche, 2½h.p., variable gear, lamp, horn, pump, etc.: first cheque £18; going abroad; all particulars.—Box 6,530, *The Motor Cycle* Offices, Coventry. [X7200

New Hudson.

1913 New Hudson, 3-speed gear, coachbuilt sidecar, lamp, horn, all spares, new condition; £45.—Plastow, Grimsby. [X7292

NEW Hudsons.—6h.p., 1914 models; 68 gns.; exchanges or easy payments.—Maudes, 136, Gt. Portland St., London, W. [8363

NEW Hudson, 1913, 3½h.p., 3-speed, lamp, horn, and tools, guaranteed sound; bargain, £38/10, or near offer.—Shuker, Shrewsbury. [0541

NEW Hudson, 6h.p., 3 speeds, almost new, only used about 1,300 miles, complete with fitments and sidecar; £70.—Turpins, Preston Rd., Brighton. [0511

NEW Hudson, late 1912, 3½-4h.p., 3-speed, sidecar, speedometer, lamp, horn, spares, not run 2,500 miles, perfect order, ready for touring; £45.—J. Ames, Huntriss Row, Scarborough. [6017

NEW Hudson Lightweights, promptest delivery; E.P., quarter down and balance in 12 monthly instalments.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [6115

1912 New Hudson, 2½h.p. J.A.P. engine, 3-speed gear, new Palmer cord cover back, studded front, B104 saddle, very good condition; £21.—Robinsons, Green St., Cambridge. [0523

NEW Hudson, 3½h.p., single-cyl., 3-speed Armstrong gear, and Speedwell coachbuilt sidecar; this combination is equal to new in every respect; £50 secures.—Colmore Depot, 31, Colmore Row, Birmingham. [X7184

New Imperial.

1914 New Imperial-Jap, brand new, 8h.p., 3 speeds, car tyres; cost £77; delivered too late; will sacrifice for £67.—125, London Rd., Manchester. [0563

New Ryder.

NEW Ryder.—Sole London agents. Immediate delivery from stock. Single speed 25 gns., 2-speed £33. No extra for easy payments.—Mills Motor, Ltd., Wood Side Parade, North Finchley. 1745 Finchley. [0572

Norton.

1914 3½h.p. 3-speed Norton, equal to new, ridden only 400 miles, complete with P. and H. lamp, horn, etc.; £50.—Parker and Son, St. Ives, Hunts. [0496

N.S.U.

BARGAIN List

ONE 2h.p. N.S.U. Single-cyl. Lightweight, complete with 2-speed gear and free engine, 1913 model, shop-soiled; £30 net.

ONE 3h.p. N.S.U. Twin-cyl. Motor Cycle, complete with 2-speed gear and free engine, 1914 model; £32 net.

ONE 3h.p. N.S.U. Twin-cyl. Motor Cycle, complete with under-geared pulley, 1912 model; £25 net.

ONE 3½h.p. N.S.U. Single-cyl. Motor Cycle, complete with h.b.c. 2-speed gear and free engine, 1914 model, shop-soiled; £48 net.

ONE 6½h.p. N.S.U. Twin-cyl. Motor Cycle, complete with 2-speed gear and free engine, 1913 model; £45 net.

ONE 8h.p. N.S.U. Twin-cyl. Motor Cycle, complete with 2-speed gear and free engine; £25 net.—Box L5,421, *The Motor Cycle* Offices, 20, Tudor St., E.C. [0538

TWIN N.S.U., 6h.p., Bosch, N.S.U. 2-speed, F.E., fine sidecar machine; bargain, £17.—Speechley, 45, Church Rd., Acton. [6125

N.S.U.'s in stock, immediate deliveries; exceptional terms. Write to us and you will save money.—Parker and Son, St Ives, Hunts. [0498

N.U.T.

EARLIEST deliveries of the famous N.U.T.—The West Lancashire Motor Co., Ltd., Southport. [0556

N.U.T., 2¾h.p. T.T., 1914, single geared, as new; best offer secures.—W. S. Life, 10, Cumberland Rd., Southport. [0573

The Motor Cycle in Warfare.

MOTOR cyclist despatch riders are to play an important part in the present war. That this would be the case was obvious before the crisis came. The Government took a long time before it would look with favourable eyes on motor cycles and realise their potential uses, but the value of motor cyclist despatch riders in the event of railway lines, telephones, and all other means of communication being out of action cannot be overestimated. Every opportunity has been seized in the past to impress upon the Government the immense value of the motor cycle in time of war, until, a few years ago, a small section was employed in the Army Manœuvres; the following year the number used was more than trebled, and the military motor cyclist having time and again proved his worth in no uncertain fashion, the Government has gone on multiplying the numbers and extending their uses in various directions, notably in the flying corps and transport service. All this is a feather in the cap of motor cyclists, manufacturers, and all others directly connected with them, as the success of motor cycles in warfare is simply and solely due to their present-day reliability. But the fact of motor cyclists being attached to the Army is not the only pleasing feature in this crisis; indeed, we know of nothing more encouraging than the patriotic response of motor cyclists to the call of their country. Hardly had the order for the general mobilisation of the Army been issued and the request for motor cyclist volunteers made than every vacancy was filled and thousands have since been refused.

The appeal by *The Motor Cycle* in the last issue for volunteers met with a most encouraging response. Each day scores of replies were received from readers offering the services of themselves and their machines, and these answers were at once handed to the secretary of the Auto Cycle Union, which body has placed its services and the whole of its staff at the service of the War Office authorities, and the names and addresses of those who offered their services have been classified into the counties and districts in which they reside, which list is now at the disposal of the War Office when further volunteers are required.

Last week Midland manufacturers received repeated orders from the Government for motor cycles; the War Office officials immediately on the outbreak of hostilities took details of the stocks held by the different firms, and have since acquired a large number of machines.

The Noise of Two-stroke Engines.

NOW that the two-stroke engine is so rapidly increasing in numbers and popular favour, it is interesting to draw attention to a curious feature which we have not seen emphasised elsewhere. By this we mean the curious drumming noise which many of the engines emit. This noise is quite distinct from exhaust sound, and is generally heard more distinctly when a machine is approaching than when it has past. There are many possible theories, but probably the sudden opening and cut-off of the ports is in a large measure responsible, for, at the high speed at which most small two-strokes run, the piston speed, and consequently the port openings, are exceedingly rapid. It would be instructive to hear the effect of various port shapes on this noise from such as have experimented in this direction. It has been suggested that the increased speed of the magneto chain might possibly have some bearing on the question, and it is possible that the stream of exhaust gases striking the silencer walls, quite apart from the final exhaust note, is to some extent responsible in certain designs. The silencing of the final exhaust is also a question of importance, for two-cycle engines will not stand a throttled exhaust, and consequently great care must be exercised in silencer design if quietness is to be obtained. It should be possible to make a two-stroke quieter than almost any other type of engine on account of the small number of moving parts.

A Lady's Record Ride in Lakeland.

By GEORGE D. ABRAHAM.

HONISTER Pass has been climbed by a sidecar driven by a lady. "How are the mighty fallen!" some might say, with exciting memories of a few years ago when experts on special mounts hardly achieved the ascent.

To Mrs. Mary Riley belongs the honour of being the first lady to cross the notorious pass on a motor cycle and sidecar from the Buttermere side. *En route* for a sidecar camping holiday in the Highlands with her husband and young son, she encountered two other sidecar parties at Kendal who were bound for a special test on Honister Pass (these were W. H. Carson and F. C. North on a 6 h.p. Excelsior and a 6 h.p. Ariel respectively), and persistent rumours of the petrol famine in the far North induced the lady's party to vary the route by travelling to watch the experts climb Honister. It was a fortunate plan, for the quickly developing war news made the distant journey inadvisable. A camping holiday in Lakeland provided an excellent substitute.

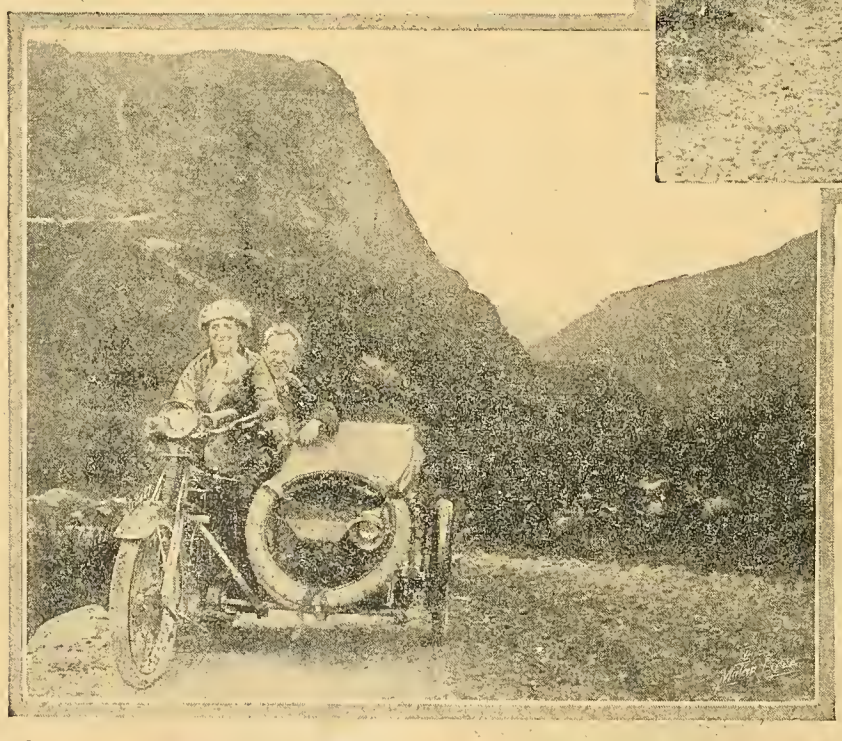
The approach to Honister was made on a day of excessive moisture—which means much in Lakeland—by way of the Devil's Elbow and Buttermere Hause. At Buttermere, during the lunch interval, the two-speed 6 h.p. Enfield with its 9 to 1 low gear received attention. A special sprocket was carried, and this was put on to bring the gear down to 12 to 1. This was a necessity considering the work on hand and the heavy load to be carried.

Then, having watched the others struggle up the slippery Hill Step, the lady rider was tempted to try the ascent. Doubtless a sight of the skilled ascents by the others assisted in the attack, for Mrs. Riley made a non-stop climb at the first attempt despite the bad weather conditions. Only once did the passenger, who rode mostly on the tool box, feel any misgivings. This was on the rocky 1 in 3½ section of Hill Step—the crux of the climb. There the spinning driving wheel failed for a moment to find a grip; a crosswise skid almost flung the machine over into the torrent-filled gorge on the right.

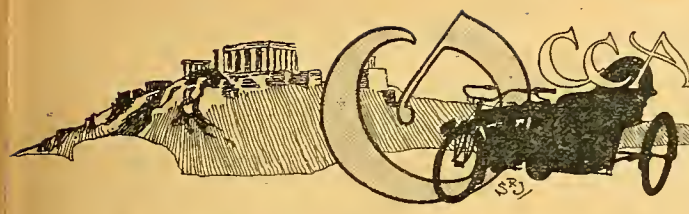
Some might say absence of body is better than presence of mind at such times, but this was not the opinion of the indomitable lady rider. With fine judgment and perfect skill she caught the firmer surface at the right moment, and with a roar the Enfield dashed upwards. The top of the pass was soon under wheel. Then, as though yet unsatisfied, the sharp hairpin to the left was suddenly taken, and a finish made at the Yew Crag slate quarries, some few hundred feet above the Honister Hause.

It was altogether an astonishing performance, but one which few lady riders should emulate. Mrs. Riley and her Enfield are a strong combination, a fact which recent competitions have accentuated.

Up out of the depths of Hill Step. The foot of Honister Pass is seen some seven hundred feet below.



"The Winning Smile." The 6 h.p. Enfield after the remarkably successful climb to the top of Honister Pass from Buttermere. Mrs. Mary Riley is the first lady motor cyclist to make the ascent.



OCCASIONAL COMMENTS

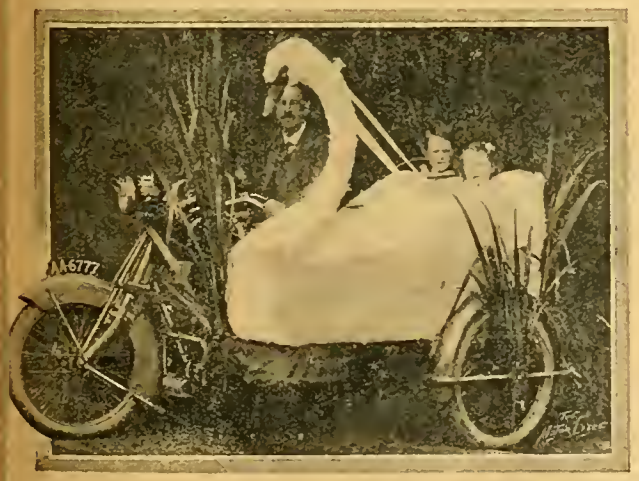
BY "IXION"

Reproved!

A friendly Yorkshireman informs me that exhaust valve springs are easily tied up with string, if the twine is interwoven through some of the coils. Obviously I regret, dear friend, that ere I reached the twice and string stage most of my brains had temporarily perspired away. The breath of moorland air which your letter brought has done me good, and my spring removing tool is now chained to the garage wall.

Mechanical Hooters.

So far as cycle cars are concerned, I believe I have solved the question of far-sounding alarms. I do not love the exhaust whistle, because of its sooting propensities. I hesitate in the face of electric alarms, because they demand big batteries, which are costly to buy and soon need recharging. The pneumatic hooter does not carry far enough, and its delicate reed chokes too often on dusty roads. So for cycle car work I pin my faith either to a pneumatic alarm, operated by a pump driven by friction off the flywheel, or to one of the new mechanical alarms, in which a rack-handle and intermediate gearing rotate a toothed wheel with great velocity against a diaphragm. To neither of these have I found any objection in use. Some of the latter, in particular, are now made in very light weights. My new Blériot mechanical horn is of very imposing appearance, and its full shriek is guaranteed to awake the seven sleepers; but it only weighs 3 lb., and therefore is not quite outside the pale of motor bicycling possibilities. If a very little more work is devoted to reducing the weight and dimensions of such accessories they will be completely suited to heavy touring motor cycles.



A prettily decorated Clyno motor cycle and sidecar, "The Swan of Avon," which won first prize in a procession recently. It belongs to Mr. C. J. Eldridge, of Fordingbridge.

The New P. and M. Twin.

I am very specially interested in the new P. and M. engine, as the 90° twin has been one of my pet foibles for many years past, though of late the horizontally opposed twin has rivalled it in my affections. My comparisons between the two types may interest readers. I have found that the 90° twin is usually the steadiest slogger at low engine speeds, but that equality of lubrication is easier to obtain on the horizontal type. There is no question that either pattern is infinitely preferable to the 50° or 60° twin on all outfits which are asked to do much "free engine" running. It is unfortunate that neither pattern is easily housed on cycle car or motor bicycle frames without some sacrifice of accessibility or aspect, and I await the detailed study of the new P. and M. in the latter respect with considerable interest. The excellent balance of a 90° twin makes it an eminently suitable engine for motor cycle purposes.

A Racing Cycle Car.

The qualities of the racing engine of to-day will be transferred, they say, to the touring engine of to-morrow. It has always been so. I have been very busy lately—I will not say "driving" so much as hanging on to the wheel of a racing cycle car, and it has marvellously strengthened my optimism anent the future of the miniature four-wheeler. Much as I love a good cycle car or light car, I feel sore when I approach some long easy slope, up which I have been accustomed to roar at any speed from 30 to 50 m.p.h., according to circumstances, on my motor cycles; I take the biggest rush I can get, and my little car is doing a very noisy and vibratory 40 m.p.h. at the take-off, which rapidly slows to 15 m.p.h. after a hundred yards or so. Down I come to second gear, accelerate up to 20 m.p.h., which represents perhaps 66% of the maximum r.p.m. available, and then curb the roaring engine down in the interests of longevity. Motor cyclists on antediluvian 500 c.c. singles, and even on modern babies of 250 c.c., shoot scornfully past me, and even if it is raining, and they are wet and mud-plastered, I envy them. My little racer has comforted me. I never let it exceed 40 m.p.h. because it only weighs 1,000 lb., and even at double legal limit it is inclined to proceed like a frightened hare in a series of sighting hops. But it takes all those tiresome slopes on top gear at 30-40 m.p.h. if the road is empty, and its acceleration from a standstill would be equal to that of most motor cycles, if wisdom did not suggest letting the engine die clean away when changing from first to second and second to top. In the near future all cycle cars will have lively, vivacious engines of this character (the Manx T.T. will lay the foundation stone of this advance), and as the trade concentrates into fewer and larger factories, prices should fall a little. Make no mistake, cycle cars are going

Occasional Comments.—

to boom before so very long, and driving a cycle car is going to be much more reminiscent of driving a high-powered motor cycle than it has been. When I say "cycle car" I imply nothing about design; but I fancy that the stereotyped designs of the future will own a closer kinship with motor cars than with motor cycles. Let us hope that the Cycle Car T.T. will become an annual event. If any firm of cycle car or light car manufacturers builds up a reputation for combining fast acceleration, high speed, top gear climbing, and real reliability in its standard models, the demand it experiences will astound it. At present the number of riders who have sampled the Brooklands type of cycle car engine does not exceed fifty or so; and the sluggishness of most standard touring chassis chills the ex-motor cyclist's enthusiasm. Wait till the qualities of to-day's racing engines are transferred—with a little refining down—to the touring chassis of to-morrow!

Our Latest Critic.

I have just been reading Mr. H. G. Wells's latest combination of political prophecy and scientific romance, entitled "The World Set Free." It is somewhat topical, as it is an attempt to picture the final European war, in which the slaughter is so appalling that national monarchies are abolished in favour of a world-republic. The chemical discovery which is responsible for the slaughter is, incidentally, applied to the perfection of the motor cycle. The "filthy oil-driven motor cycle" gives place to light shimmering steeds of silvered steel, driven by a radio-active compound, which emanates a permanent explosion, and is used in engines invented by a Bengali. As one of these motors will drive a family motor car thirty-seven miles for 1d., the lightweight of the future is evidently to be contemptibly economical. One presumes that only tramps will venture to be seen on them, and the "knuts" of that era will doubtless prefer a pocket folding aeroplane.

Petrol Consumption on Small Twins.

I see that the A.C.U. does not trouble to verify petrol economy — or extravagance — in its trials. Rather a pity, I fancy. I have no doubt whatever that most manufacturers grossly exaggerate the mileage of which their engines are capable. It is very seldom indeed that a standard $3\frac{1}{2}$ h.p. machine, as delivered to me by its makers, is equal to more than 70 m.p.g., and the small high speed twin-cylinders sop up the costly spirit at the most alarming rate. I am using a small and speedy twin for runabout work, and, though I fancied it required tank replenishment somewhat frequently, I never suspected the depth of its iniquity till I lent it to a friend for a long week-end. In returning it, "Do you know it only does 57 m.p.g.?" quoth he. Verification followed, and the awful accusation was proved. This mileage is registered at about 28 m.p.h. average speed. At a legal limit average the engine can do 73 m.p.g.—no more! It is in good tune, with all joints tight, and standard carburetter adjustment. Are most 350 c.c. machines similarly sinful? [They are not.—ED.]

CHAIN OR CHAIN-CUM-BELT?

The Claims of Two Popular Transmission Systems Critically Examined by "Road Rider."

ANY close student of contemporary design must notice that the leading designers of high-powered sidecar outfits are divided into two schools. The all-chain drive has been steadily growing in popularity, but a significant and stubborn minority adhere to the chain-cum-belt drive. I have spent a great part of the current season in testing these two designs, one against the other, with the aid of a good variety of first class machines, and am inclined to form the following tentative conclusions.

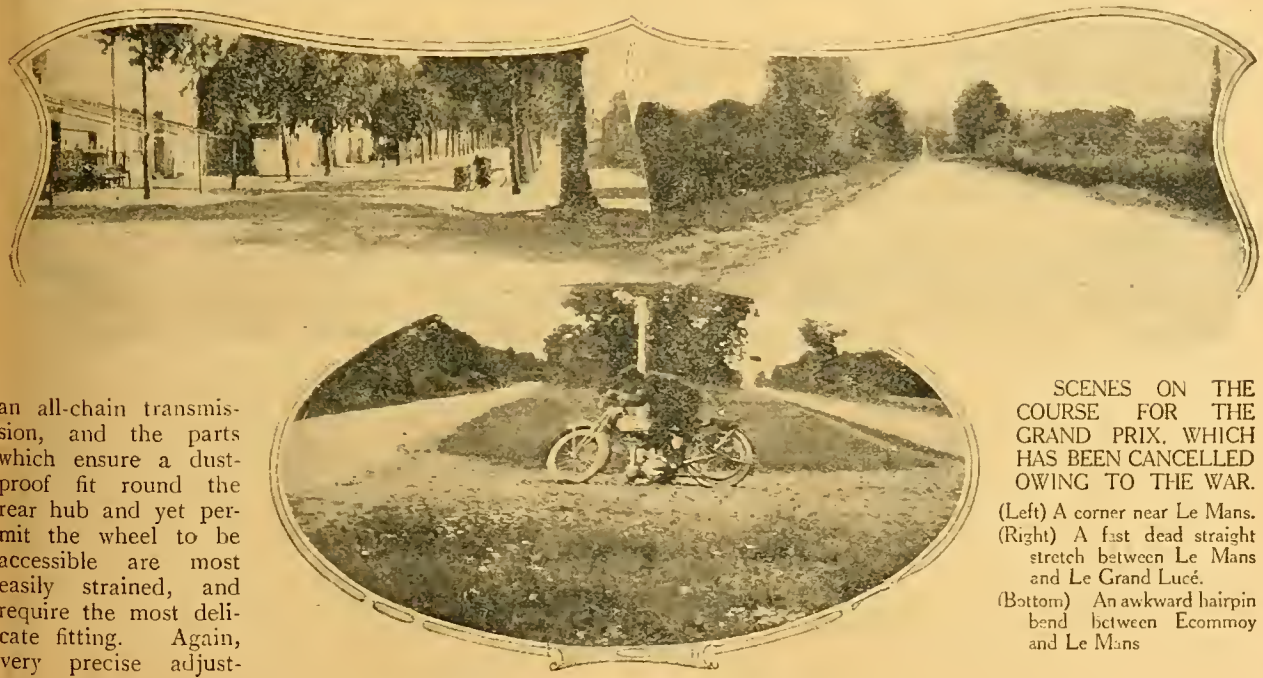
The superior smoothness often claimed for the "combined" drive is almost fictitious. During the last week I have driven two high-powered sidecar outfits, one with all-chain and one with combined drive. Both drives "snatched" to about the same extent if one attempted to pick up from a crawl on top gear; both drives were absolutely silky as soon as the machine got into its stride. At fifteen or twenty miles an hour the physical sensations failed to inform one whether the transmission was by chain, belt, or combination of the two. I personally consider that there is very little slip in the belt portion of a combined drive; the two big pulleys seem to afford a drive that is practically rigid. The combined drives *can* be softened to eliminate all snatch when accelerating from a crawl; but this can only be effected by slackening the belt to such an extent that it is liable to slip at higher rates of revolution when the pulleys are wet, or when a stiff gradient is being climbed. If the belt is properly adjusted, the drive shares the slight but perceptible snatch common to the all-chain drive.

Secondly, it cannot be denied that the combined drive has a marked superiority from a user's point of view. The final belt drive makes the removal of the back wheel a much cleaner and simpler operation than it is with either enclosed or naked rear chains. The rear chain case is always the most finicky detail of an all-chain transmission, and the parts which ensure a dust-proof fit round the rear hub and yet permit the wheel to be accessible are most easily strained, and require the most delicate fitting. Again, very precise adjustments of the length and alignment of the rear chain are essential, and a rear belt is less exacting both in length and lining up.

Thirdly, the combined drive seems superior from a manufacturing standpoint. The last point cuts both ways. The maker sells quite half his output to duffers. The more his design is fool-proof the less trouble he will have with clients, both directly through factory visits and correspondence and indirectly through his agents. Again, the manufacturing cost of the combined drive is distinctly lower than that of a fully encased all-chain drive, though there may be very little in it with the naked chains. He saves the cost of the rear chain case, which includes a number of parts requiring the most accurate fit and finish. He saves the cost of an extra belt rim for braking purposes, and simplifies the design of his rear brake control gear. He saves the cost of a cushion hub, and so on. It is true that the combined drive may deliver a fractionally less percentage of the engine power at the rear wheel when the machine is brand new; but it will deliver exactly the same percentage in three months' time, whereas the efficiency of the chain drive will have dropped considerably in that time.

The cost of upkeep of the two transmissions is similar; if anything, the advantage is in favour of the combined drive, for a new chain really demands new sprockets, whereas a new belt does not imply two new pulleys. The reliability factor of the two systems, I am satisfied, is equal even in skilled hands; and in unskilled hands, where chains are run slack, adjusted out of line, and broken by failure to adjust for "the tight spot," not to mention the possibility of wrenched and strained chain cases, the belt is probably distinctly more reliable.

On the whole, therefore, I feel that the advantages of the combined drive are irresistible at present.



SCENES ON THE COURSE FOR THE GRAND PRIX, WHICH HAS BEEN CANCELLED OWING TO THE WAR.

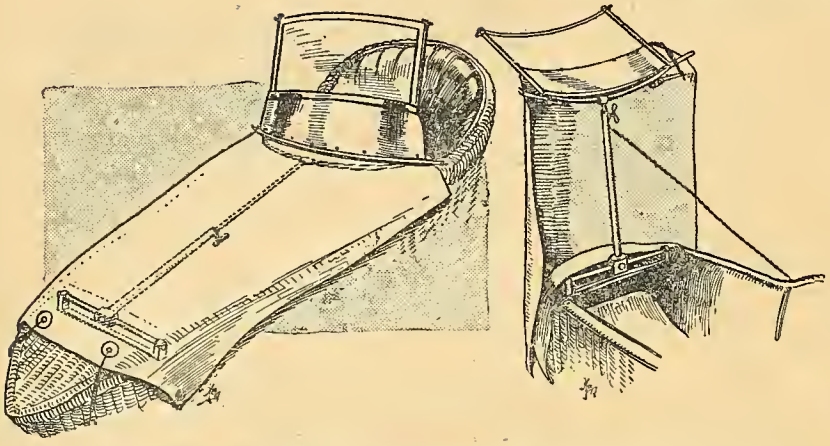
TWO NEW SIDECARS.



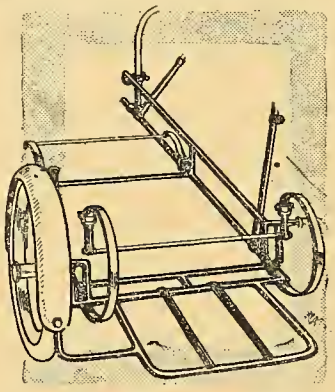
The County sidecar screen shown in position on the left, and on the right folded out of position to allow entrance to the sidecar.

THE COUNTY SIDECAR SCREEN.

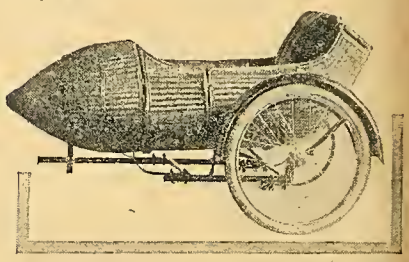
We were recently afforded a run in a sidecar machine belonging to the County Works and Garage, 3, Guildford Street, York Road, S.E., which was fitted with a novel type of wind screen, made to the design of Mr. C. Scott-Snell, A.I.A.E., A.M.S.E. The sidecar to which this fitment is attached is a Gloria, and the appearance of this is in no way impaired. A careful perusal of the accompanying illustrations will give a good idea of the method of working and construction. Should a child be carried in the toe of the sidecar the screen can be pushed right forward, or it can be locked in any intermediate position. Again, the height is adjustable, a point which must be considered in inclement weather, and any water which drains off is carried away in a little gutter. Care has been taken to design the celluloid protection with a curve so that distortion, which is so common in flat sheets of this material, is eliminated.

SIDECARS AT PURCELLS.

The sidecar chassis made by Purcells, Ltd., 74, Charlotte Street, W., are very neat in appearance, and unusually strong, as welded joints have superseded the common brazed lugs. Special provisions are made for mounting the mudguard rigidly, and the stays themselves are made in large section and held in position by nuts, which can be screwed up securely without fear of stripping threads. Again, the bracket to which the main stay is anchored is made of a very good quality malleable cast iron, the great property of which is toughness. It can therefore be seen that all chances of worry caused by the rattle of a loose mudguard are eliminated. A twin axle pillar gives ample support for the spindle, which is made of special grade steel, and welded into the axle tube. Luggage and petrol carriers are embodied if desired. Another special product of this firm is the double-seated sidecar, the chassis of which is provided with two separate sets of springs. One cannot visit Purcells without admiring their fine selection of bodies. We have tried personally the riding and springing of their sidecars over very bad roads, and found them to be excellent in every way.



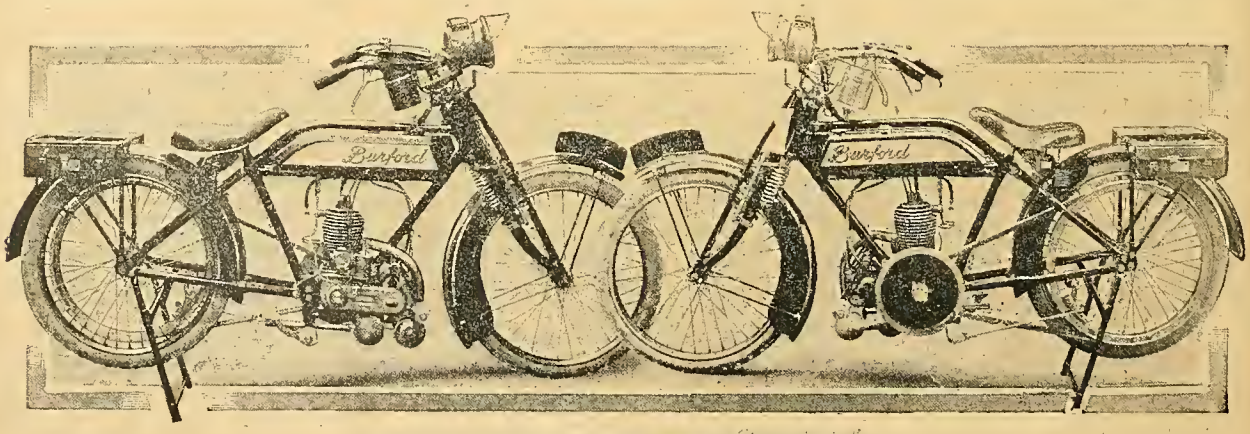
The sidecar chassis made by Purcells, Ltd.



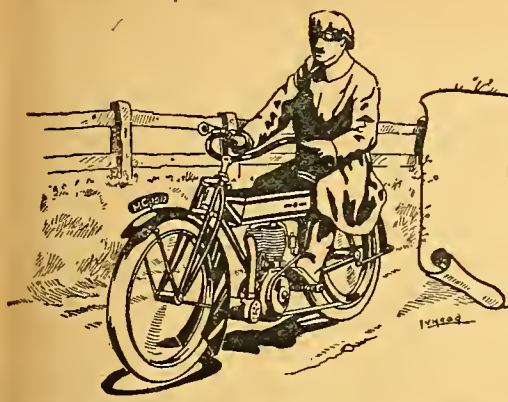
The cane sidecar marketed by Purcells, Ltd.

BURFORD TWO-STROKE.

A neat little two-stroke lightweight which we recently examined is the 2½ h.p. Burford, sold by the Automobile Consolidated Alliance, Ltd., 1, Albemarle Street, W. The model shown is single-geared and is fitted with a 2½ h.p. Villiers engine, to which a Senspray carburetter is attached. It has an excellent frame with a dropped top tube, a strong stand, excellent mudguards, a substantial carrier, and a good tank fitted with a hand pump for delivering oil into the petrol in the proportion of two pumps to half a gallon of fuel. It will be noted that the control wires are passed through the tank, and that two pairs of footrests are fitted, while in the photograph of the carburetter side of the engine the substantial pedal operating the foot brake will be noticed. A counter-shaft two-speed gear can be had to order; with this fitted the little machine should be capable of carrying its rider anywhere in reason.



Both sides of the 2½ h.p. two-stroke single-geared Burford.



CUTTING DOWN RUNNING COSTS.

Some General Hints on Economy.

FROM time to time letters appear in the motor cycling press from riders of solo machines or sidecar combinations giving details as to their running costs. The observant reader cannot fail to notice the inconsistent results obtained by owners of similar mounts, the figures given varying from something under a penny to, in some instances, double or treble that sum per mile. However, each rider seems to have prepared his accounts as accurately and conscientiously as possible. It is true that here and there such items as cost of tyres or belts have been omitted, whilst in some other letter a lamp, or speedometer, may have been charged against one year's use of the machine, and no allowance made for its end-of-season value which should be considerable. But these are minor errors which are easily detected, and the fact remains that some riders carry on their hobby much more cheaply than do others. With the rapid rise in the price of petrol which is taking place, running costs are certain to increase unless many economies are effected, and it is the object of the writer to show that these are possible without either cutting down the mileage run, or detracting in any way from the pleasure of the pastime. It is true that a more experienced rider can cut his costs down more than one who has but little practical or theoretical knowledge of his machine or the principle which underlies its working. But even the novice, by the exercise of care, can make considerable reductions in his running costs.

Three of the principal items which go to make up the cost of riding are fuel, tyres, and depreciation. Taking them in the order named, it may be shown in what way the cost of the former may be reduced.

Notes on Fuels.

Every motor cyclist knows that it is possible to run his machine on paraffin, but it is only occasionally that one meets a rider who has been bold enough to try it. It is true that paraffin has certain disadvantages. With its use carbon deposit is formed more quickly. It is also practically impossible to start up an engine from cold on paraffin without some primary heating device. But the experienced rider need take no notice of such difficulties. The taking down of an engine for cleaning purposes has no terrors to the man who knows what he is doing. All that has to be done to enable the engine to start is to shut the tap from the tank, drain the carburetter float chamber, fill it up with petrol from a handy bottle, and start up in the ordinary way, opening the tap as soon as the engine fires. The expert will be well aware also of the fact that there is a tendency for the paraffin to pass in globules to the cylinder, and that consequently a proportion of it may pass down between the rings and thin the lubricating oil. He will get over this difficulty by using as thick an oil as possible, and to do away with the cutting action of paraffin will oil up more frequently than if he were running on pure spirit. There is little difference between the mileage that can be obtained from a given quantity of petrol or paraffin, whilst the cost of the latter is about half that of the former, a saving of practically fifty per cent.

A Mixture of Petrol and Paraffin.

Admirable results can be obtained from a mixture of paraffin and petrol. There is little difference between running on paraffin alone and running on one-quarter petrol and three-quarters paraffin. A half-and-half mixture is admirable, the engine showing little tendency to overheat or become foul, and provided the fuel in the tank is well mixed before an attempt is made to start the engine, and the carburetter is drained and allowed to fill with the freshly mixed fuel or pure petrol, little or no difficulty will be experienced in starting from cold if the engine is primed beforehand. The reason why the fuel in the tank must be thoroughly mixed is that the paraffin is the heavier of the two, and so settles to the bottom of the tank during a lengthy stop. When on the road the vibration due to the road surface and the working of the engine keeps the contents of the tank properly mixed.

Even the man who fears to experiment to any extent with his machine need not hesitate about adding paraffin to petrol in the proportion of, say, one quart to three. He will then, according to the present prices, save about 2½d. per gallon, and be able to start up from the cold.

Economising in Petrol.

It is not only in the direction of using substitutes that economies can be effected in the cost of petrol. Many motor cyclists are careless as to the way in which they use the spirit, and a rider who takes every precaution can easily travel eight or ten miles more to the gallon than can the average man. He will buy his spirit in the two-gallon tins, emptying them into his tank himself, and will be specially careful when doing this. When spirit is bought in smaller quantities and emptied into the tank by the retailer it sometimes happens that the measure is not filled, and that not only is petrol spilled when carrying it from the shop to the machine, but a good deal is wasted when pouring it into the tank. If carelessly poured in, an airlock will form and a quantity of the spirit will be wasted. The use of a magneto cut-out for speed

Cutting Down Running Costs.—

instead of the throttle lever is particularly wasteful, as while the magneto is cut out, charges of valuable fuel are either being passed through or fired by heat in the silencer. There is also a tendency on the part of many riders to run on far too rich a mixture, instead of giving the engine as much air as it will take.

With machines fitted with free engine clutches, or multi-speed gear, the average rider is prone to waste petrol by allowing his engine to race, or, at any rate, to run too fast before the clutch is engaged. Frequent stopping and starting causes undue waste, as also does the tendency of many riders to use the low gear in traffic. Another form of waste is flooding the carburetter excessively every time the engine is started. In starting up from cold many riders do this until the sides of the float chamber and the air opening below the jet are dripping with petrol. As a matter of fact, as long as a few drops of spirit are thrown into the mixing chamber there is no need to do any further flooding, especially if a few drops of petrol, or preferably paraffin, have been injected into the cylinders. To restart after a traffic, or other short, stop there should be no need to have to flood the carburetter if the plug points are properly set.

When the cycle is garaged, or stopped for any length of time on the road, the petrol tap should be closed. Otherwise evaporation, particularly in warm weather, is taking place the whole of the time the machine is at rest. It is not an unknown thing for a petrol tap itself to be leaky or for a joint of either the carburetter or petrol tap union to be faulty. All these minor leakages will appreciably affect the mileage run per gallon of spirit.

Some motor cyclists waste a good deal of spirit during a day's run by using it for cleaning purposes. It is not an uncommon thing for a rider, after effecting some slight but uncleanly repair, to open a petrol tap and allow spirit to flow over his hands. Most riders when repairing a puncture use petrol to clean tube and patch. There is little or nothing to say against this course, although some would have it that the petrol has an injurious effect on the rubber, but it is well to bear in mind that the least possible quantity of petrol on a rag will suffice.

Good Driving Saves Tyres.

With regard to tyres, a good deal depends on the skill of the driver, a subject with which this article has no concern. A man who has "road sense," who can judge distances and speeds with accuracy, and who consequently uses his brake but sparingly, invariably has lower tyre bills than the careless or inexpert driver who is continually applying the brake to his back wheel. Incorrect inflation is detrimental to any tyre and it is better to err on the hard side.

At frequent intervals the covers should be examined and all stones picked out. This is work that requires to be done carefully; stones—flints in particular—often splinter into small razor-edged fragments which literally bury themselves in the rubber, and ultimately will cut through the canvas. All holes in the rubber caused by stones, etc., should be filled up with tyre stopping, especially if the hole reaches through to the canvas. In the latter case the cover should be solutioned inside, and a patch applied. After being allowed to dry, the back of the patch should be cleaned and solutioned and a piece of prepared canvas applied large enough to extend all round at least an inch beyond the edge of the patch.

Every now and then covers should be removed from the rims and the latter examined. Any dents should be taken out and all traces of rust removed with emery paper, after which the inside of the rim should be painted with a good quick-drying enamel, which must be allowed to dry thoroughly before the cover is again put in. It is hardly necessary to say that every motor cyclist should keep an exact note of the life of every tyre he puts on his machine.

Retreading Covers.

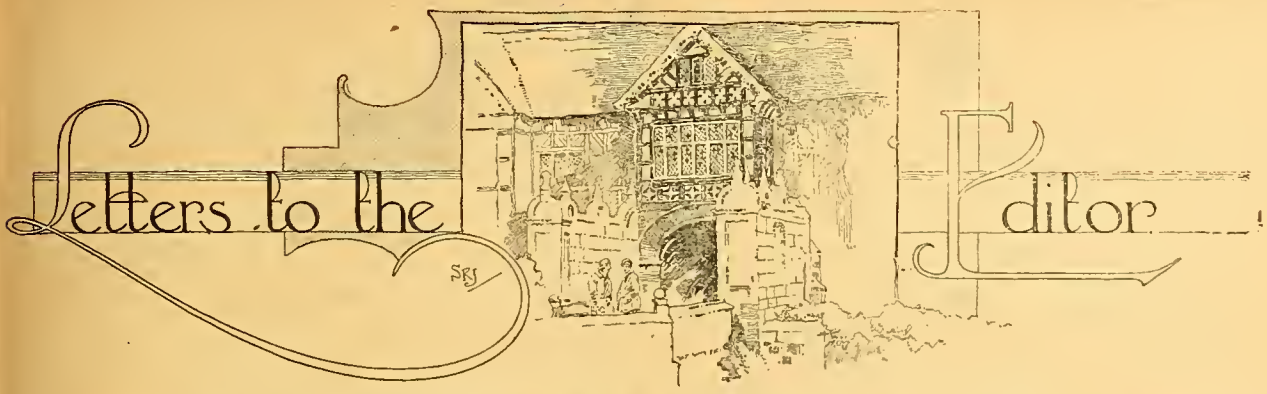
It appears to be a moot point amongst motor cyclists as to whether it pays to have covers retreaded. A good deal depends on the quality and condition of the canvas, as if this is damaged seriously or shows signs of decay through the admission of damp it is next to no good having anything much done to it. It might be retreaded by one of the many firms who do this work at extremely low rates, and used up on the front or sidecar wheel. But it is no use spending money in having an expensive retread put on the damaged fabric; nor, again, is it much use putting a retreaded cover on the back wheel of a heavy sidecar combination. But if the canvas is not damaged to any extent it will certainly pay to have a cover retreaded, in which case it is advisable to have the work carried out, if not by the actual makers of the tyre, by a firm with a high reputation.

As regards depreciation there is not a great deal to be said. The key to the whole matter lies in the care that is taken of the machine, not only whilst it is on the road, but whilst in the garage. By care on the road is not meant slow driving; a careless or inexperienced driver can do a great deal of harm to a motor cycle and yet never exceed eighteen or twenty miles per hour. On the other hand, a man can habitually drive at from thirty-five to forty miles per hour whenever the road is clear, and at the end of the season his mount may be as sound as a bell and in as good condition, except for a few scratches on the enamel, as when it left the factory.

Care of Engine and Machine.

The engine should be taken down periodically and thoroughly cleaned, worn bearings re-bushed, valves ground in, and tappets adjusted. No fault should be neglected; something "not quite right" that is left until a convenient time comes along for it to be repaired often develops into something almost irreparable. The most common source of engine trouble is under-oiling. Few motor cyclists err on the side of over-oiling, although over-oiling can do no harm whatever to an engine, provided that carbon deposit is periodically cleaned off. The only inconvenience it can give rise to is a sooted plug.

But it is only amongst the experienced that the condition of the engine is held to be a guide to its end of season value. The inexpert purchaser is taken generally by the cleanness and spick and span condition of the second-hand mount offered him, and so, in addition to keeping the engine in faultless condition the rider who wants to cut down his running costs by reducing the item of depreciation, or in other words getting more for his machine when he sells it, will pay attention to appearance, plating and enamel.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Motor Cycle Record Long Jump.

Sir,—Being a regular reader of your valuable paper, I read with interest in several recent issues the accounts of motor cycles leaving the ground. It may interest you to know that H. Jenkins, the winner of the Australian Tourist Trophy race, on approaching a slightly elevated railway crossing in the Victoria M.C.C. 100 miles road race, held at Camperdown, Victoria, cleared (on a 7 h.p. Indian) a distance of thirty-two feet; this feat was witnessed, and the distance measured immediately, by the officials.

It seems strange to me that none of the English companies follow the example of the Hendee Manufacturing Co. by establishing a home controlled depot, as the Indian seems to be becoming the most popular mount on our roads.

Murrumbeena, Victoria, Australia. GUMSUCKER.

Retreading Tyres

Sir,—After reading an article on retreads in *The Motor Cycle*, written by "Vet.," I should like to voice my opinion. Last year I was in England for a holiday, and purchased a new 6 h.p. combination, which had on the back wheel a 650 × 65 heavy tyre of a well-known make. I rode the machine for 2,000 miles, and by that time the canvas was showing, and, as I was leaving for South Africa and bringing the machine with me, I naturally wanted a new tyre, but an agent persuaded me to have the old one retreaded and recommended me to try the Hermetic. I took his advice, and have not regretted it. It was a 16 oz. tread, and cost (I think) 13s. It ran "by speedometer" 3,215 miles before being scrapped.

Now, seeing the original tyre only did 2,000 miles on good English roads, I think it speaks excellently for the Hermetic to do the above mileage on our rough South African roads, and the difference in cost between a retread at about 13s. and a new tyre at, say, £3 is an item worth considering by any rider. W.J.

Krugersdorp, South Africa.

Rear Lights.

Sir,—Recent correspondence in your columns on the subject of rear lights has prompted me, as a motor cyclist of twelve years' standing, to express my opinions for what they may be worth.

First and foremost, no one has any right to travel at night, by road, at such a speed that he is unable to stop dead within his range of clear vision ahead, unassisted by lights carried on anything he is overtaking. This, to me, is self-evident, and anyone disregarding it is guilty of criminal negligence, since he is endangering not only his own life, but those of other road-users. Consequently, I have no sympathy with those who advocate universal rear lighting, since such an enactment would be a direct inducement to careless driving.

I admit the absurdity of the present law, which renders rear lighting obligatory on motor traffic only, but, paradoxical though it seems, I consider that the number of accidents would be lessened if tail lamps were totally abolished, and riders compelled to depend entirely on themselves R. T. GOULD (Lieut. R.N.)

A Colonial Rider's Ideas about Singles v. Twins.

Sir,—In your issue of April 30th, page 571, "C 1354's" comments on his experiences with a big twin seem to me to be a bit one-sided, or else he is prejudiced against a twin machine. He says that a single is far steadier to ride through grease (which I fail to see, having ridden both), and anyone with any knowledge of what he is talking about knows that it must stand to reason that the even pull of a twin machine when riding through grease is less prone to sideskid than a thumping, jerking single, especially up a fairly steep greasy hill. Why, I have had my single turn right round on the road with me, with machine down on bottom gear of 14 to 1 or so, and the same hills would not cause me the least trouble on my twin Matchless, which is only a single-geared machine.

In concluding, just let me say that the twin machine is far ahead of the single machine for even pull, perfect balance, and comfort when riding in all weathers.

New South Wales, Australia. LOUIS H. LEE.

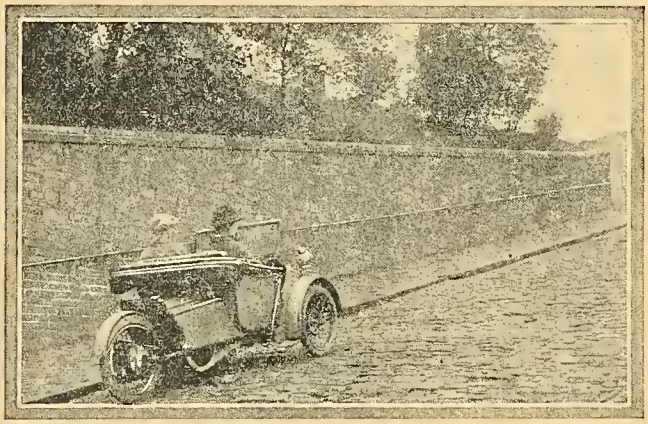
Useful Work.

Sir,—I cannot help but write to you to let you and your readers know the service the A.A. and M.U. have done for me. I was travelling with motor cycle and sidecar on a Sunday night in a little place called Pudsey, when my lamp flickered ominously and then gave up the ghost. It would not keep in, and naturally I was pulled up by an inspector and two policemen. I received the summons exactly thirty-six hours before due to appear, so I immediately sent it to the A.A., with the notification that I

At the starting line at the Penrith speed trials on Bank Holiday. In the foreground may be seen A. J. Brewin (Zenith) and R. Bownass (N.U.T).

could not attend. I heard nothing at all about the case until two days after the trial, when the A.A. sent me a letter—delightfully brief—saying they were successful in getting the case dismissed on payment of costs 4s. 6d. I can only surmise the trouble they were put to, for as they only received my letter less than twenty-four hours before court time, they must have had to wire their Yorkshire representative full particulars; there was no time for a letter.

I. FREEMAN.



An A.C. Sociable climbing a 1 in 3 gradient. (See P. W. Hill's letter.)

Hill-climbing on a Three-wheeler.

Sir,—I enclose a photograph of my A.C. Sociable on a 1 in 3 gradient at Walsall. This hill, which cannot be rushed, or the steepness realised from the picture, was easily climbed, and the engine gave no sign of over-heating or knocking. On reaching the top, we immediately proceeded "all out" without any ill-effects.

The cycle car is a standard 1913 model, except that I have fitted Harcourt radiators. I can now average about 4 m.p.h. faster, and the oil consumption is approximately 2,000 m.p.g., but the fuel consumption is so hard to believe that I had better not state it. Another improvement is that very little deposit now forms under the piston head and the oil keeps much cooler. The condition of the original Liversidge rear tyre may be noted; it is still unpunctured after covering 5,000 miles.

PERCY W. HILL.

The Question of Weight and Overseas Requirements.

Sir,—I notice several of your contributors manifest concern over the weight of the modern motor cycle, and urge the importance of manufacturers giving this point some attention, with a view to the evolution of a motor cycle which will really be a "lightweight."

Personally I own a 2¾ A.J.S., and it is looked on by the makers, at least, as a "lightweight"; but judging by your contributors' views I doubt if it would come within that classification. However, as an engineer, I must say I sympathise with the manufacturers, because I think nowadays machines are designed on quite sound principles. A few extra pounds weight are nothing compared to the greater assurance of safety, and it cannot be wondered that manufacturers are at present wary in cutting down weight, because if any firm were to produce machines which were extra light, the greater the chance there would be of them "buckling up," or breaking somewhere, under the stress and strain of even moderately hard usage. A machine travelling at twenty miles per hour passing over a stone of moderate size is very badly jarred, and the stress in certain of its parts must be very great indeed.

I must say, though my A.J.S. is "heavy," it is certainly as "handy" as can be and beautifully balanced, and this may be said, I am sure, of many other makes. I have never ridden a high-powered Indian, but a friend of mine assures me that the extra heavy weight is quite recompensed by the ease of its control.

As regards "overseas requirements," weight and safety are certainly great desiderata, combined, of course, with ease of control, and while considering the latter subject I think the handle-bar clutch is essential, and I notice "Ixion" and others in your paper strongly advocate this item of design. In choosing my machine this year I ruled out all machines having absurd and unsightly little bits of iron sticking out near the footboards, which, on reference to specifications, I found were termed "clutch controls!"

Sagar, Punjab, India. W. G. QUINTON, A.M.I.C.E.

Suggested Double Purpose Machine.

Sir,—I have noted the letters on the above subject, and I have, I think, found the ideal dual purpose machine in the 6 h.p. model twin-cylinder Bat (770 c.c.), fitted with three-speed counter-shaft gear box, and chain-cum-belt over large pulley. Of course, it is heavy for solo work, but the weight is placed low in the frame and is not noticeable, and the machine steers well.

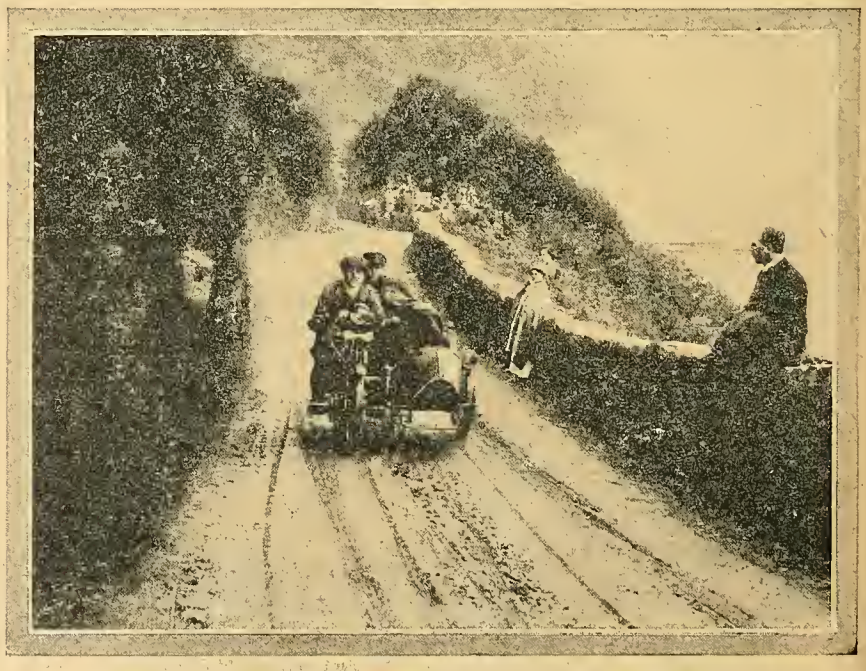
It is not necessary for me to enlarge on the speed capabilities of this machine, which is fitted with the famous J.A.P. engine, but I should add that the charm of driving such a type of motor cycle has been fully dealt with by one of the contributors to my favourite paper, *The Motor Cycle*. I am in no way interested in the Bat Motor Manufacturing Co., and should like to suggest to them the following alterations which I should consider improvements, viz., a long exhaust pipe to the rear, optional fitting of domed glass type of drip feed, and a more "sporty" type of handle-bar than any they fit at present.

BATITE.

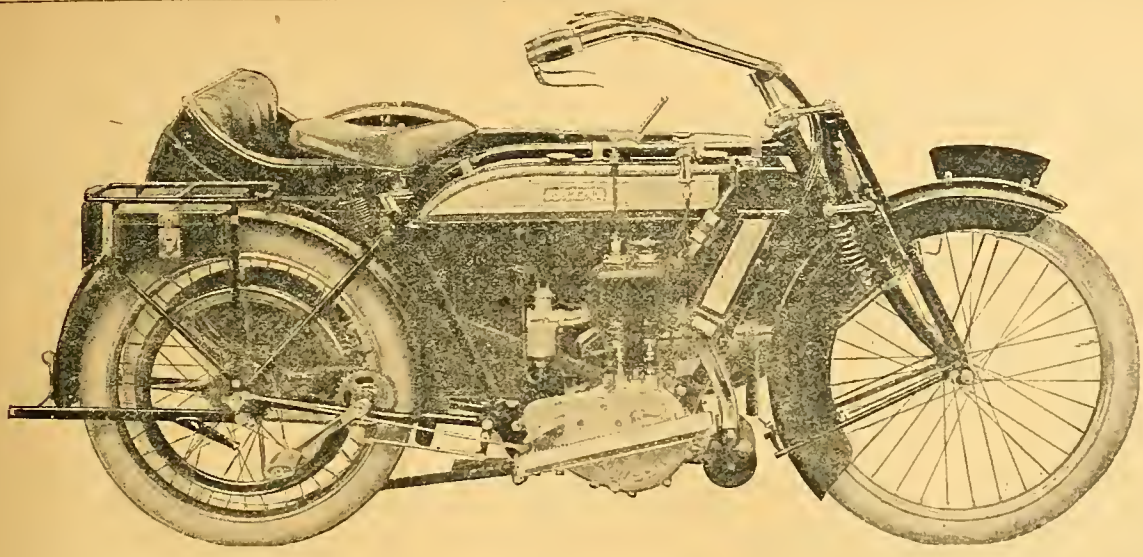
Age and Weight.

Sir,—I think many of your readers will be interested to hear that a man seventy-three years of age has recently purchased a 2½ h.p. Sun-Villiers and can be seen almost daily riding in Wisbech and the neighbourhood. Another rider of a similar machine weighs no less than seventeen stone, but has no trouble in climbing hills, which, I think, speaks well for so small an engine.

B. B. AMES.



A. Fielder (New Hudson) on Countisbury Hill, in the M.C.C. Bank Holiday Tour



THERE are too many tests—too many Gold Medals—to give much guidance to a purchaser nowadays. The above cycle goes on winning them, but—

HERE are a few Purchasers' Facts in place of Test Results.—(1.) The Humber is the lowest-priced 3½ h.p. 3-speed Motor Cycle of high grade on the market. (2.) It is built of better material than any other—simply because the makers buy in bigger bulk, have better facilities, and test all material in a fully equipped Laboratory. (3.) It carries every modern improvement, as the Specification below will show. (4.) With its Water-cooled Engine it can take a sidecar and passenger up any 1 in 5 grade, easily. (5.) It is simplicity itself to handle, and never seems to need repair. We hope to publish a few figures on this subject. (6.) It is single-cylinder—and economical.

SPECIFICATION: 3½ h.p. Single-cylinder Engine (water-cooled), 84x90 mm. Bore and Stroke, Half Compression Device for easy starting, with Kick Starter, Sturmey-Archer 3-speed Gear, Brown & Barlow Carburetter, Bowden Wires, High Tension Magneto (Gear-driven), Extra Heavy Dunlop Rubber-Studded Tyres, Lycett Pan Seat or Brooks B170 Saddle.

SIMMS 'MEC-HORN'

A Self-contained Warning Signal.

THIS is quite small and you can clip it to the handle-bar of your machine in about a couple of minutes. If you prefer, it can be attached to the footboard—a favourite position—so that the trigger is handy for the foot. But wherever you fix it, Simms "Mec-Horn" will do its work well. The lightest touch on the trigger will produce a *loud*, clear blast which can be heard far in advance ; one which makes everybody aware of your approach. Ask your dealer to show you this well-made warning signal which is self-contained, and so is independent of battery or hand bulb.

The Price of Petrol.

Sir,—It seems to us not only unpatriotic, but also "killing the goose which lays the golden eggs," for retailers in the motor trade to charge exorbitant prices for petrol.

We admire the petrol companies who are spending a lot of money at the present time in advertising "no advance in the price of petrol," and the action of retailers who are using the present crisis as means of getting inflated profits cannot be too strongly condemned.

We would like it to be known that, so far as we are concerned, our rate of profit will remain the same as before the crisis, so that if we can get supplies from the petrol companies, people in Birmingham can rely upon supplies at normal prices.

We trust that our action will be the means of breaking down the artificial inflation of prices which has taken place.

THE COLMORE DEPOT.

Defective Head Lights.

Sir,—I am desirous of giving you the following facts, which are of interest to all road users.

I was driving a motor cycle and sidecar near Manchester a few nights ago when the sidecar occupant and I, at the same instant, saw ahead, faintly, about three yards away, a red light. I was driving with exceptional care at the time, there being many cyclists about, and I was going at only fifteen miles per hour because I was mounting a steep gradient over a railway. I just managed to swerve to the right in time to avoid running down a cyclist and thus prevent a very nasty accident.

If the reflex light had not been there, or if I had not been very careful and quick, the result would have been most serious, and I still feel that it would not have been negligence on my part any more than on the cyclist's part if I had been unfortunate enough to run him down.

The head light of the cyclist could not be seen unless one was in front of the bicycle.

ARTHUR G. ELLERSHAW.

Canadian Road Conditions.

Sir,—I have been much interested in the correspondence in your columns with reference to riding conditions in Canada. I have been riding some time in this country, and the following mileage figures will show you that in Sunny Alberta we do not store away our machines for the winter: November, 1913, 852; December, 1913, 403; January, 1914, 168; February, 1914, 6; March, 1914, 448; April, 1914, 711.

I think it is true of all Western Canada that a Colonial model need not have a minimum of plated parts. My Triumph is a 1911 model. I have run it myself 8,000 miles and the enamel has been touched up several times, but the plating is as good as when it was new. This is due to our dry climate. The two photographs enclosed show what we consider a fairly good road and a bad one. Some of the people at home do not know what bad roads are when they grumble about roads in trials. The machines in the photographs are Indian, Flying Merkel, and Triumph, and the road shown is a main road about twenty miles south of Medicine Hat. The ideal overseas machine will not be developed until some of the British manufacturers visit the countries they wish to cater for, and ride round a bit. In this way they would soon find the shortcomings of the standard machine. I believe that a man who has ridden a considerable distance in this country could take a single-geared mount over any road that the A.C.U. could find in Great Britain. I wish I could have a go at some of your trials with mine.

W. ST. GEORGE.

Alberta, Canada.

Another Freak Hill.

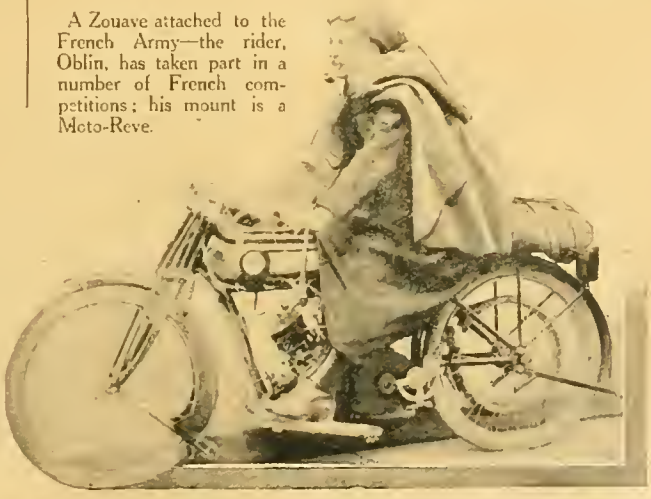
Sir,—I believe you are interested in freak hills, and there has been one discovered lately which well bears the name. It is near Todmorden, on the borders of Lancashire and Yorkshire. You take the road to Bacup from Todmorden, go under the railway arches about a hundred yards up Bacup Road, and the hill is on the left-hand side. It is known as Naze Road, and can easily be distinguished by the white farmhouse at the top. There are two gates to open—one at the bottom and the other near the top.

The hill is over half a mile long. Regarding hairpin bends, surface, and gradient, I can describe it best in the words of a motor cyclist who when he saw it said: "I have climbed most of the freak hills, including Park Rash, but have never seen anything to beat this."

Two members of the Rochdale M.C.C., both on three-speed Ariels, succeeded in reaching the summit, though both footslogged, but anyone who sees the hill will not wonder why, as it is next to impossible to get round the bends with both feet on footrests.

It has not yet been climbed with sidecar, and whoever does it will make a meritorious performance, for a worse hill I do not think it is possible to find.

G. W. STANSFIELD.



A Zouave attached to the French Army—the rider, Oblin, has taken part in a number of French competitions; his mount is a Moto-Reve.

No branch of the Service has responded to the War Office appeal for volunteers in more spirited fashion than motor cyclists. Their patriotism is proved by the fact that on Friday last, 2,000 in excess of the number required had been enrolled in London alone.

Value of Motor Cycles Recognised.

IN view of the eagerness with which the War Office has seized upon motor cycles for despatch work, we of *The Motor Cycle* cannot but feel gratified, as we have so long and so imperatively urged the greater use of these machines for such purposes. However, now the military authorities have acted, they have done so in a most thorough manner, and a vast number of up-to-date machines, well ridden, are at the disposal of the country.

Private Owners to the Fore.

The response of private owners to the War Office appeal has been wonderful. The sporting as well as the patriotic feelings of motor cyclists generally have been aroused, and hundreds of riders have placed themselves and their machines at the disposal of the authorities. In fact, so great has been the response in the Midlands, that thirty machines sent out from one famous firm, in the hands of expert riders, have been regretfully declined, for the present at any rate.

Other Ways of Helping.

It must be remembered that there are other ways than despatch riding in which drivers may give their services. The War Office requires first rate drivers of motor lorries and motor-propelled ammunition and forage waggons; also expert engine men for the flying section. It is, of course, essential that such candidates be first-class mechanics, and thoroughly understand car type engines, but many motor cyclists and cycle car drivers are in this position. Generous terms are offered for such services, particulars of which may be had from the nearest recruiting office. The aeroplane section of the army also requires skilled fitters, and many motor cyclists, anxious to volunteer, might be eligible in this direction, if their services cannot be used in other ways.

What must be Carried.

Most modern machines are suitable for use with the forces, but the War Office has in the past shown a preference for the 500 c.c. single-cylinder and the horizontally opposed twin-cylinder. The following list of spares must be carried when on active service:

One valve complete with spring, washer, and cotter.
One sparking plug
One piston ring.
Tyre repair outfit, including spares for valve.
Spare tube.
Spare belt and fastener, if belt-driven.
Spare links and spare chain, if chain-driven.
Complete set of spares for magneto.
Selection of nuts and washers.
Two valve cap washers (if used on machine).
Complete set of tools.
Two gaiters for tyre repairs.

A spare cover will be carried by signal units for each machine.

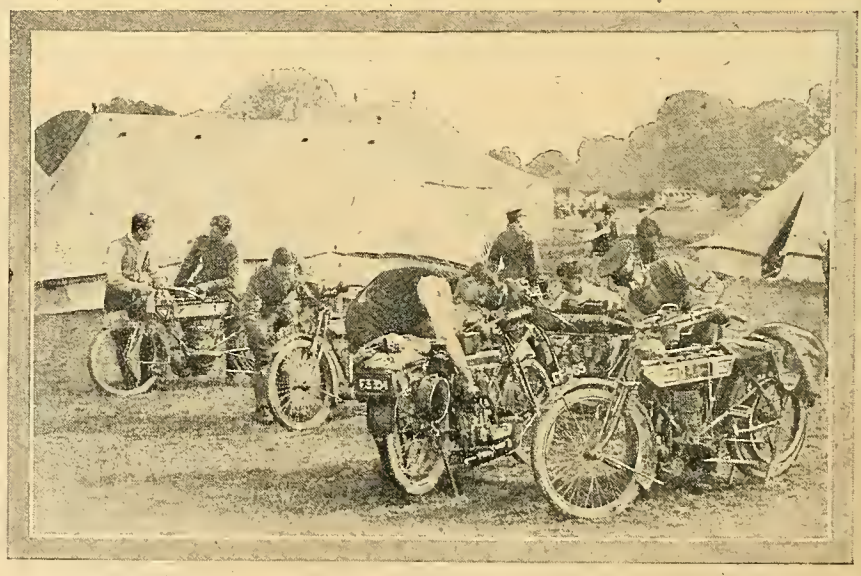
Great Rush of Applicants.

So great has been the response to the War Office appeal that we learned, on enquiry at Fulham House, Putney Bridge, S.W., where Capt. Stafford and Capt. Trapmann are in charge, that, on Thursday afternoon last, the applications exceeded vacancies by about four hundred. On Friday there were 2,000 names in excess of the number immediately required. Capt. Trapmann has enrolled twenty-five riders able to speak foreign languages, who will accompany the expeditionary force in the dual capacity of despatch rider and interpreter.

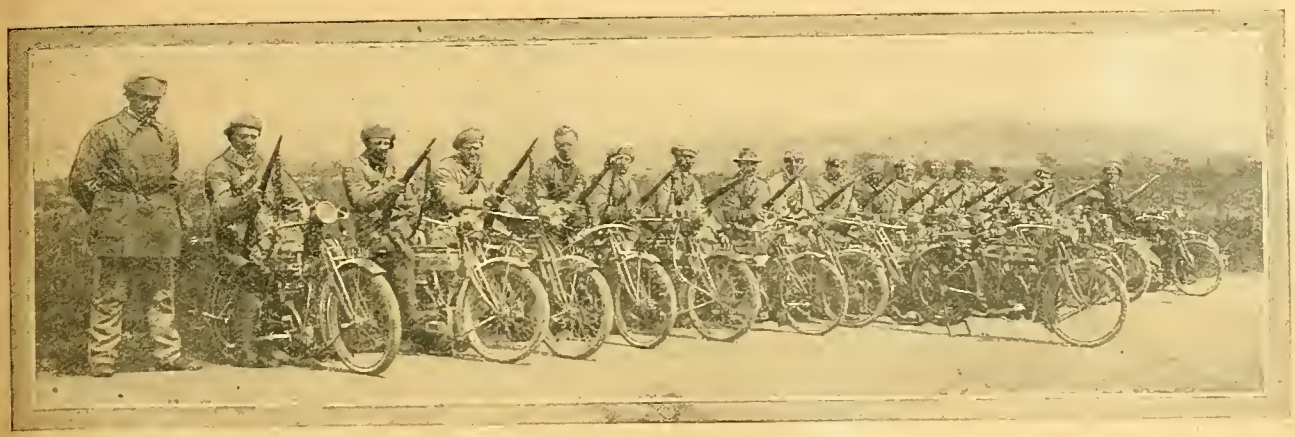
London Recruiting Scenes.

Here, by Fulham House, under the railway bridge, about thirty machines were ranged up on both sides of the road, while a little farther on, seated at a table and assisted by a rather juvenile orderly, was Lieutenant B. C. Pollard, who is a keen motor cyclist, a capable journalist, and a man of experience under actual war conditions. He was handling a difficult task in an extremely business-like manner, and any attempt to get round him on the part of an applicant was a complete failure. Not very long after our arrival a man of short stature brought round a four-year-old machine, the value of which was stated on his application form to be £35. The officer in charge asked him if he thought that that was the real value of the machine, to which the applicant replied in the affirmative, with the result that the officer asked him how he had the audacity to value a machine of an undetermined vintage at such a high figure, tore his paper in half, and sent him about his business.

Crowds of disappointed motor cyclists surrounded the table, and the most extraordinary scenes were witnessed. Those who had been lucky enough to be taken on were spending money in all directions in getting their machines put in first-class order, or even buying new ones if they thought that their own were not good enough; in fact, the number of new machines specially bought for the purpose was astounding. As the case was one of national emergency, preference was given to men who paraded in person with their mounts, bringing them up to be examined, and making their applications on the proper forms, rather than by taking in strict rotation applications which were received by letter.



IN LANCASHIRE. Motor cyclist section of the East Lancashire Divisional Signal Service. Members overhauling their machines after a hard day.



IN IRELAND. Armed Irish motor cyclists ready to defend their country. It will be noticed that the Irish volunteers carry rifles.

An Article to be Digested.

It is now just as well to call our readers' attention to the fact that in *The Motor Cycle* of July 17th, 1913, page 930b, we dealt very fully with the question of the new scheme drawn up by the War Office affecting military motor cyclists. In it, it may be remembered, reference was made to the fact that there were two schemes applicable to those who were willing to serve the country as motor cycle riders—(1) Territorial motor cyclists primarily for service at home, and (2) as members of the Royal Engineers Special Reserve, who might be called upon to go abroad. Now, if motor cyclists who are interested in military matters and are of a patriotic nature had read this article and had kept it by them they would have learnt exactly what to do at the time of the nation's need, and would have saved the organisers at the present time a vast amount of trouble, to say nothing of rendering their country valuable service. Under the present state of affairs there has been ample evidence of patriotism and a splendid show of keenness, but the patriotism has not been of the right sort, and is resulting in the presentation of untrained men to carry out important work. Looking back to the article referred to, it drives home the fact that the men the country wants are those who are thoroughly well trained and are able to read maps accurately.

Work Falls on Wrong Shoulders.

Lieut. Pollard was complaining that the London Motor Cyclists Reserve Committee should have been carrying out the work that he was doing, while Captain Stafford and he should have been free to drill recruits. He told us also that the applications after they had been dealt with by him were sent to the officer in charge of the Record Department of the Royal Engineers at Chatham. Although the lists were absolutely closed many riders had gone down to Chatham direct to try and get themselves placed on the roll, but without avail.

It is interesting to note that no fixed geared machines were accepted, and very few under 500 c.c., only those being received which were fitted with horizontal twin engines. Only one or two other 2¾ h.p. were taken in. In London motor car traffic has been considerably reduced, but a large number of motor cycles is to be seen in the streets; a detachment of ten were seen in Pall Mall the other afternoon, while outside the War Office a sixteen-stone rider was seen leaning on a motor cycle and side-car. As we have mentioned before, every post has been filled up, and, as far as we can make out, there is not a single vacancy even among the county associations. All we can do now is to register and classify names, and forward these to the Secretary of the Auto Cycle Union, who will further classify them and forward them to the right quarter. So many applications have been received by *The Motor Cycle* that they cannot be replied to individually, but every applicant may rest assured that his name and address will be duly registered by the authorities, and if he is wanted eventually he will receive due notice.

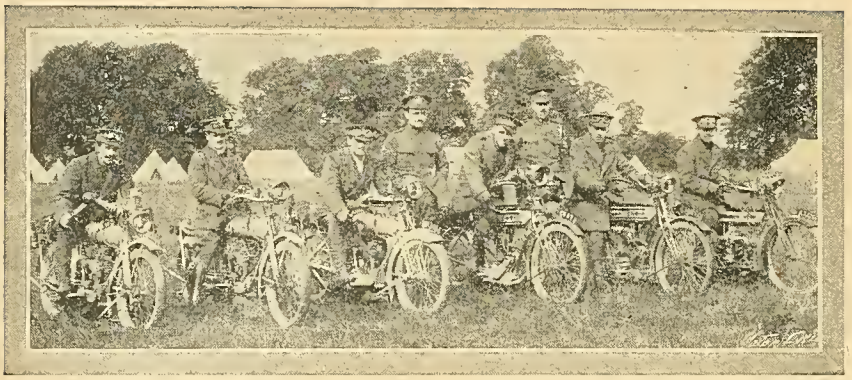
The Terms of Service.

Although at the time of writing there are no vacancies remaining for motor cycle despatch riders, it is inevitable that more will be required from time to time, and would-be applicants should communicate with their various county associations. In the meantime we will repeat the terms of service. On rider and machine being approved, a gratuity of £10 is immediately paid, and a further £5 will be paid on discharge for any reason other than misconduct. The pay is 35s. per week, and 15s. will be paid for overalls if in serviceable condition. The machine will be taken over at valuation by the military authorities, or will be replaced by a new one at the close of operations. Enlistment is for one year or for as long as the war may last.

Special Constable Service.

There is also a force of special constables, thirty thousand in number, to be enrolled in London, and it is proposed that a body of fifty motor cyclists should be included among these. They are

LONDON RECRUITS A group of London and district motor cyclist volunteers lined up outside the recruiting depot at Putney Bridge.



ON THE EAST COAST.

A group of the motor cycle section attached to the E.A. Royal Engineers, Bedford, who are at present stationed on the East Coast. The machines are composed of three twin Bats, two Rudges, and a Douglas.

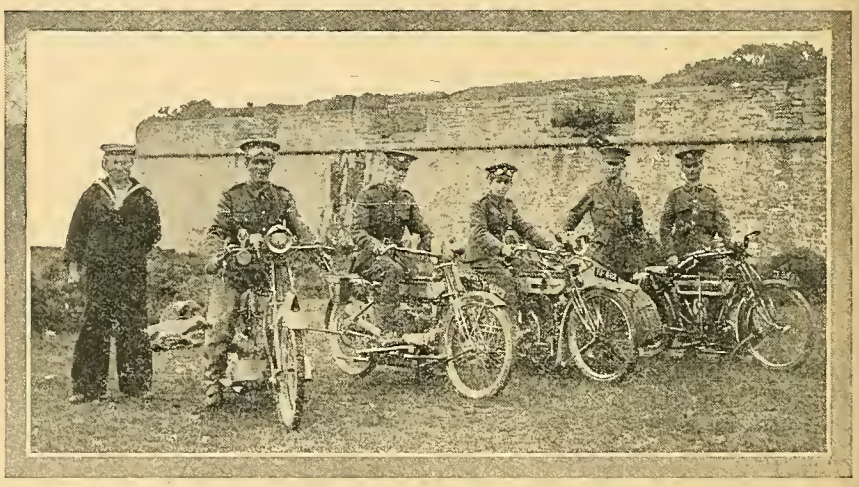
destined to work inside the Metropolitan area and five will be allotted to each district. Their duties will be to carry out patrol work. It is not proposed to pay them any remuneration, but 2d. per mile will be paid for the upkeep of the machine and its repairs while on service. Those who wish to join this force should send in their names to *The Motor Cycle* stating the make and horse-power of the machine and giving full address. Applications may also be made in person to the officer in charge of the *personnel* of the Special Police Force, Scotland House, Scotland Yard, S.W.

Despatch Riders with the French Army.

From what we have seen of the French Army in its early stages of mobilisation, it does not seem to be too well provided with motor cycle despatch riders, though it is known to possess a squad of Triumph riders. One of the most notable riders whom we saw was Oblin, who took part in the Paris-Nice trial in 1913. He was mounted on a very smart looking 3½ h.p. Moto-Rêve. He is a very fine looking man, and was in the full uniform of a Zouave, and very picturesque he looked. After having his photograph taken (see page 219) he left under orders, and made a good thirty miles an hour average over the rough road between Evreux and Nonancourt. At Havre we came across another French despatch rider, who was mounted on a Clément-Gladiator—a machine strongly resembling the English Royal Enfield in its general details.

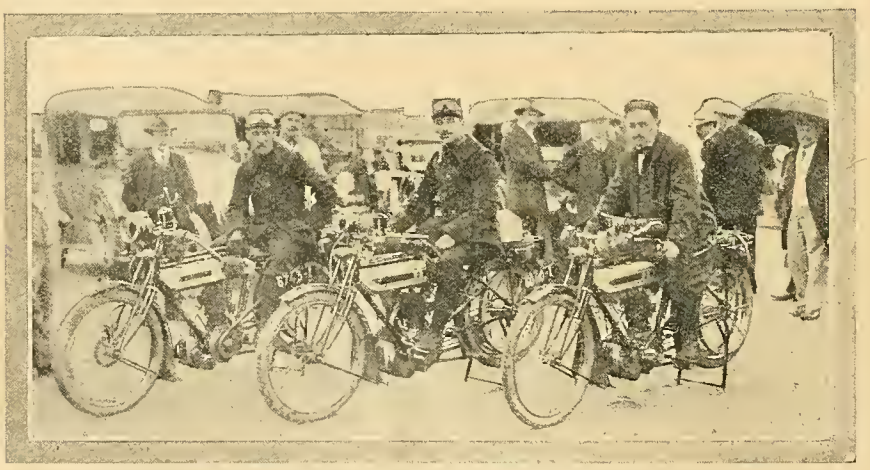
Machines for Naval Depots.

It is not only for the Army that motor cycles are being employed, for we learn that the Admiralty have taken over fifty machines from the Triumph Cycle Company, Ltd., and have intimated that more may be required. These machines, which have been despatched to Chatham, are each equipped with a spare cover and tube and the usual assortment of spares required by Government, to which the Triumph Co. have added more as suggested by experience. It is also interesting to note that no machine is accepted by Government which is not equipped with some form of change speed gear, and many riders are finding the Philipson pulley converts their fixed gear machine to comply with Government requirements. Other firms report heavy demand for their goods,



SCOUTING THE SOUTH-WEST COASTLINE.

Officers of the Seventh Devon Battalion at Berry Head, Torquay, where they are patrolling the coast, close to the place where the Spanish Armada was first engaged. Machines: Lea-Francis, Enfield, Triumph, and Levis



IN FRANCE. Motor cyclists are attached to the French Army. The trio seen above at the general mobilisation are mounted on British built Triumphs

and the Service Co., Ltd., of High Holborn, state that there has been a great rush on their stock of motor clothing. Messrs. Rudge-Whitworth, Ltd., have also received a considerable order from the Military Authorities for motor cycles. As an indication of the enormous part the internal combustion engine plays in modern warfare, we may mention that the value of the order placed last week with the Daimler Co., Ltd., was no less than £130,000.

Motor cyclists are attached to every one of the countries at present engaged in warfare.

Coventry Manufacturers and the War.

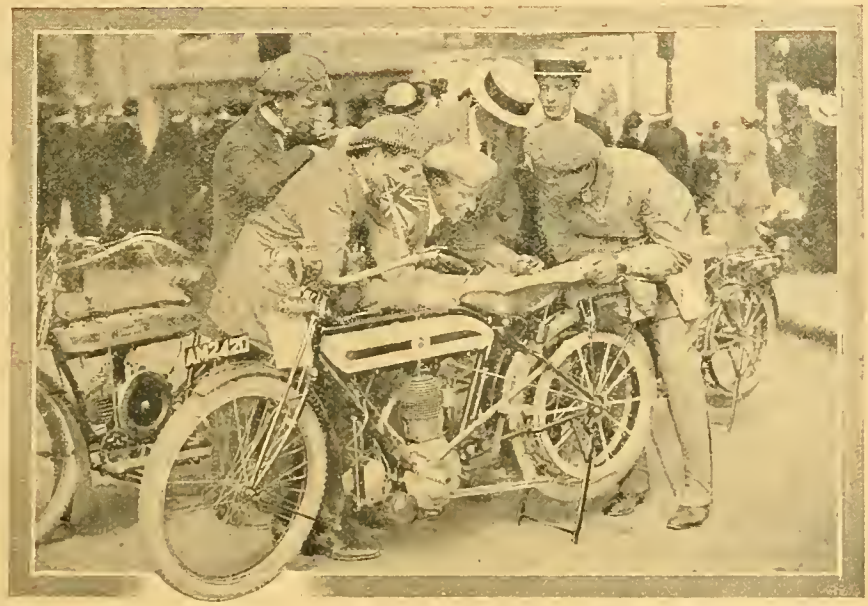
Recent events have naturally had their effect on the motor cycle trade. Foreign orders have, in many cases, been cancelled, but the bulk of the British trade remains as before, and the general opinion seems to be that from a trade point of view matters will become much more normal within a fortnight. The wild rumours which are always circulated under such conditions do much to damage

Military Motor Cycling Notes.

the industry until people become more accustomed to them and their inevitable denials. On the other hand, some Coventry firms have Government orders to execute, and not a few can stand a stock of machines for the future. At a meeting of manufacturers last week it was decided that work should go on as nearly as possible as usual, and the works opened this week though mostly on short time. This is a wise precaution, as it will help to spread the employment of labour over a longer period. Arrangements were made for assisting the families of those who have been called out to serve their country.

Advice to Non-selected Riders.

Now that there are practically no further vacancies for motor cyclists in the Army at the present time, the next question which presents itself is as to what steps the numerous disappointed riders will have to take if they desire their wishes to serve their country to be gratified. If the war continues, a certain proportion have decided hopes of employment, and we would point out that it is quite unnecessary for them to waste their time during their leisure hours. Naturally, all competition work is at a standstill, and we therefore suggest that local club members and individual motor cyclists should set about studying map reading and army conditions, so that if they are wanted they will be of real service to their country. We venture to state that a large percentage of the motor cyclists who have been accepted are at the present time bound to be inefficient as soldiers, however good motor cyclists they may be. A military rider must fulfil both qualifications, as a good motor cyclist who is not a soldier is of less use to his country than a good soldier who is a poor motor cyclist. Throughout the country there are many retired officers and non-commissioned officers who could be of inestimable service in showing those on the "waiting list" the rudiments of drill and map reading, and tell them the duties of despatch riders. One of the chief points in which the motor cyclist raw recruit may fail would be his inability to recognise the badges of rank of the officer to whom he has been instructed to carry a message, and he will waste much time in asking this and that soldier as to where the said officer may be found. It is therefore necessary that he should be instructed as regards the uniforms of commanding officers and the duties their respective ranks carry with them. We would therefore urge that all who have been disappointed make a serious attempt to obtain this knowledge, and to bear in mind that preference will be given to those who have had training as against those who have not. The Auto Cycle Union, whose secretary holds the rank of captain, might do excellent work in this respect.



Filling up a form at the London recruiting station last Thursday. The rush to enlist has been most noticeable among motor cyclists.

The windmill on Wimbledon Common, the rendezvous of motor cyclist volunteers in response to the War Office appeal. Though more than sufficient despatch riders had already been enrolled, most of those who volunteered on Saturday were accepted by Scotland Yard to distribute Royal proclamations.

The Rush to Enlist.

It is not only in the Metropolis that the rush to enlist has been so phenomenal. It is the same all over the country. In Birmingham the excess of applicants over the number required was tremendous. In Liverpool, where the

Military Motor Cycling Notes.—

A.C.U. have a Local Centre, the same tale is told, and in the first two days of recruiting over a thousand riders presented themselves.

Official Action Only Wanted.

Quite a number of correspondents have written us requesting that *The Motor Cycle* should organise a civilian motor cyclist corps. While we naturally feel the greatest sympathy with all and every effort to help the Government, we do not feel that the present time is the one for private enterprise of that sort. The authorities are fully competent to deal with the situation, and everyone who wants to join has only to fill up the necessary papers, hand them to the A.C.U., 89, Pall Mall, S.W., or to the nearest recruiting depot, and, if required, the applicant will be called up in due course.

A Good Example.

At Bristol a committee sits to allocate applicants to any special class of work. For instance, if a man volunteers for active service with the regular army his name is sent to the War Office authorities. If he volunteers for home service with the Territorials his name goes to the proper quarter, but it is in connection with men offering themselves and their machines for special work, such as service for hospitals, postal deliveries, etc., that the committee's work bears the greatest result. The committee works on the principle of a Labour Exchange, and on request from any public department for help will find the man and machine for the job. A fund is being started to provide grants towards those riders whose work may not come under direct Government remuneration.

An Error Dispelled.

One curious and common error may here be dispelled. Many persons imagine that the Government will not accept V type twin-cylinder engines, or, in fact, any engine over 500 c.c. They will, and do, accept them. What they will not do is to buy them, as the Army regulations lay it down that only single-cylinders and horizontally-opposed twin-cylinders are eligible for purchase by the War Office, but this may be changed at some future date.

RALLY OF MOTOR CYCLIST VOLUNTEERS

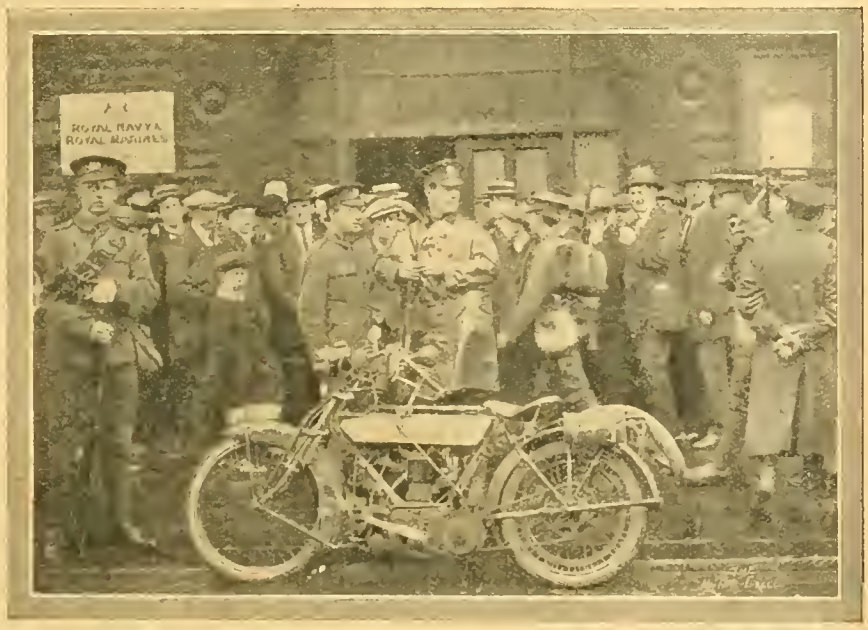
A rally of motor cyclists was held on Wimbledon Common last Saturday afternoon, with the object of obtaining offers of assistance from motor cyclists during the war. Our illustration shows the assembly, which comprised owners of all sorts of motor vehicles: motor bicycles, sidecars, cycle cars, and cars.

AN instance of the patriotic response of motor cyclists to the War Office appeal was afforded by the gathering of riders on Wimbledon Common last Saturday. The rally had been well boomed in the daily press, and a gathering (numbering nearly 500) of owners of motor bicycles, sidecars, cycle cars, and cars collected on the Common. All vacancies for despatch riders had been filled up for some days, however, and the numerous participants foregathered with the knowledge that 2,000 motor cyclists in excess of the number required had offered their services. This applied to London alone, and the same brisk response by motor cyclists had been made at the provincial recruiting stations. General Sir A. Turner addressed the Wimbledon gathering. Places were to be found for those despatch riders who knew Flemish, French, or German. It was announced that the Scotland Yard authorities were prepared to accept the services of motor cyclists up to 500 in number to distribute Royal proclamations all over London and district.

The Value of Short Range Rifle Practice.

A Suggestion to Motor Cycle Clubs by "Road Rider."

NOBODY can prophesy with confidence what course events are likely to take, and, though we hope for and expect the best, it is still perfectly possible that every healthy adult may be requisitioned for actual warfare. It would be a great pity if the bulk of our 150,000 motor cyclists were only available as despatch riders, and proved inefficient combatants in emergency. A memory of the Boer war suggests that clubs might usefully take steps to train their men in marksmanship. Rifle practice is interesting and instructive, and with competitions mostly cancelled it would be taken up enthusiastically. During the Boer war an enthusiastic patriot persuaded forty or fifty young men to practise with air-guns at a range of twenty-five yards in his garden. None of them had ever handled a service rifle until they went down to the butts to pass a shooting test on enrolment. But the effect of a few hours' short range practice was such that every single man secured a percentage of hits at 200 and 500 yards sufficient to qualify him for the marksman's badge in the regular army under the conditions then existing for the award. Short range practice with an air-gun or miniature rifle does not, of course, train a man in allowances for windage and refraction; but it is a splendid exercise in the rudiments of aiming and trigger pulling. If the war should be so long drawn out or severely contested that calls are made on the full manhood of the nation, large corps of motor cyclist marksmen, possessed of extreme mobility, might prove to be of unique service; and I commend the suggestion to our large clubs, whose membership already provides more than a plethora of despatch riders and motor cyclist scouts.



NORTH-COUNTRY VOLUNTEERS. A Territorial motor cyclist (a rider of a Bradbury) arriving at the Headquarters of the Sixth Manchester Regiment for the purpose of handing in his name. Observe the queue of volunteers in the background.

SCOUTS ON THE EAST COAST.

Our correspondent on the central east coast reports that a large number of motor cyclists are engaged there as scouts, despatch riders, and in similar capacities. Petrol is very difficult to obtain, as naturally the Government commandeer most of the available supplies, and consequently prices are very inflated. Everyone is reported as being very keen on his work, hard beds and bully beef being the only flies in the ointment. Hay beds are spoken of most highly as providing the acme of luxury. The scouts are armed with revolvers, and possess the power of commandeering a new machine if their own breaks down, a procedure which has occurred on more than one occasion.

Some of the motor cyclists who attended the Wimbledon meeting, at work. Scotland Yard have pressed a number of motor cyclists into service, whose duty it is to patrol country districts and distribute Royal Proclamations. The machines carry a distinctive plate on the front with the lettering, O.H.M.S.

THE HOME OF THE F.N.

The Belgian and Russian Armies use F.N. motor cycles exclusively. Incidentally it may be mentioned that the forts at Liège (where the F.N. factory is situated) are equipped with guns manufactured in the F.N. works.

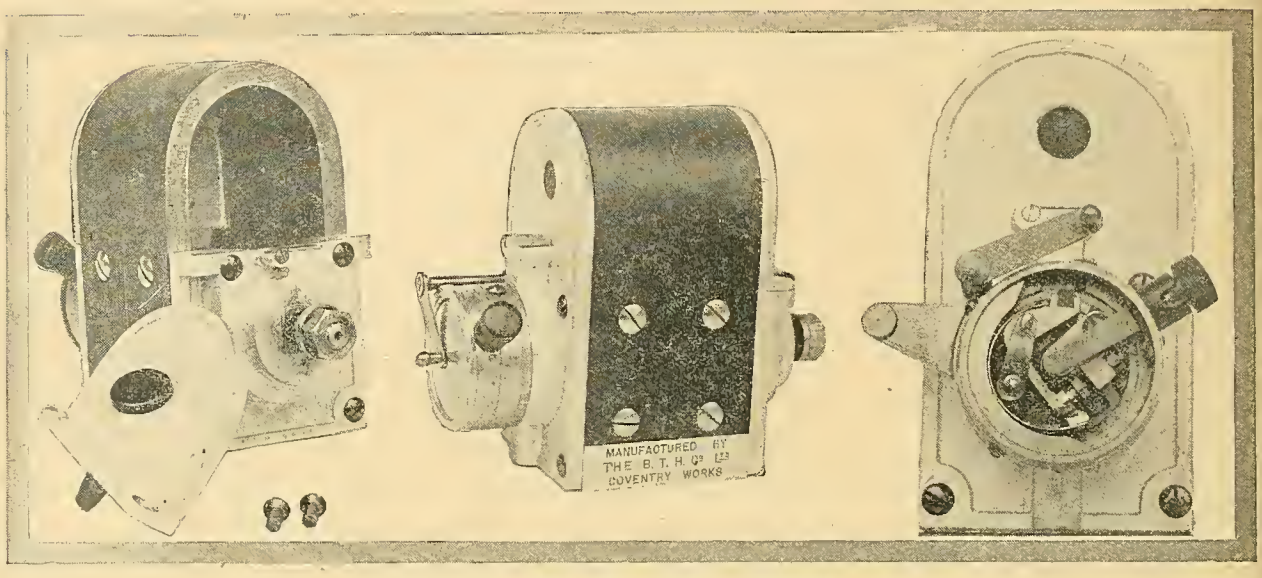
Olympia is at present being used for the incarceration of German aliens.

ADVENTURES IN FRANCE.

Maurice Greenwood, Todmorden, who was one of the English party which went to Grenoble for the abandoned F.I.C.M. Six Days Trials, has got back safely and sent us his experiences. Their machines were commandeered by the French military authorities at Lyons, and eventually, through the good offices of the British Consul, the party escaped from Lyons to Paris in a troop train, which averaged 10 m.p.h. to Paris. Thence it was an easier matter to reach the shores of England. W. Chater-Lea and his wife and C. Pressland, the two cycle car drivers, are still unaccounted for, and they must still be in France

A NEW BRITISH MAGNETO.

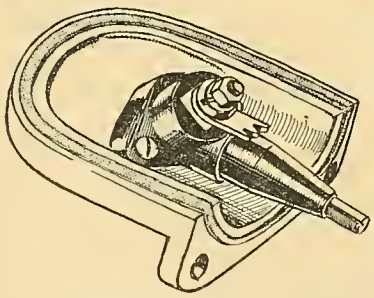
The B.T.H. Magneto—a Machine of Excellent Design and Construction.



The B.T.H., a new British magneto, described on this page.

THE magnetos in use in this country have hitherto been, almost exclusively, made abroad, the great majority coming from Stuttgart. We are glad, therefore, to be able to announce the advent of another thoroughly well made machine entirely of British manufacture.

The B.T.H. magneto, which we illustrate herewith, is made by the British Thomson-Houston Co., of Coventry, and is so designed that it can be interchanged with a Bosch of similar size; the magnets are, however, a quarter of an inch higher, which should be an advantage from an electrical point of view, as it should give a hotter spark at low speeds. The high-tension terminal, which we illustrate, is absolutely waterproof, as it contains a metal socket but no hole through into the interior; the same sketch also shows the spark gap. On the opposite side is a gauze covered window designed to allow any fumes caused by internal sparking, and which might damage the armature, to escape. This gauze is very fine and should be quite waterproof.



One end plate of the B.T.H. magneto removed to show spark gap terminal and reverse side of high tension terminal.

Lest anyone may have misgivings about the use of British made magnets, we may mention that the British Thomson-Houston Co. have for years been using magnets which do not vary more than .1% for scientific purposes, whereas the magnets of a magneto may vary as much as 10% (or 100 times as much) without detriment.

All the parts of the contact breaker are particularly substantial in construction and beautifully made, and as an instance of the great care which has been bestowed on all details, however small, it should be noted that the spring which holds the contact breaker cover in place is provided with a little handle and the oilers are fitted with ball valves.

The B.T.H. magneto forms a welcome addition to the somewhat meagre list of magneto machines produced entirely in this country.

THE GLENGARRIFF OPEN TRIAL.

The awards in connection with the two days' open reliability trial for the Dublin and District Motor Cycle Club Dublin to Glengarriff and back, which was reported in our last issue, have been made. The marks and placings of those who won awards were as follow:

G. Roche (3½ Rover)	200
S. Armstrong (6 Enfield sc.)	200
J. Browne (3½ Rover)	200
A. W. Mooney (6 Bradbury sc.)	200
F. M. Summerfield (6 New Hudson sc.)	200
W. H. Freeman (7 Indian sc.)	200
H. Macrea (2½ Imperial)	197
T. Toole (3½ Rover)	193
J. Doleman (3½ Rover)	182
R. Walshe (3½ Rover)	181
J. A. H. Waters (2¾ Douglas)	179
J. Clarke (4 Hobart)	178
J. F. A. Day (2½ Sun-Villiers)	176
S. Allen (3½ N.S.U.)	176
D. Morrough (Calthorpe c.c.)	174
T. J. Woods (3½ B.S.A. sc.)	165
J. O'Dwyer (2¾ Douglas)	162
H. W. Gibson (3½ Rudge)	121

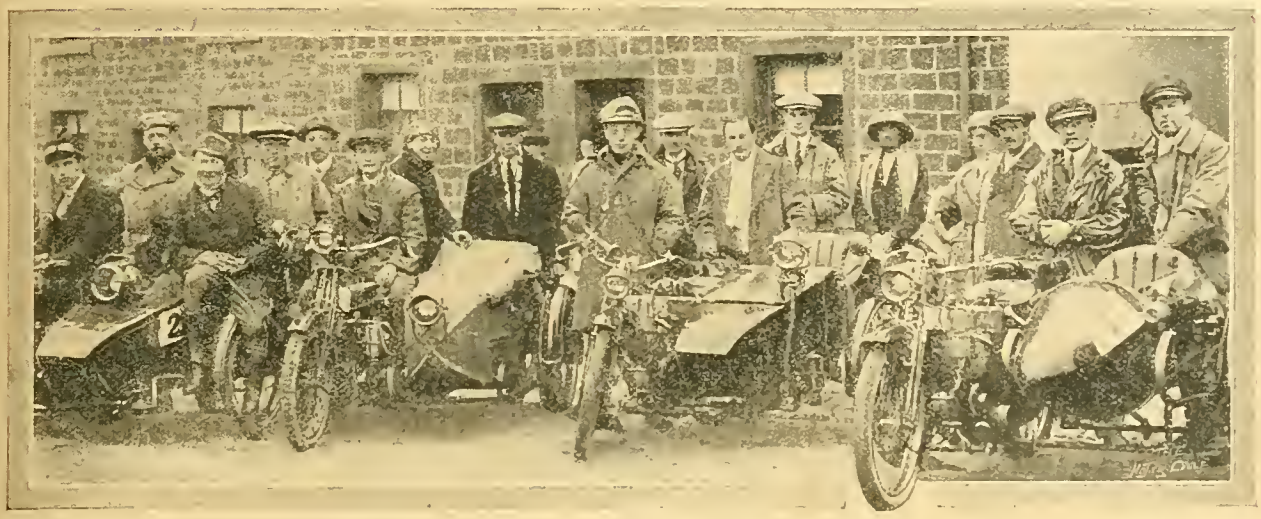
The special awards are as follow:

SIDECAR PRIZE (irrespective of horse-power).—W. H. Freeman (7 Indian).
SIDECAR PRIZE (under 500 c.c.)—T. J. Woods (3½ B.S.A.).
TEAM PRIZE.—Roche, Doleman, and Browne, all on 3½ Rovers.
PRIVATE OWNERS' PRIZE.—W. H. Freeman (7 Indian).
SINGLE GEAR PRIZE.—H. W. Gibson (3½ Rudge).

All of the competitors who secured the maximum number of marks, 200, were awarded first-class certificates and gold medals. A gold medal and a special extra certificate for meritorious performance were awarded to H. Macrea (2½ New Imperial), and silver medals were awarded to all the other finishers.

A 560-MILE TRIAL FOR A MOTOR BICYCLE.

The Bradford M.C. and L.C.C.'s Run to Brighton and Back.



A group of competitors in the Bradford M.C. and L.C.C. reliability run to Brighton and back

IN spite of the anxiety into which the country has been plunged by the war, no less than twenty-five riders started from Bradford in this trial to Brighton and back, and soon found that the trial was to be no child's play, for shortly after the first man had departed on his long journey the rain came down in torrents, and continued to do so for the rest of the night. The wind also was very troublesome, and in places had deposited small trees across the roadway.

Wind and rain, coupled with punctures and other minor troubles, made it hard for the riders to keep up to schedule time at the various unknown mile post checks. J. Sands (10 h.p. Singer) had gear trouble near the start and gave up, and Harry Reed (8 h.p. Dot sc.) had so much tyre trouble that he retired.

Difficulties on the Return Run.

The return journey, which took place on the 4th inst., was full of incidents. To begin with, petrol was four shillings per gallon, but the local manager for the Shell Co. arranged with garage proprietors for the necessary supply to the riders at normal price. Then war transports and soldiers were continually met, and W. Drake (3½ h.p. P. and M. sc.) was struck by the carrier of a passing machine and upset into the hedge. His passenger suffered most, but after attention they were able to continue. G. W. Jubb (4 h.p. Norton sc.) broke the gears, and H. Mawson (3½ h.p. Bradbury sc.) the front forks. J. Fearnley (6 h.p. Enfield sc.) was being considered a likely winner of the machine offered as a prize, when almost within sight of home he suffered a succession of bursts and punctures, which threw his calculations all wrong.

THIS WEEK "THE MOTOR CYCLE" IS ABLE TO PROVIDE ITS READERS WITH PHOTOGRAPHS AND WAR NEWS FROM ALL DISTRICTS. MOTOR CYCLISTS ARE PLAYING A MOST IMPORTANT PART IN THE PRESENT WAR, AND SPACE COMMENSURATE WITH THE IMPORTANT WORK OF MILITARY MOTOR CYCLISTS WILL BE DEVOTED TO THEIR DOINGS (SO FAR, OF COURSE, AS IT IS WISE AND PRUDENT TO DIVULGE THEM).

RESULTS OF M.C.C. TOUR.

The following are the results of the Motor Cycling Club's hill-climbing trial and holiday run, held on August 1st and 3rd :

	Porlock. m.p.h.	Countisbury. m.p.h.
WINNER OF CUP (SOLO CLASS).		
G. P. Howe (4 B.S.A.)	13.86	14.59
WINNER OF CUP (SIDECAR CLASS).		
H. G. R. Slingo (5-6 Clyno sc.)	14.91	15.49
GOLD MEDALS.		
L. A. Baddeley (3½ P. & M.)	12.06	16.75
J. S. Holroyd (3½ Blackburne)	12.61	14.35
W. H. Longton (3½ Alldays)	14.33	16.83
Victor Cook (7 Matchless sc.)	12.78	17.18
H. E. Parker (6 Bradbury sc.)	12.77	16.04

In addition to the above, twenty-eight silver medals have been awarded.

A double-seated sidecar fitted to an 8 h.p. Leader-Precision. This combination, driven by Eli Clark, succeeded in gaining a gold medal in the recent Bristol B & M C trial to Land s End and back

Keeping Open Lines of Communication.

We have heard from Hugh Gibson, the well-known competition rider, that he is organising a small motor cyclist corps for home defence purposes at Ainsdale, Lancs., and that he is in communication with the Cumberland M.C.C. and Edinburgh and District M.C. to secure co-operation. The idea is to enable rapid communication to be kept up between Liverpool and Edinburgh by motor cycle riders in the event of the telegraph or railways breaking down.

Motor Cyclist Volunteers.

Hundreds of names of motor cyclists willing to act as despatch riders have been received by *The Motor Cycle* in reply to our appeal on behalf of the War Office last Thursday. These names have all been classified according to the districts in which the applicants reside, and particulars of the machines have been noted. In some cases applicants have offered the services of their machines when they themselves are incapable of riding. In others riders have offered their services who have no machine at their disposal. The list of names is being compiled in conjunction with the Auto Cycle Union, which body is directly in touch with the War Office, and at a moment's notice can give the officials there the names of the motor cyclists available in any district in the United Kingdom.

A.A. and M.U. Notes.

THE PETROL POSITION.—In the interests of motorists the A.A. and M.U. have made exhaustive enquiries into the present position relating to petrol, from which it would appear that there is no shortage in the supply so far as bulk storage is concerned. At the present time, however, owing to the commandeering by the Government of motor lorries and to the congestion on the railways, great difficulties exist in getting supplies to the retailers. In addition, there is a shortage of tins, apparently due to motorists increasing their reserves, and deliveries would be considerably facilitated if empty tins are returned to garages at the earliest possible moment. The increase in price is not recognised by the producers, but in the case of motorists calling at garages other than where they usually do business higher prices are undoubtedly asked. For this reason the A.A. recommends members to order their petrol from the agent with whom they usually do business. There can be no doubt that the present position will be considerably relieved if members will temporarily exercise the most rigid economy, and do everything possible to prevent tins being withdrawn from circulation.

OUR ADVICE TO CLUBS.

At a time when every motor cyclist is anxious to serve his King and Country, and when all army vacancies are for the present filled, the advice of "THE MOTOR CYCLE" to Club Committees is to encourage members to cultivate assiduously an intimate knowledge of their own particular localities and to become well versed in the art of map reading, so that, if their services may be required eventually, they will be as useful as possible.

Ordinary competitions having been cancelled, Clubs might well arrange map reading contests and reconnaissance tests in districts not occupied by troops.

STUDYING THE MAP.
An incident of the operations in Suffolk. The machine is a twin A.J.S.

SPECIAL FEATURES.

MOTOR CYCLISTS AND THE WAR. HOW TO CUT DOWN RUNNING COSTS. A NEW BRITISH MAGNETO.

Work upon the Roads.

The disorganisation of business consequent upon the European War will undoubtedly throw many labourers out of work. As the Road Board has a considerable sum of money to provide work at such times it is desirable that the authorities should know in what places this labour could be most usefully employed. Secretaries of motor cycle clubs are, therefore, asked to request their members to make notes respecting improvements which seem to be most necessary, preference being given to schemes for widening, strengthening, and resurfacing of trunk roads where the minimum of land is required, or where it can be obtained without much difficulty, and to send these notes to the Roads Improvement Association, 15, Dartmouth Street, Westminster, S.W. If possible, the notes should be summarised by the secretaries and copies of the summaries sent to the Association.

Imports and Exports of Motor Cycles.

The value of the imports of motor cycles and parts thereof are as follow:

For month ended July 31st—

	1912.	1913.	1914.
	£	£	£
Motor cycles ...	4,857	2,640	6,675
Parts	13,444	16,204	13,159
Totals ...	18,301	18,844	19,834

For seven months ended July 31st—

	1912.	1913.	1914.
	£	£	£
Motor cycles ...	29,685	42,124	73,651
Parts	70,736	123,522	78,503
Totals ...	100,421	165,646	152,154

The value of the exports is, as usual, much in excess of the imports, and is given below:

For month ended July 31st—

	1912.	1913.	1914.
	£	£	£
Motor cycles ...	43,148	71,287	89,805
Parts	13,051	23,737	36,055
Totals ...	56,199	95,024	125,860

For seven months ended July 31st—

	1912.	1913.	1914.
	£	£	£
Motor cycles ...	238,459	440,942	557,440
Parts	87,238	142,768	216,626
Totals ...	325,697	583,710	774,066

Belgians to the Front.

Many Belgian volunteers on their way from Paris to their own country left on sidecar combinations with their wives, sisters, and children, all bedecked with flowers as if on a holiday jaunt.

Open Events Cancelled.

It is likely that the majority of open trials in the near future will be cancelled, owing to the war. News of two trials already cancelled are the Bristol M.C.C. event on September 4th and 5th to Land's End and the Liverpool A.C.C. London and back run arranged for the 15th inst.

The Aliens Restriction Order.

The Aliens Restriction Act, which was passed through Parliament last week, places alien enemies under certain disabilities in respect to the possession of firearms, motor cars, *motor cycles*, petroleum, and other articles, and requires them to register themselves with the police under stringent penalties.

A Gymkhana in the Midlands.

A gymkhana is to be held at Wellesbourne to-day (Thursday, August 13th) in aid of the St. Mary's Aston Brook Aid Scheme. There will be five events for motor cycles and sidecar outfits besides many other attractions, and the meeting will take place on the cricket ground. It is hoped that some exhibition riding will take place.

English Lady Motor Cyclists in Germany.

Two young lady motor cyclists, Miss Scott and Miss Dickenson, Wootton, Isle of Wight, have arrived home from a tour in Germany after suffering terrifying experiences. They were arrested three times as spies, hauled off their machines, and roughly handled. Although they showed duly authenticated passports they both lost their motor cycles at Frankfurt, where they were requisitioned for war purposes.

Motor Cycles in Italy.

We have called attention on several occasions of late to the advance in the sporting and business side of the motor cycle movement in Italy, which is quite a valuable market for British manufacturers, and nearly forty makes from this country are now represented there. Some admirable machines are also produced in Italy itself, the Della Ferrera, of Turin, the Borgo, also made in Turin, and the Frera, of Tradate, having done wonderfully well in racing events this year. There are about 16,000 motor cycles running in Italy at the present time.

Last Quarter's London Registration.

During the quarter ending June 30th applications for the registrations of 4,667 motor cars, 204 heavy motor cars, and 2,887 motor cycles were dealt with by the London County Council, bringing up to 78,666, 6,826, and 33,048 respectively the number of these vehicles registered since the Motor Car Act, 1903, came into force. Changes of ownership in 2,451 cases were dealt with, the total number of such changes registered being 26,146 cars and 16,059 cycles. The number of licences to drive motor cars and cycles issued was 22,201, bringing the total number up to 352,163.

A Young Motor Cyclist.

On the Folkestone-Boulogne boat the other day there was a French boy of fourteen, a well-built lad who spoke English with ease, who was returning to France in the hopes of obtaining a motor cycle and becoming a despatch rider.

The Registration of Auto-Wheels.

For the purpose of registration under the Motor Car Acts, the London County Council has agreed that an Auto-Wheel be registered apart from the machine to which it is attached, and that no further registration fee be required on the removal of the Auto-Wheel to another machine.

Mechanical v. Automatic Inlets.

Looking back through past years of this journal, one receives many a reminder of the danger of prophecy. A decade ago a technical article was published by a well-known A.M.I.M.E. on the advantage or otherwise of the use of mechanically-operated inlet valves on motor cycle engines. After a careful investigation into the claims of the m.o.i.v., then struggling to come into its own, the writer dismisses the claims of this type on the score of its being a useless complication on an engine, and also on the ground that much flywheel inertia was wasted in driving the cams. We will not give the writer's name, for we have no doubt that he has long ago changed his views. To our mind it is wonderful that the a.o.i.v. lasted as long as it did, for we well remember about ten years ago riding a machine fitted with an early m.o.i.v. White and Poppe engine, and being greatly impressed at the power produced in comparison with our mount of that period, which had a first-class engine with the older type valve.

Price of Petrol.

Boycott all garages at which highly increased prices are asked for petrol. There is no authority for increase at present, and the two leading suppliers assert that the stock is sufficient for all ordinary demands.

Danger in Cheapness.

An application has recently been made in Wanganui, N.Z., for a licence to ply for hire with a motor cycle and sidecar. The borough engineer opposed the application on the grounds that he did not consider a motor cycle and sidecar a safe conveyance! Pressed further, he thought the cheaper rate charged would disorganise the cab trade.

Important Continental Events Cancelled.

The Motor Cycle Grand Prix Race at Le Mans, for which a representative English entry had been received, is automatically cancelled owing to the war.

Though we have heard nothing official as yet regarding the third Anglo-Dutch Trial arranged to be held in Holland September 6th to 9th next, it is practically certain that the event will have to be postponed until next year.

Unofficial Record Attempt.

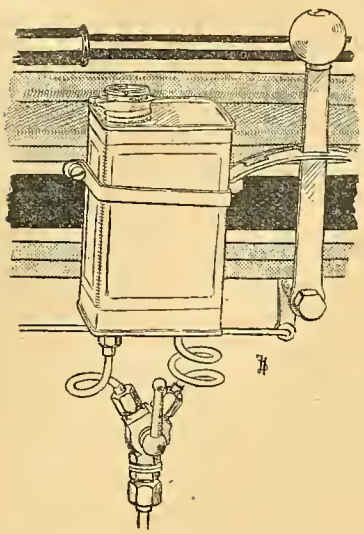
Last week an attempt was made on the End-to-end sidecar record by two Oldham motorists, Noah Oliver and Isaac Cotton, mounted on a 6 h.p. Bradbury. The first intimation of the attempt was the receipt of records of progress at *The Motor Cycle* offices, but the attempt was abandoned owing to the bad weather. We have since pointed out to the driver the risks he is running with the police and the A.C.U. in attempting such a record, and seriously we would advise him to offer his services to the Government as a despatch rider if he is anxious to show his speed proclivities.

A GLIMPSE OF THE DEVONSHIRE COAST FROM COUNTISBURY HILL.
Observe the rider on an Exmoor pony taking a buckled wheel into Lynmouth for repairs. This incident occurred during the M.C.C. Devonshire tour.

TWO-STROKES AND PARAFFIN.

An Interesting Practical Experiment.

OWING to the possible shortage of petrol in the future and the difficulty of obtaining it at reasonable prices, a member of our staff has been carrying out experiments with paraffin on his two-stroke Clyno. A quart can has been fixed to the tank to act as a petrol container for starting purposes, and the petrol tank proper was drained and filled with quite a low-priced paraffin. A three-way tap was fitted to the petrol pipe in a convenient position, and connected up to both tanks and the float chamber in the usual manner. Preparations were now complete, and the machine was taken on the road. An attempt to start on the paraffin from cold failed, as was expected, but only a float chamber full of petrol was required to warm up the engine before it took up its work on paraffin, and showed but little alteration from petrol. The mixture was slightly more tricky, and until the engine was thoroughly warm there was a slight tendency to blow back into the crank case. Subsequently the float level was altered to suit the heavier fuel, and a slight improvement was noticeable at once. At the present time paraffin is being used on the little two-stroke regularly, and no evil results are apparent nor is there any perceptible difference in power.



Showing how an oilcan may be fixed on the tank for carrying petrol for starting purposes, the main tank being filled with paraffin. The Clyno tank is particularly convenient on account of the holes in the tank.

Those who wish to try the experiment for themselves should remember to switch on to petrol a short time before stopping the engine, so as to have a float chamber full of petrol for starting purposes. The standard Amac carburetter as fitted to the Clyno is employed, though the warming device is not at present in use. An improvement in running is expected when it is refitted.

THE 3½ h.p. A.B.C.

One of our staff has recently been sampling a 3½ h.p. A.B.C., and in a paragraph written after the A.C.U. Six Days Trials, which he followed on this machine, we remarked that it was a new and untried production, meaning thereby that it had not yet won its spurs in any road trial. We would like to take this opportunity of stating that the new A.B.C. is well past the experimental stage. At Brooklands it has proved itself as a racing machine, and has undergone many private road tests, which have assured its manufacturers that it is right in every respect. That this is so was amply proved by the manner in which the machine behaved itself in our hands during the excessively severe A.C.U. Six Days Trial. There is no question of doubt that steel cylinders are in every respect successful (incidentally, the three winning Mercédès cars in the Grand Prix Race had steel cylinders), and the engine kept cool and was never once heard to knock, even under the worst provocation; it ran very smoothly, had excellent powers of acceleration, and a fine turn of speed on the level. The springing was most efficient, and the machine finished, notwithstanding the buffeting about it received over the appalling roads, in perfect condition. In about three weeks time A.B.C. Road Motors, Ltd., will move into their new works at Hersham, and hope to deliver these machines in large numbers next year.

Motor cyclist despatch riders are largely in evidence in East Anglia. Our illustrations show one of the detachments taking up their positions. The motor cycles in this corps are, incidentally, mainly composed of powerful V-type twins.

ELECTRIC LIGHTING.

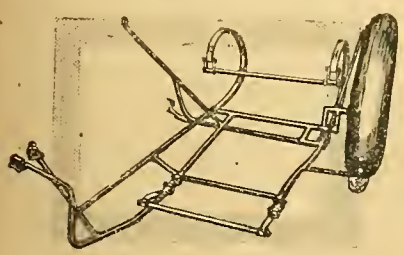
A Zenith machine belonging to Mr. M. Abraham, of Grove Lodge, Muswell Hill, has recently been equipped with a lighting set supplied by A. H. Hunt, 115, Cannon Street, E.C., and it is shown in the accompanying illustrations. Two head lights are provided, one being attached to the handle-bars and the

A. H. Hunt's electric head lights and dynamo fitted to a twin Zenith.

other to an extended bracket. The current is obtained from a set of Alklum accumulators that are housed in a wooden case attached to the carrier. Three switches are also provided outside the box, one being for the tail lamp and the other two for the head lights. A small auxiliary dynamo is driven off the front wheel and can be used in the case of an emergency.

THE F.N. SIDECAR.

The new F.N. sidecar chassis possesses many salient features, the two most prominent perhaps being the sound construction and the four-point attachment. Dealing with the former, it will be noticed, on referring to the illustration, that welded joints take the place of the more usual brazed lug type. One of the extra couplings fitted is anchored to a special lug cast on the bottom of the bevel housing. A similar lug is also provided on the opposite side of the

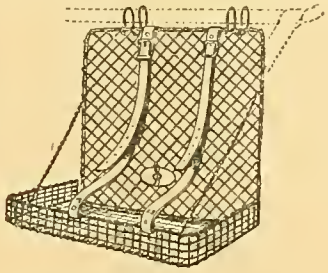


Chassis of the new F.N. sidecar

machine for sidecars as used on the Continent, attached on the right-hand side. A double axle is also utilised, and the sturdy construction of the mudguard and stay is very commendable. The bodies are designed exceedingly well and on really pleasing lines, and can be supplied with either a blue, grey, or green finish.

A USEFUL LUGGAGE GRID.

Motor cyclists are often troubled with the problem of carrying luggage, and Messrs. John Piggott and Son, Ltd., 117,

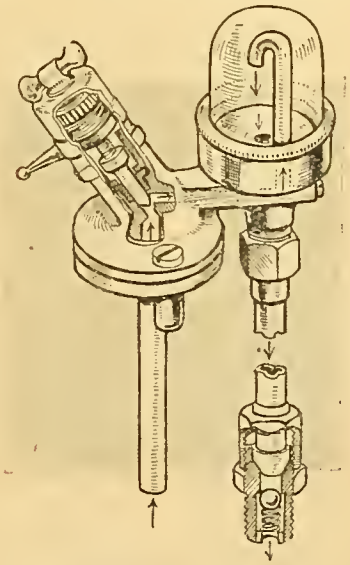


John Piggott's luggage carrier.

Cheapside, E.C., have brought out a very neat paunier grid, which we illustrate. This is easily attached to the side of the carrier, and with it a large bag can be carried without any trouble.

THE ENOTS LUBRICATOR.

Messrs. Benton and Stone, Ltd., Enots Works, Birmingham, have introduced an improved form of their drip lubricator. It will be seen that the small ball valve is screwed into the crank case, and is attached by means of a pipe to the sight drip feed itself, which is

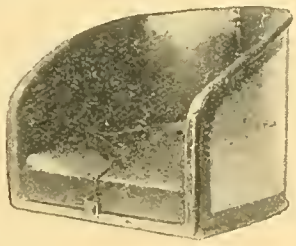


Semi-sectional view of Enots lubricator

covered by a small glass bowl. On the up stroke of the engine piston a vacuum is formed in the crank case as well as in the small glass bowl, and oil is drawn up from the oil tank and passes on its way through the small valve controlled by a screw. Not only can the rate of the flow be controlled by this small valve, but an extra lever is provided, by means of which the whole can be turned off without altering the rate of the flow

A NEW PILLION SEAT.

A comfortable upholstered pillion seat is being marketed by Messrs. Stokes and Holt, Ltd., Belgrave Road, Leicester.



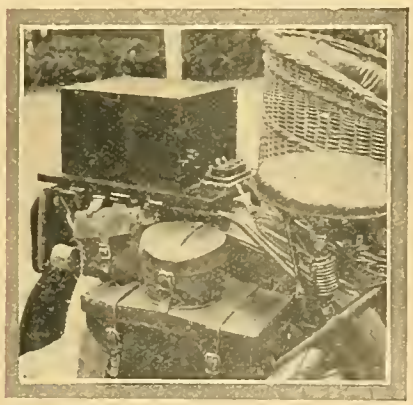
Stokes and Holt pillion seat.

It is bolted to the carrier by means of two iron plates, and the passenger is secured by means of a stout strap. For riders of powerful sidecar machines desirous of taking a third passenger this seat should prove admirably adapted.

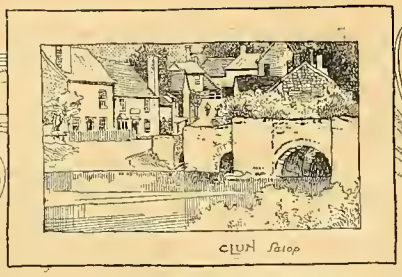
A NEW OVER-BOOT.

Being aware that there is an increasing demand for a light serviceable over-boot for motor cyclists, the North British Rubber Co., Ltd., 169, Great Portland Street, W., have introduced an article which should meet with the very hearty appreciation of all-weather riders. The boot is manufactured of the best material and workmanship, and the price is a reasonable one. It will be noted that it may be put on very easily, as it is slit down the back and fastens with glove button fasteners.

The North British Rubber Co.'s new overboot.



Alklum accumulators forming part of Hunt's electric lighting set, described on this page.



CLUB NEWS

"THE MOTOR CYCLE" LIST OF CLUB EVENTS.

The following is a list of the fixtures for the coming week, but owing to the European war we are daily receiving advice of postponement of all kinds of events, and it is possible that those given below may not be held.

Aug. 15th.—Dublin and District M.C.C. Club reunion tea at Howth.
„ 15th.—Ripon and District M.C.C. Week-end to Scarborough.
„ 15th.—Westmorland M.C.C. Hill-climb at Orton Scar, 3-30 p.m.
„ 15th.—Malvern M.C.C. Inter-club speed trial at Blackmore Park.
„ 15th.—Woolwich, Plumstead, and District M.C.C. Inter-team trial for Woolwich Challenge Cup, starting 10 a.m.
Aug. 15th.—Middlesex M.C.C. Social run to Broxbourne.
„ 17th.—Plymouth and District M.C.C. General meeting at the Rock, 8 p.m.
„ 19th.—Cardiff and District M.C.C. Hill-climb.
„ 19th.—East Essex M.C.C. Non-stop run.
„ 19th.—Bournemouth and District M.C.C. Riverside garden party.

Essex M.C.

The race meeting arranged for Saturday next, 15th inst., at Brooklands, has, owing to the national crisis, and the club not being able to obtain the use of the track, been cancelled.

Troedyrhiw and District M.C.C.

The reliability trial, which was to have taken place last week, has been indefinitely postponed owing to the European crisis.

West Hants M.C.C.

The reliability trial which was to have been held on the 29th inst. has been postponed, owing to the state of war in Europe.

Finsbury Park C. and M.C.

A hill-climb was held on the 3rd inst. at Whitchurch Hill, near Pangbourne, and was won on formula by C. W. Cooke (3½ Triumph), with J. Evans (5 Bat) second, and T. O. Manning (3½ Bradbury) third. This event, together with the speed-judging competition which is to take place on the 22nd inst., decides the holder of the challenge cup presented by Mr. G. A. Touche, M.P.

Plymouth and District M.C.C.

The winners in the trial from Penzance to Plymouth, which took place on the 3rd inst. (ninety-six miles, three checks), are as follow :

	Marks.		Marks.
F. Jewers (Crescent c.c.)	100%	A. Brand (6 Hobart)	97%
W. J. Pitts (8 Chater-Lea) ...	100%	E. J. Jarvis (2¾ Douglas)	96%
T. D. A. Chapman (8 Bat)	98%	C. R. J. Roberts (6 Matchless)	95%
F. E. Jarvis (2¾ Douglas)	97%		

Cork and District M.C.C.

Last week's reliability trial included a flexibility test and two observed hills—Gowlane Hill, near Kenmare (which caused several failures in the End-to-end trial, and on the Dublin two days' trial was considered an unfair test for passenger machines, so that only the solos were sent up, and ten of them failed), and Ballagisheen Pass (which caused a good many failures in the Cork open event earlier in the season). However, all the eighteen starters, including six sidecar machines, made clean ascents of Gowlane, and the sixteen who reached Ballagisheen also accounted for this hill. A figure of merit of 3.5 qualified in the flexibility test; formula, $\frac{\text{slow time}}{\text{fast time}}$

First-class Awards.—R. S. Russell (7 Matchless sc.), E. MacSweeny (6 Sunbeam sc.), C. Kristien (6 A.J.S. sc.), P. J. Cox (3½ Douglas), R. B. Baker (2¾ Douglas), G. H. Ogilvie (4 Triumph), C. S. Hosford (3½ Rover), M. English (2¾ Douglas), and H. Dooly (3½ Zenith), no marks lost; G. H. Haynes (2¾ Douglas), 1 mark lost.

Second-class Awards.—D. Parbury (4¼ Excelsior sc.), M. J. Cox (2¾ A.J.S.), J. Atkinson (Baby Triumph), and M. Ahern (Enfield).

P. J. Cox wins the Gibson Cup, having the least variation from 20 m.p.h. over a timed distance.

FORTHCOMING OPEN EVENT.

Coventry Open Hill-climb.

The ninth annual open hill-climb of the Coventry and Warwickshire M.C. will be held on the 29th inst., commencing at 12 o'clock. The locality of the hill will be announced some time before the event. Every machine in the touring classes must be fully equipped, or it will be transferred to the open class. No entries will be accepted from ladies. *The Motor Cycle* formula will be used, and prizes will be awarded for the fastest time (expert) and for the best performance on formula (general). Entries must be sent to Mr. H. Whiteman, secretary, Grey Friars' Chambers, Hertford Street, Coventry, not later than the 21st inst.

Classes.

1. Auto Wheels. Note.—In this class a prize will be awarded to the competitor who reaches the highest point of the hill (pedalling not allowed).
2. Standard pattern touring two-stroke lightweights, engines up to 225 c.c.
3. Standard pattern touring two-stroke lightweights, engines up to 350 c.c.
4. Standard pattern touring four-stroke lightweights, engines up to 250 c.c.
5. Standard pattern touring four-stroke lightweights, engines up to 350 c.c.
6. Standard pattern touring motor cycles (single and twins), two and four-strokes, engines up to 500 c.c.
7. Standard pattern touring motor cycles (single and twins), two and four-strokes, engines up to 750 c.c.
8. Motor cycles, two and four-stroke (open class), engines up to 1,000 c.c.
9. Sidecar combinations, engines up to 750 c.c.
10. Sidecar combinations, engines up to 1,000 c.c.
11. Cycle cars, engines up to 1,100 c.c.

HILL-CLIMB AT THE CAPE.

The C.P.M.C.C. held the July competition on the 11th over the difficult course leading to the Kloof Nek. It consisted of a flexibility hill-climb. Seventeen riders entered upon the 500 yards slow climb, after which they had to accelerate and continue at speed to the top of the hill.

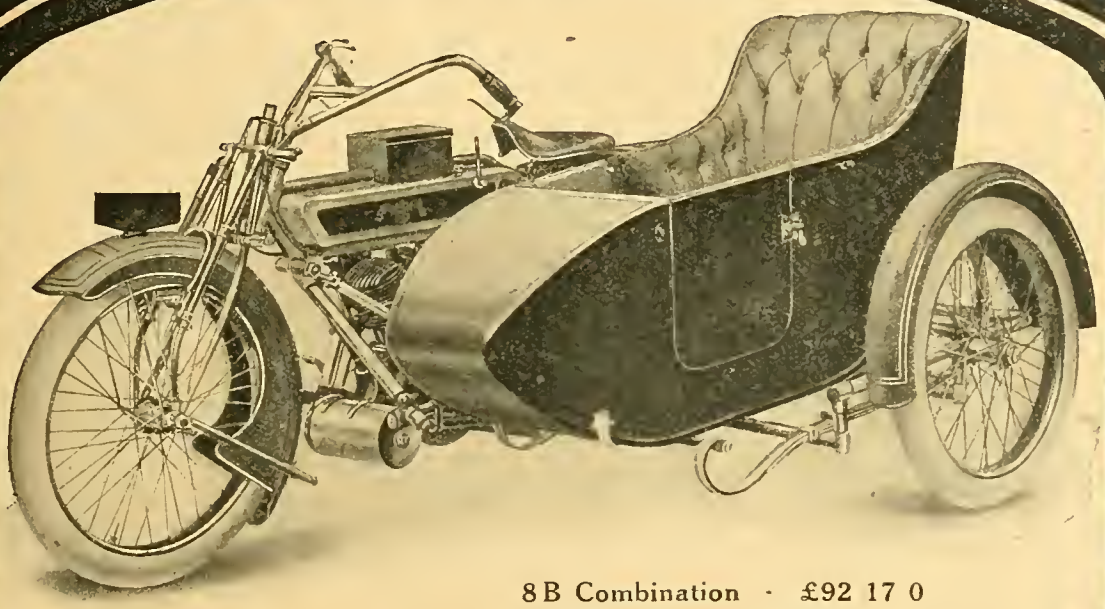
Nelson Clark (7 Indian) made the best time, 1m. 59⅕s., on the fast portion, while E. Watts (6 Enfield sc.) took 2m. 13s., his splendid corner work calling forth a cheer from the crowd. The two acute 1 in 4 hairpin bends proved the undoing of many. J. Berl (2¾ F.N.) came down at the first bend, but remounted and repeated the performance at the second, this time damaging part of his machine.

O. Prillevitz (3 Enfield), who had just returned from competing in the Johannesburg-Durban race, met his fate, as five of his clubmates did, just past the second hairpin.

The results were as follow:

1. F. Johnson (3½ Sunbeam).
2. W. Boyliss (3½ Premier sc.).
3. H. O. M. Lewis (3½ Humber).

MATCHLESS



8 B Combination · £92 17 0

THE MOST SUCCESSFUL SIDECAR COMBINATION OF THE SEASON.

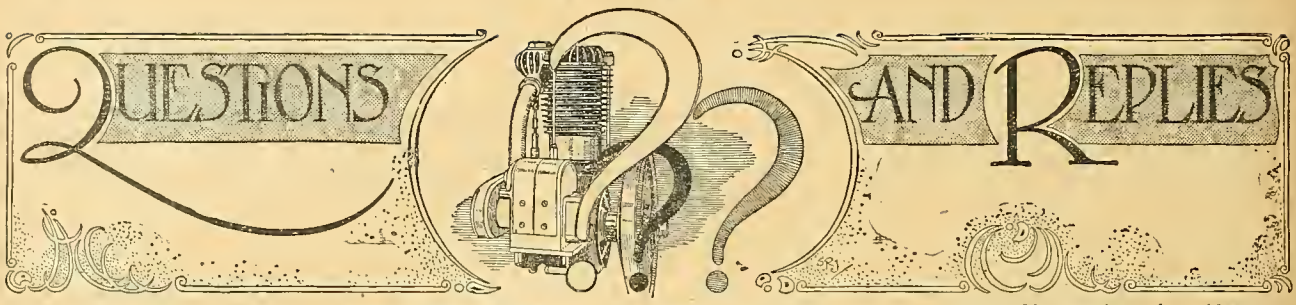
The Combination illustrated above, represents the highest class Sidecar outfit at present on the market.

BRIEF SPECIFICATION:

7 h.p. Twin Engine; Semi-automatic Carburetter; Waterproof Magneto; Large Tank; Three-speed Countershaft Gear, with indestructible metal free engine clutch and gate change; Silent Chain Drive entirely enclosed; Automatic lubrication from engine to clutch and chains; Car Tyres all round; Folding Luggage Grid; Spring Petrol Can Carrier, etc.

THE MOST SILENT MACHINE ON THE ROAD.
ASK YOUR AGENT FOR FURTHER PARTICULARS

H·COLLIER & SONS, LTD PLUMSTEAD·S·E·



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Tuning for Speed.

Q. Could you inform me what size jet in the carburetter of my 1911 Triumph would probably give the fastest speed, irrespective of petrol consumption? At present I use a 38 jet. On a good road, in good touring trim, what speed should the machine be capable of on a 5½ to 1 gear?—IP 292.

It is impossible to give you a set size of jet for the fastest speed, as it depends entirely upon the type of carburetter and the size of choke tube. Again, with an older engine it is impossible to get the high number of revolutions that you can out of a more modern one, and it is therefore impossible to use such a large jet as can be used nowadays. We should advise you to get three or four jets and hit upon the right one by trial. Such a machine as you have should be capable, when in good tune, of attaining a speed of about 45 m.p.h. on a 5½ to 1 gear.

Carburetter out of Tune.

Q. I have a 3½ h.p. single-cylinder sidecar combination, and owing to a cracked piston and loss of power I had it rebored and a new piston fitted, since when there has been excessive consumption of petrol and loss of power, while now it will not do more than thirty miles to the gallon. The valve timing is set for the exhaust valve to shut when piston is dead on top, and the inlet to open immediately the piston descends. The magneto points are about to break when the piston is on top of stroke with the lever two-thirds retarded. I have fitted stronger springs on inlet and exhaust, also new guides, but to no purpose. There is also a low level in the float chamber, and I have fitted a wire gauze over the air hole, but no improvement has resulted. I use a 31 jet, and have also tried a 38 jet, which caused knocking on the slightest hill. Can you suggest any improvement?—A.J.P.

It seems that your carburetter is quite out of adjustment, as the consumption is very excessive. You might test the inlet pipe for air leaks, as such leaks would give you the symptoms from which you are suffering. The valve timing is quite correct, but we think that you might make a slight alteration in the ignition timing. Try setting the magneto points to be on the break when the piston is on top dead centre and the lever fully retarded. You might also try a slightly higher petrol level in the carburetter.

Poor Engine Balance.

Q. I have a 1914 4 h.p. chain drive counter-shaft three-speed motor cycle. When running at, say, 30 m.p.h. and over there is very bad vibration of the handle-bars, and I also feel it, but to a lesser degree, on the footrests. The fork link bolts are not at all tightly locked, and I do not drive with a hard front tyre. Could you suggest a cause for this?—T.R.G.

The trouble you are suffering from is due to a "period" in the engine, caused by lack of correct balance. To locate the source of this trouble would be a very difficult matter, and we are afraid we cannot give you much help. It can only be cured by taking down the engine and verifying the balance of the reciprocating parts. We published some interesting articles some time ago on balancing engines, and these have now been issued in booklet form, and can be obtained from these offices price 7d. post free.

A Three Days Tour to the North.

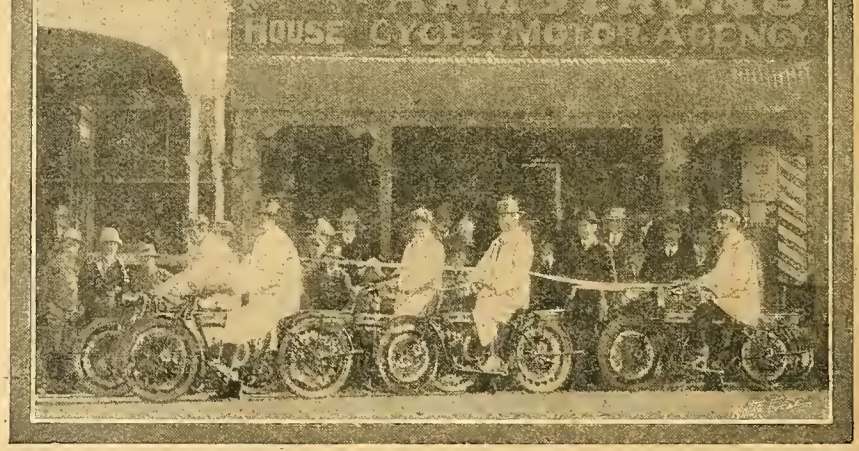
Q. I want to go by motor cycle from Sunningdale (Berks) to Duns (Berwickshire), and I should be much obliged if you could let me know the best route to take, avoiding London. I wish to spend three days over it, stopping the night twice.—H.W.S.

This would prove an easy three days run, mostly over good roads. We should recommend you to go from Sunningdale to Staines, and then *via* Uxbridge, Denham, Rickmansworth, Watford, St. Albans, Hatfield, Welwyn, Stevenage, Baldock, Biggleswade, Eaton Socon, Buckden, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Doncaster, Ferrybridge, Wetherby, Boroughbridge, along Leeming Lane, through Scotch Corner to West Auckland, Towlaw, Corbridge, Carter Bar, Jedburgh, Kelso, Greenlaw, Duns. We should advise you to stay at Newark and West Auckland.

A Gear Query.

Q. I am having a slight trouble with a three-speed hub on my 3½ h.p. single-cylinder machine, which, up to a recent date, has given great satisfaction. When travelling fast or going up hill the clutch appears to slip momentarily and engage again very suddenly with a slight jerk.—S.W.H.

You do not state whether your trouble occurs on all gears or only on top. If the latter is the case it is probably due to a rather weak return spring in the gears and not to the clutch actually. A new spring will affect a cure, though the matter should be seen to at once before the dogs become damaged.



A novel advertisement. The Armstrong Agency, which handles the Douglas in Perth (Australia), arranged a team of machines which were ridden through the town connected by streamers as above.

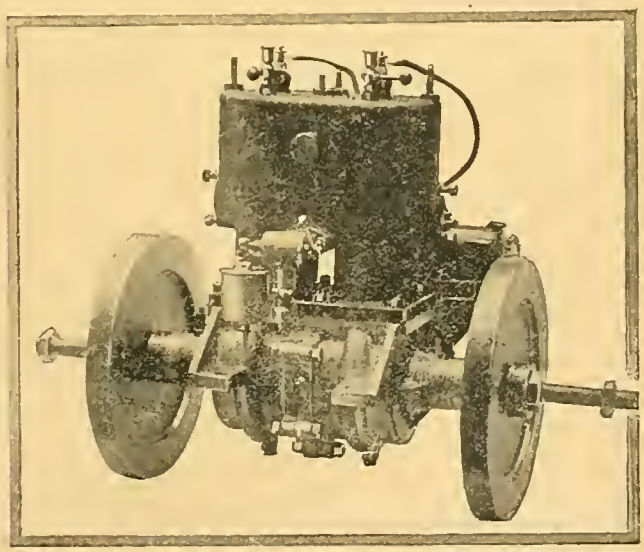
A party of M.C.C. members at Hungerford during that Club's Bank Holiday Tour

A reliability team trial took place on the 3rd inst. in the New Forest between members of the Southampton and District M.C.C. and Portsmouth and District M.C.C. The distance covered was 106 miles on a circular course through Cadnam, Ringwood, and Fordingbridge. The Southampton team proved to be the winners by one mark only, Portsmouth A team being second.

A Cycle Car Two stroke Engine.

IT is somewhat surprising that the two-stroke engine is rather more the exception than the rule in cycle car design, but there are, of course, one or two excellent products in this respect which are bound to come into their own in the near future. One of these is the Cycaren, manufactured by Messrs. T. Dickens and Co., 11, High Street, Fulham, S.W., which is a thoroughly sound engineering job. Two models are made which only differ in one or two details, one of them being rated at 6.5 h.p., while the other is known as the 9.5 h.p. type. Both are twin-cylinder units, the latter having the cylinders cast *en bloc*. The illustration shows what a remarkably clean appearance the engine presents. With a bore of 88 mm. and a stroke of 90 mm. the power developed is 9.5 at 1,000 r.p.m., and the range of speed claimed is from 300 to 2,000 r.p.m. In this design three crank bearings are essential, but the proportions in this case are excellent. The inlet gas passes between the cylinders, and is therefore warmed extensively before the final induction. Water cooling is carried out on a most liberal basis, for even at the narrowest points between the cylinders there is at least an inch of water space. It should also be mentioned that both the inlet and exhaust ports are made with very large effective areas, which have grids cast in them in order to prevent the three rings (two at the top and a scraper) from catching. Carburation is performed through the medium of a B. and B. carburetter. Mea plugs and magneto are responsible for the ignition.

The lubrication system is extremely thorough. The cylinder relies on the lubricant mixed with the petrol, while unions are fitted to both of the crankshaft bearings, and through these oil is conducted along a drilled passage in the crankshaft to the big ends. A separate feed pipe looks after the central journal, and the result of all these provisions should be a considerable prolongation of life of the bearings.



The Cycaren, a vertical twin-cylinder water-cooled two-stroke engine for use on cycle cars

A Strenuous Test.

In the annual run of the Bristol B. and M.C. to Land's End and back a fine performance was accomplished by Eli Clark, who went through the event on a Leader motor cycle with double-seated sidecar. On both outward and homeward journeys terrific rain storms prevailed and rendered the roads very heavy. In spite of this the Leader, which was equipped with an 8 h.p Precision engine, gained a gold medal.

An Excellent Lubricant.

Again, users of Castrol motor oil have scored an unqualified success, this time in the Irish End-to-end Trials. Users of this oil were successful in gaining every prize and medal with the exception of two gold medals.

Gear Prices Reduced.

The demand for the Bowden two-speed gear for motor cycles has increased to such an extent that, with increased facilities for manufacturing, Messrs. Bowden Wire, Ltd., London, N.W., the makers, have been able to arrange for a considerable reduction in the price. The cost of the standard gear has been reduced from £10 10s. to £8 8s., and for the special models arranged for Triumph, B.S.A., and Bradbury machines from £11 to £9.

Comfort on Motor Cycles.

We published lately an account of the Little Giant motor cycle, and one of the models illustrated was shown fitted with special Hammock footrests and pannier boxes. We did not mention the fact that the patents for these two fitments are held by the Kumfurt Motor Accessories Company, Cookham Rise, Berks, and are known as the Waigh patents.

Wins on Blackburnes.

Messrs. Burney and Blackburne, Ltd., Tongham, Surrey, have issued a poster giving particulars of recent successes gained on the Blackburne motor cycles manufactured by them. These include gold and silver medals won in the principal competitions of 1913 and 1914. The Blackburne machines are notable for the fitting of a large outside flywheel, detachable cylinder heads, and solid crankshafts.

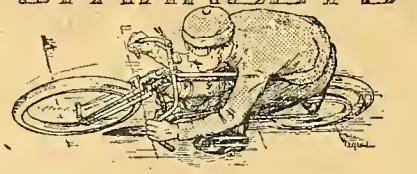
Good Value in Two-strokes.

In a recent description of the two-stroke Invicta motor cycle we inadvertently gave the price at 25 guineas. It should be 28 guineas, at which figure the value offered is remarkable. The makers are Messrs. A. Barnett and Co., West Orchard, Coventry.

Lathes for Polar Work.

The realms of sport and exploration are often in closer touch with one another than most are aware. The repair shop, so often neglected by the motorist, is fitted out by the Antarctic explorer in a precisely similar manner to that of the private garage. The Shackleton Antarctic Expedition, which is just about to leave the South-west India Dock, will take a 3½in. centre Drummond screw-cutting lathe, a sensitive drilling machine by the same firm, and an equipment of small tools such as you would find in the average motorist's workshop. It is interesting to note that the late Captain Scott took one of these lathes on his last expedition.

SPARKLETS

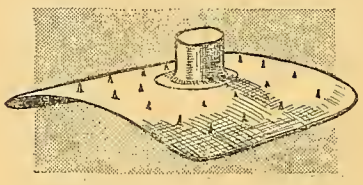


Lubrication of Auto-wheels.

The Vacuum Oil Company have issued a small pamphlet giving useful information on the lubrication of Auto-wheels. Users of these fitments would be assisted greatly by perusing one of these pamphlets.

Temporary Tyre Repairs.

The A.B.C. plug gaiter is a device which will form a very good temporary repair to a cover, at a low figure. It consists of a flat piece of rubber and canvas in the centre of which is a small rubber spigot; small spikes are also fitted, which prevent any strain being put on the spigot through creeping. The hole in the cover is cut out so as to form a tight fit over the spigot, and the gaiter is placed tightly inside the cover.

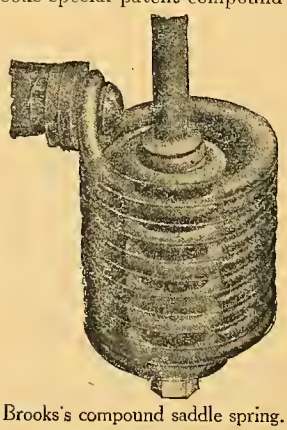


The A.B.C. tyre gaiter.

Vulcanising can then be performed, and the whole will hold for some considerable time. The gaiter can be obtained from the Pipe Motor Co., 173, Shaftesbury Avenue, W..

Comfort in Saddle Suspension.

Most riders agree that Brooks saddles are the last word in comfort and excellence of manufacture, and the main reason for the comfort provided is the use of the Brooks special patent compound spring



Brooks's compound saddle spring.

for the saddle suspension. It is a spring within a spring, and although most seasoned riders do not need to be reminded of its excellent qualities, yet newcomers to the pastime may well be advised to try its comfort-giving properties.

Recent B.S.A. Successes.

After the great success of the B.S.A. motor cycles in the Irish End-to-end Trial comes further evidence of the reliability in the shape of B.S.A. victories in the Sutton Coldfield and Streatham hill-climbs. In the Sutton competition K. Holden, with a B.S.A. and sidecar, was first on time and formula in Class VII. and did fastest time of the day for sidecars, and in the Streatham hill-climb M. C. Breeze secured three firsts and two seconds in the sidecar class. Again, on August Bank Holiday, at New Brighton track, G. W. Baker won the three miles championship of the north in 3m. 36⅘s. on a 3½ B.S.A.

Plantation Rubber for Tyres.

So many people are interested from the investment point of view in the use of plantation rubber for tyre making that it is interesting to note that the Dunlop Rubber Co., Ltd., are the largest users of plantation rubber in the British Empire. Contrary to the general impression, the use of this rubber in the production of tyres is no new thing, and its valuable properties have long since been demonstrated by ample road and track experience by the Dunlop Company.

The Enfield Two-speed Gear.

It may not be generally known that the Enfield gear can be obtained on several machines other than the Enfield. This gear was fitted to the Levis machines used in the T.T. and Calthorpe Cup Trial, to the winning Matchless in the Scottish Speed Championship, and to the Motosacoche on which F. W. Applebee won a gold medal in the A.C.U. Six Days Trial.

Catalogues Received.

Indian riders will find the catalogue of spare parts which has just been issued by the Hendee Manufacturing Co., Ltd., to be of great use to them.

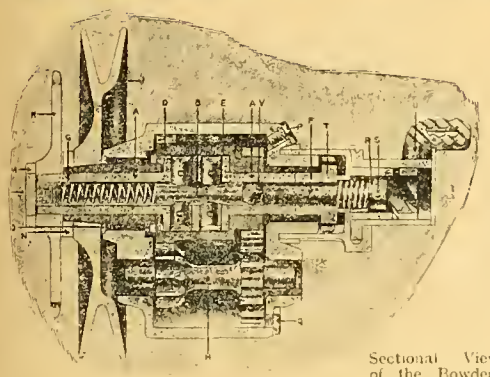
We are in receipt of the latest catalogue of Godiva sidecars, from the Godiva Sidecar Company, Limited, Conduit Works, Fleet Street, Coventry. Two models to which we would specially call our readers' attention are the C1, a particularly handsome attachment with a well upholstered body, and the model P, which is a racing model.

We have received a booklet concerning Broadmead motor car paints, varnishes, polishes, etc., issued by Hall's Auto Paint and Varnish Company, 175, Pancras Road, N.W. The book contains some interesting hints on renovating and touching up light cars and motor bicycles.

Dunkleys, Ltd., Jamaica Row, Birmingham, have forwarded us their latest catalogue of motor cycles and sidecars, and so well got up is it that we advise all prospective sidecarists to apply at once for a copy.

The latest edition of the Book of the 6 h.p. Royal Enfield Sidecar Combination has reached us, and a copy may be obtained from the Enfield Works, Redditch, free of charge, by any Enfield owner, to whom it should prove a veritable *vade mecum*. Every conceivable hint on how to obtain the best results from this well-known combination is to be found in the pages, which are profusely illustrated.

20 per cent Cheaper



Sectional View of the Bowden Two Speed Gear.

East Boldon, Co. Durham,
July 6th, 1914.

"I am pleased to say the Bowden 2-speed gear is perfect and the machine climbs with sidecar twice as well as before fitting. The kick starter is such an improvement. Wishing you every success with your gear.

(Signed) Vivian F. R. Clark.

OWING to improved manufacturing facilities the cost of production has been so reduced that we are now able to supply the standard

BOWDEN
Two Speed GEAR

at a cost of only £8-8-0

instead of £10 10 0. The cost of the models specially designed for Triumph, B.S.A., and Bradbury machines is reduced from £11 0 0 to £9 0 0.

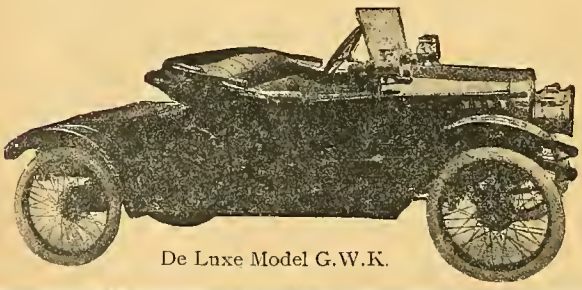
Taking it Easy



De Luxe Model G.W.K.

THE driver of a G.W.K. has an easy time: he just sits back comfortably and steers — and even that's easier than with most cars. He doesn't trouble about hills, however steep. Why should he? The G.W.K. friction drive gives him "a gear for every gradient," so he takes every hill with ease. Gear changing is simplicity itself. No "timing" is necessary — no "double clutching." He simply moves the gear lever and gets the gear he wants — gets it easily and silently. The G.W.K. driver doesn't worry about the "going," for, with its low centre of gravity, the G.W.K. always holds the road well — dry, wet, or rough. If the weather prove unkind, the hood can be raised in a second or two — a one man job — and the driver continues on his way completely protected, doing his 20, 25, or 30 miles an hour with clock-like — almost monotonous — regularity. Like to try the car yourself? A Postcard will fix up a trial run.

In answering these advertisements it is desirable to mention "The Motor Cycle."

"We lose the Good we oft might gain by fearing to attempt it."—*Shakespeare.*

Many motor cyclists—although they realise the great amount of time wasted when they require renewals or repairs to be done—hesitate before undertaking them themselves.

If they thoroughly realised that with a "Drummond" 4in. centre lathe, costing **£5 10 0**, they could turn, screw-cut, mill, drill, and bore, and that Drummonds will give them free instruction on any knotty point regarding the uses of their lathes—they would hesitate no longer, but start a small workshop with one of these unique lathes as a basis.

They would gain time, money, and an added knowledge of their machine.

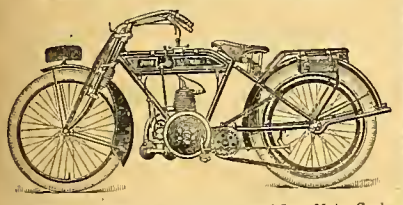
"JUNO" MOTOR CYCLES AND SIDECARS

ARE THE VERY BEST.



One of the many testimonials from riders of Juno Motor Cycles.

SILVER MEDAL AWARDED.

W. S. Capstick, Esq., 620, Manchester Road, Bradford, writes: 22nd July, 1914.

"I have been awarded a Silver Medal in the Bradford M.C.C. Speed Trial, on Blubberhouse Moor, Harrogate (Handicap) with JUNO 2-STROKE, with a speed of just over 38 miles per hour. The machine will really do more. I have got 49 out of it several times."

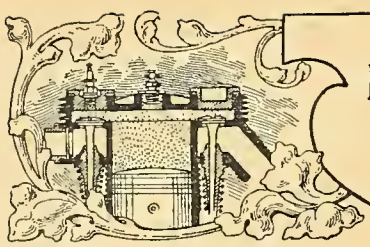
"Carry On."

THE simple and noble advice of the Chancellor of the Exchequer should be the watchword in every office and factory during this crisis. Every possible nerve should be strained to keep the trade flag flying, for the pennant of the merchantman is as vital to our life as the ensign of the battleship. No army or nation can fight or even exist on an empty stomach, and if there is any state into which the country may sink which would be more favourable than another to our foes it would be the state produced by vast bodies of artisans being cast out of employment for a prolonged period. Therefore it is necessary for each and every manufacturer to keep his doors open to the last possible instant, and not to rush to close through any sudden scare or panic. With the industry with which this journal is more intimately associated there should be no reason why work should not run on normal lines for some time to come, and, indeed, if affairs go well with us and our allies in the struggle there is no reason why the motor cycle industry should be seriously inconvenienced at all. Large Government orders have already been secured, and a great number of new machines have been snapped up by enthusiastic volunteers, and it is inevitable in the course of time that many of these machines will require replacing and many further new ones will be acquired. Surely, then, this is sufficient reason why manufacturers should build for stock. The trade has had two years of great prosperity and is in a better condition than ever before to shed a few immediate profits. It must also be remembered that when large numbers of new machines are wanted they will be wanted *immediately*. Any delays in delivery would be fatal. This is a vital reason why reasonably sized stocks might well be accumulated. Thanks to the efficiency of our Navy, the usual trade channels are open, so that the demand for motor cycles in the Colonies and Overseas Dominions should be sustained, and, indeed, we are bordering upon the period when the demand for Overseas mounts is most pronounced, and our great trade rivals ready to take advantage of it.

We hear of a number of important firms of motor cycle manufacturers who, having considered the crisis most carefully from every standpoint, have decided to keep on manufacturing steadily, having sufficient confidence in the quality of their products to know that sooner or later the demand for them will be brisk. After all, with the present shortage of horses due to the demands of the Army, power-propelled vehicles are bound to be pressed into service for a hundred and one different purposes. Business men, doctors, travellers, farmers, and veterinary surgeons are sure to take up the motor cycle in increasing numbers, and as regards the sidecar the field for this type of machine would appear to be even more pronounced. By the simple expedient of changing the type of body, business men have in the sidecar outfit a reliable low-priced vehicle costing little to run and able to perform hard work over scattered areas day in and day out. Even if petrol supplies did become scarce the owner of the business sidecar would suffer least on account of the economy in petrol consumption of these handy three-wheelers. Manufacturers who had not realised the new openings for their goods automatically brought about by war conditions should at once give attention to these subjects and other possible developments in order to cope with the demand.

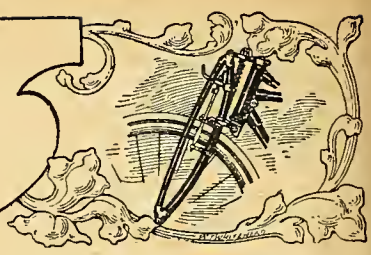
The country generally becomes calmer every day, and there is promise, and indeed a strong likelihood, that business will approach its normal scale in the near future. During war there must naturally be anxieties and difficulties for those engaged in international trade, but one feels that there has been a little too much nervousness displayed. The country, we are told, is full of food and full of money, and, therefore, we appeal to motor cycle manufacturers in general to assist in the prevention of unemployment, and remember that the welfare of the nation is governed by the welfare of the individual.



Hints for Beginners.

FIRST INSTALMENT:

The Arrival of the New Mount.

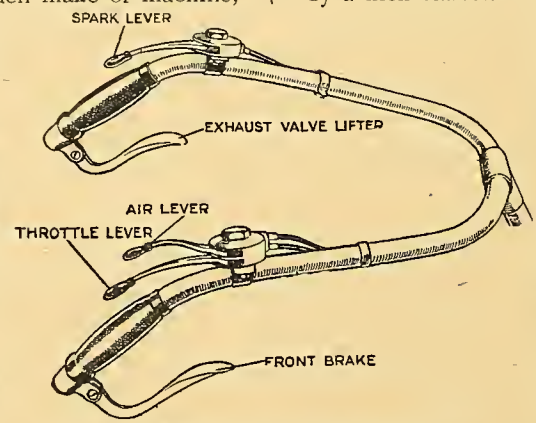


THE popularity of the motor cycle is increasing by such leaps and bounds that there must be nowadays hundreds of owners who have a very limited knowledge of the mechanical working of their machines. This is a high proof of the reliability of the modern motor cycle, but it is obvious that the owners could save themselves much trouble and considerable expense if they were in possession of a few elementary facts concerning the care and running of their mounts. It is for this class of owner, and for the prospective purchaser who is not imbued with mechanical knowledge, that the following notes are written, and the expert will find little to interest him unless some of the simple tips remind him of troubles in the days gone by. As it would be obviously impossible to give separate directions for each make of machine, it is necessary to generalise, and the advice given will be found suitable for most fairly modern machines.

The First Things to be Done.

The first thing to do on taking over a new machine is to study carefully the booklet which is usually supplied by the makers for any hints applying specially to that particular make to be found therein.

Before any attempt to start the engine is made, a thorough inspection should be carried out, and any loose nuts, bolts, etc., should be carefully tightened, but not over-screwed, as this may damage the threads.



A typical handle-bar showing usual position of controls.

See that the number-plates and any accessories are firmly fixed and will not vibrate or rattle and that the tyres are properly inflated. Test the riding position, and, if uncomfortable, make any slight alterations that are possible to ensure maximum comfort.

Now fill up the tanks, taking care that the drain tap is closed. Only a high-grade lubricant should be used. The bicycle parts should be lubricated, and, if the engine has not been previously run, two or three charges of oil should first be injected into the crank case and the pump refilled so that another charge may be injected slowly when the engine has been started. It is a good plan when dealing with a new engine to mix a full tablespoonful of oil with each gallon of petrol in the tank. This is apt to make the carburetter a little oily, but this does no harm and the mixture helps to lubricate the piston, which is often rather tight when new.

Starting the Engine.

Now test the throttle and air slides of the carburetter and see that they are working freely, and then set the throttle lever about a quarter open and the air closed. Advance the spark lever for about two-thirds of its range, and turn on the petrol and slightly flood the carburetter by pressing down the small knob on the float chamber. Then inject a few drops of paraffin or petrol into the cylinder. A fixed gear model must be placed on the stand, and the engine revolved by the pedals with the exhaust valve lifter raised. As soon as the engine is turning over freely the exhaust lift lever should be released and the engine should fire. If a gear be incorporated with the machine, the method is usually to place the lever in the high gear notch, depress the clutch pedal, and proceed as before except that it is not necessary to place the machine on the stand, and the pedals will probably be replaced by a kick starter. These remarks do not apply to all types of gear. If the engine will not fire, examine the plug points and high tension wire terminals, and see that they are clean and firmly attached. Then disconnect the lower end of the petrol pipe and see that the flow is quite free. It is quite likely that the engine will fire unevenly and emit black smoke from the silencer, in which case gradually open the air lever till these symptoms cease. Now take a seat on the machine and get accustomed to the feel of the controls (especially the brakes), but *never* race the engine running light, as this may quickly cause much damage.

If no clutch is fitted it is best to push the machine until it attains a fair speed and then release the exhaust lifter, taking care to be in such a position that it may be quickly raised again if the machine starts too fast. A machine with no clutch or pedals may sometimes be started on the stand by smartly pulling round the back wheel, but this is not advisable for the novice as it is easy to hurt one's hand on the mudguard.

Some Useful Driving Hints.

No amount of written instruction will teach an owner to drive perfectly, as it is a matter of "feel," confidence, and practice, but there are a few simple suggestions which may help to put the beginner on the right road. Keep your spark as far advanced as possible provided the engine does not knock. Give as much air as possible, provided the engine does not begin to run slower, misfire, or spit back through the carburetter. If the engine knocks on a hill slightly close the air lever, should knocking continue retard the spark lever. If the engine labours, change to a lower gear ratio.

Occasional Comments by "IXION"

The Latest Speed Dodge.

I was inspecting a rather special engine the other week when its owner offered to bet a small assembly of experts that none of them could guess the means by which its high rate of revolution was obtained. The secret—when he disclosed it—turned out to be aluminium alloy pistons in conjunction with phosphor bronze piston rings, and the cognoscenti were appropriately surprised. I wonder if many of our track experts have tried the dodge. It is, of course, common knowledge that many aviation engines have phosphor bronze rings, and I have heard it claimed that they generate less friction than the normal type, and do not gum up quite so badly. We may see them on standard touring engines yet.

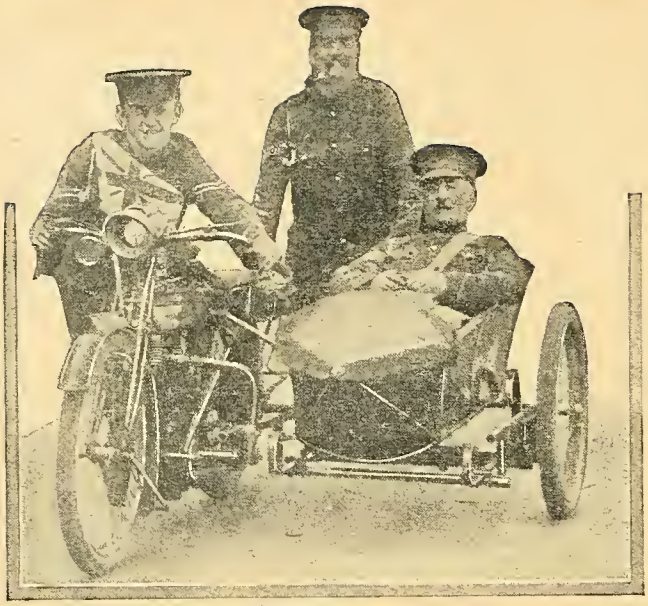
Electric Lighting.

One consequence of the standardisation of electric lighting dynamos (during the seasons of 1915 and 1916) will be a tremendous increase in night riding. At present, though motor cars are habitually used at night by the majority of owners, motor bicycles are comparatively seldom seen out after dark. The reasons are not wholly concerned with lighting problems; you can go to a ball or dinner or theatre very comfortably in a car, but the conventional costume is hardly suited to motor cycling. Then 50% of the cars on the road are driven by chauffeurs well practised in night driving; whereas, the average owner of both motor car and motor cycle has done little night work and is secretly rather nervous about it. However, lighting problems bulk very large in the contrast. Motor cycle generators are small, and can only give a steady and prolonged illumination in skilful hands. Motor cyclists have often little leisure and do not care to face the mess of cleaning a generator for the sake of a short evening spin. I found that the adoption of dissolved acetylene more than doubled the annual distance of my night riding, for it eliminated dirt and anxiety. I have no doubt that the standardisation of dynamo lighting will have a similar influence on thousands of riders within the next two years, and I hope the increased popularity of night work will react upon our warning and direction posts. It is already a simple matter to ride by night in familiar localities, but I find it very tricky work to tour in the dark, even if by "tour" I mean nothing more exacting than adding twenty or thirty miles to a day's spin which has carried me into unfamiliar districts. The road ahead requires much closer study; warning posts are practically invisible; a glance does not reveal the difference between a main road and a by-way at a fork ahead; signposts and milestones easily slip past unperceived; and the dazzle of the gas lamps in towns prevents one from sighting the direction boards fixed to buildings. One hopes that a huge influx of night riders would inspire the authorities to adorn all road direction posts and plates with green reflex mirrors or other helps to route-finding by night.

Detachable Wheels.

Long experience of mending punctures had made me rather contemptuous of detachable wheels on solo machines—their superiority on sidecar outfits is naturally obvious. However, the other week I modified my scorn a little. I was riding a machine thus equipped, and with characteristic hauteur I was about to mend the inevitable puncture with the wheel in the forks. At the last moment I decided to have the wheel out, wickedly hoping I might find something to criticise. Actually, there was a very marked increase

All motorists, except those with local numbers, are stopped at the Birmingham city boundary for identification purposes. In the photograph, a constable is seen examining the licence of a Matchless sidecar owner.



A Rover sidecar combination which is attached to the Warwickshire Yeomanry. It regularly carries three.

in comfort and convenience. I took the wheel to a comfortable bank of turf eight feet from the edge of the road, and dangled it on my knee in luxury. I bounced the wheel to shake off the accumulated grit, instead of laboriously mopping out the cover with a damp rag. When the tyre was back in the rim I bounced the wheel as a preventive of nips, instead of hurting my fingers by "rolling" the edge of the cover. Moreover, as the cover in question was brand new, of large section and incredibly stiff, I was very glad to have a decent chance to get three levers to work on it—a job that is awkward with a fixed wheel. Altogether, I returned home a determined convert, and full of the conviction that my 1915 utility hack must have detachable wheels at any cost.

Notched Ringed Pipe Unions.

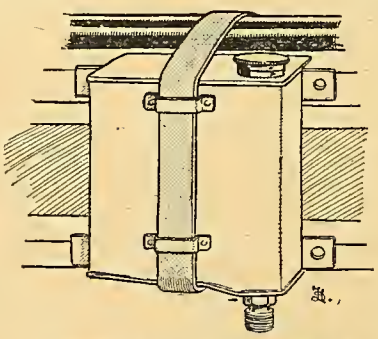
It would be interesting to hear a practical engineer's defence of the notched ring pipe unions so dear to some designers. For my own part I have conceived an inveterate prejudice against them. I never liked them on exhaust pipes, where they most frequently occur; the tiny hook prong on the C-ended removing tool always snaps off as soon as the heat and rust have tightened the threads up, and, until it snaps, you have to change the bolt about a dozen times to shift the union. After it has snapped, you rejoice that your conscience is temporarily free to knock the abomination loose with a punch and a hammer; until the punch removes all edge from the notches, and then you fall to cursing and buy the biggest pair of gas pliers imaginable! Joking apart, a hexagonal union on which a wrench can exert even pressure all the way round is surely more convenient and mechanical. When I get a double union of this type on the inlet pipe of a twin, supplemented by a spanner which does not fit it, I dissolve into tears.

Twin-cylinder inlet unions certainly take a bit of designing. It is difficult to get a pair of big hexagonal nuts to register with dead truth. The split pipe with a crampbolt is easy to handle, provided you can slide the carburetter stub sufficiently far along it to stop air leaks; and this is awkward, because you cannot clump any part of a carburetter with a mallet. Give me for preference the two-nut flange fitting as employed on the 1914 Douglas.

Petrol Consumption Trials.

A Suggestion for the More Effective Holding of Club Tests.

FOR some time it has been felt that the split second and secret check method of finding a winner in reliability competitions left much to be desired and robbed such events of much of their enjoyment, hence many excellent means have been devised to differentiate between the performances of those who have made non-stop runs, such as flexibility and acceleration tests, stopping and starting on hills, brake tests, etc., and, were it not for the difficulty of measuring the spirit correctly, petrol consumption might well be regarded as a final test of efficiency. It is, however, by no means easy to measure the petrol in an ordinary motor bicycle or cycle car tank with the instruments usually at hand; inequality of the ground, the expansion of the spirit over a hot engine, and other varying factors may all account for small inaccuracies which may well affect the result considerably.



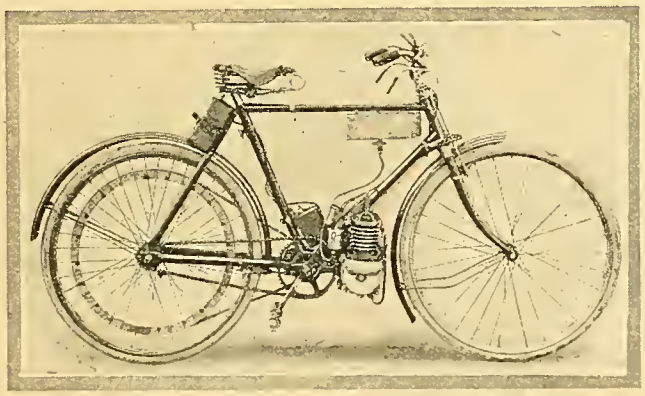
A suggested form of petrol container suitable for attachment to existing motor bicycles, or, by means of screws, to the dashboard of cycle cars.

In view of these difficulties we suggest that the A.C.U. should acquire a moderate number of small supplementary tanks holding, say, a quart of spirit. These could be made quite cheaply, and should be so designed that they could easily be fixed temporarily to motor cycles and cycle cars, and should slope at the base in such a way as to ensure that the last drop of spirit should find its way into the carburetter, preferably through a flexible tube. The A.C.U. could then hire the tanks out to clubs for their competitions. We believe that many clubs which could not afford to purchase a supply would gladly hire these tanks. Elaborate finish and fittings would be quite unnecessary: if a bracket shaped like an inverted L were attached to one side to keep them from slipping down, the tins could be strapped to the side of the petrol tank, a piece of felt having been placed between to prevent scratching. The competitors' machines could then be run to a standstill, and the results calculated on the A.C.U. consumption formula.

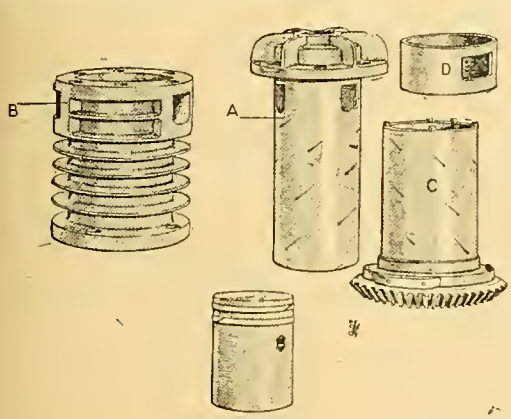
A Miniature Rotary Valve Engine.

An Unusual Design for a Lightweight.

ALTHOUGH the rotary valve has received a certain amount of attention from car manufacturers, it is seldom that any attempt has been made to adapt it to an air-cooled motor cycle. The advantages of silence and positive action are usually considered to be annulled by the difficulty of lubrication and complexity of operation. Thus it is particularly interesting to examine the design of Mr. Tooth, of Humber Road, Coventry, which the inventor has produced with the idea of obtaining the advantages without the drawbacks.



A motor-assisted bicycle, fitted with a rotary valve engine



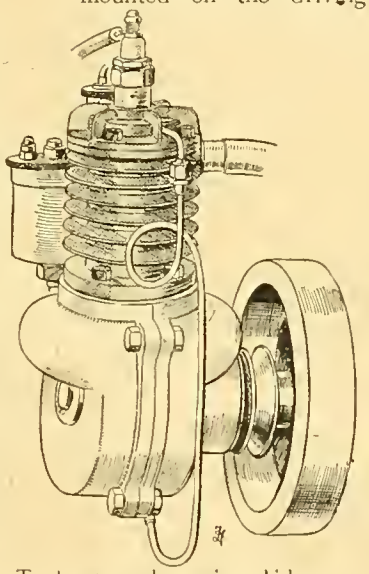
The engine, showing valve gear mechanism and cylinder. The lettering is referred to in the description.

A "Teacup" Engine.

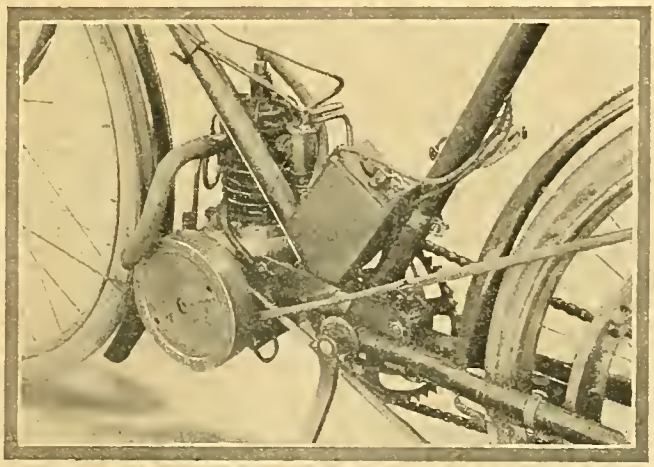
The first engine in its experimental form is a genuine lightweight and is attached to an ordinary pedal cycle by two flat clamps holding the down tubes close to the bottom bracket. The tiny engine has a bore of 38 mm. and stroke of 44.5 mm., giving a cubic capacity of 50.5 c.c., and its construction is most interesting. The cylinder proper A, in which the piston reciprocates, is carried by a flange joint at the head, which is bolted to the outer casing B, which, in its turn, is fixed to the crank case in the usual manner. Between these two members lies the driving sleeve C, which carries on its lower face a bevel driven by a half-sized bevel on the crankshaft. The rotary motion of the sleeve is conveyed to the valve ring D by means of dowel pegs shown on the upper face of C. These engage with corresponding holes in the valve ring, and an odd peg prevents the ring being mounted incorrectly. The crankshaft is built up and runs on plain bearings throughout, and an outside flywheel is mounted on the driving end of the shaft.

Lubrication is by splash, but a by-pass leads from the base chamber to the valve sleeve and thus keeps it thoroughly lubricated, while both the cylinder and driving sleeve have a series of holes and grooves which assist in distributing the oil over the moving surfaces.

The valve ring is quite plain, and has a single port which registers in turn with both the inlet and exhaust ports, which are formed in the cylinder and outer casing and set at 90° to one another.



Tooth rotary valve engine, which, as will be seen, has an outside flywheel.

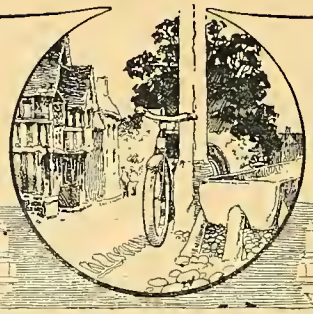


The tiny engine, showing the method of fixing it in the frame.

At the present time coil and dry battery ignition is utilised, a segment being mounted on the base of the driving sleeve and making contact with a variable point on the crank case.

On the experimental machine the drive is through a round belt, which is crossed so as to give a good friction surface on the small front pulley. On test no trouble has been found with the lubrication, and we have seen the little motor running very steadily.

Scott, Morgan, and F.N. in Ireland.



Being the Adventures of Three Tourists.

THERE were three of us. After a prolonged discussion of a suitable place for spending our annual week's holiday, we ultimately decided to try Ireland.

Accordingly, on a certain fine night in July we assembled on board the boat at Fishguard, whence we were bound for Rosslare. Since our last year's trip one of us had rung down the curtain on his youth, and, eschewing two wheels, was now the proud possessor of a Morgan runabout; the other still had his Scott, while I was again pinning my faith to my old four-cylinder F.N.

Having arrived at Rosslare the following morning, we did not hurry off the boat, but first had a comfortable breakfast and about 8.30 took train for Wexford, there being no proper road from Rosslare.

Wexford to Dungarvan.

At Wexford we secured petrol at the station, and then took our machines to a garage to have a few jobs done, while we had an early lunch.

Our destination that day was Cork, *via* New Ross and Waterford. We soon had a taste of Irish roads, and the jolting proved too much for the Morgan's chains, which, no doubt by way of protest at being too slack, jumped off. It was, however, quite a pretty run at the start by the side of the water. A steep descent took us into New Ross, but there is nothing much that calls for comment till Waterford is reached. There we left the Morgan to have its chains repaired while we refreshed our inner man with tea before continuing on our way to Dungarvan. After Waterford there are some stretches of good road followed by very bad parts, and we sped and bumped along amid pastoral scenery with pretty views of the surrounding hills. Arrived at Dungarvan we halted on the bridge crossing the river, and on re-starting the driver of the Morgan, trying to show off before the admiring crowd collected round my F.N., dashed in his clutch with a bang, and thereby sheared all the bolts off his chain wheel! We tried to look as if we had no connection with him, but he had our luggage and it meant staying the night in Dungarvan.

Dungarvan to Cork.

On the morrow we were gratified to find that the local garage had made an excellent repair of the Morgan. The job had taken till 4 a.m., so the mechanic informed us. We were indeed fortunate in finding so self-sacrificing an artificer. Glengarriff was our ultimate aim, and ten o'clock saw us *en route* for Cork. A good but dusty road with a long ascent, with a fine view of the Knockmealdown Hills, and we arrived at Youghal. After that town, however, there is not much to note till Cork is reached. Here we lunched. The country is pretty and pastoral between Cork and Macroom, and for the first ten miles or so the road is a good one.

Tyre Troubles and an Accident.

In Macroom we replenished our tanks and had but just started when the cycle car front tyre burst. There was a nasty hole in the cover, but we patched it up temporarily, and on a winding road in the midst of lovely wild moorland scenery we ambled on through Inchegeelah. About four miles beyond we were in "trouble." There are some exceedingly tricky corners, and round one of these the Scott, which was leading, met a priestly cyclist and his brother riding abreast on the wrong side of the road. The brother's head tried conclusions with that of the driver of the Scott, met him well beneath the chin, knocked him backwards off his machine, and then collapsed on top of him.

We can joke about it now, but at the time, when we came up we received a horrible fright, and it was serious enough in all conscience. There lay the two machines, their front wheels absolutely interlocked, while stretched beside the roadway was a prostrate form with our companion, a nasty gash on his cheek, and a priest bending over it. We procured water from a little cottage close by, a sponge was produced, and it was our companion, full of theory, who administered first aid to his unconscious victim. Eventually we put our patient into the Morgan and the driver conveyed him slowly back to the hotel at Inchegeelah, while our victim (whose machine had miraculously escaped vital injury, though badly battered), the priest and I followed them up. The Morgan was certainly "having its day," for after putting our patient on to a couch, our companion rushed off in it to fetch a doctor. The doctor was out, but was tracked down out in the wilds, some ten miles from Inchegeelah, at the house of the parish priest, and borne triumphantly back. The patient's injuries proved more sanguinary than serious—slight concussion, a beautiful black eye, and a severe shaking.

The incident closed with a particularly pleasant dinner in the company of the priest and the doctor. Several knotty Irish problems were settled that evening, and dawn was all but due when we reluctantly saw our friend the doctor, who had proved to be the very best of fellows, off home on a bicycle and retired to bed.

Our victim of the accident of the day before in the morning asserted that his jaw had been broken and his neck dislocated; moreover, owing to facial disfigurement, he was forced to grow a beard. The other

complained of a bit of a "head," due as he put it to the "spiritual" strain of upholding the honour of England the previous evening. Things pointed decidedly to a quiet day, so we lounged about Inchegeelah, which is a pretty little village, till the doctor turned up. He found both his patients "doing well," and after paying a visit with him to the "local dispensary," we bade good-bye to our many friends of misfortune, and were soon once more gingerly negotiating the corner of yesterday's *contretemps* on the road to Glengarriff.

Beautiful Scenery.

The lakes which break upon your gaze soon after leaving Inchegeelah are wondrously peaceful and beautiful, and contrast strongly with the rugged grandeur of the Keamaneigh Pass. Before ascending the Pass which winds away before you, take the road to the right that leads to Gonganebarra. There, full of folk lore and tradition, surrounded by mountains, lies a wild and sombre lake, whose dark waters encircle St. Finbar's sacred Isle. Then, returning, continue up the narrow winding way of the Pass which, with the turbulent rocks on either side, becomes even wilder as you ascend. The gradient is by no means steep, but there are many tortuous turnings, and the surface of the road is very loose. But who would wish to scorch through such scenery as this? We certainly should not. On descending, the road improves, but the dust was stifling. Just at the foot of the Pass there is a fine old ruin, Carriganess Castle, by the side of a tumultuous stream; later one has many a fine view of Bantry Bay and Glengarriff Harbour with their surrounding mountains. With many a halt to gaze upon the glorious panorama we continued our way on a road winding up and down, till a somewhat steep descent brought us into Glengarriff. We had put to our credit only twenty-eight miles, but we had found our way to the very heart of the scenery. After a somewhat late lunch we strolled down to the bay for a bathe.

Boating and Bathing.

Surely Glengarriff Harbour must be one of the most beautiful spots in the world. Surrounded as it is by mountains, with its many verdant islands fringed with yellow seaweed and capped with the bright green foliage of the trees and with its lovely little bays and creeks, it has a certain unique beauty all its own.

We hired a boat, and Pat Murphy (our boatman) took us to a beautiful sunny isle, from which, hot and dusty, we dived into the cool clear waters of the bay. A glorious bathe in one of Nature's most heavenly gifts. Afterwards, as we basked in the sun and smoked our pipes in contemplation, we vowed we must return to Glengarriff.

Tyre Repairs.

The Morgan's front tyre had upset its owner's nerves, and he was up soon after six o'clock next morning to do a little patching.

We two strolled down to the bay for a dip, and then, in order to chasten his spirit, we went on to the garage to tell our hard-working companion of its delights.

By the aid of a thick piece of saddle leather under the hole in the outer cover, a strap bound tightly over the outside, he had effected a rather neat repair. We congratulated him and took him into breakfast.

It was nearly noon before we were on our way to Killarney, dodging donkeys as we ascended a somewhat loose road to the tunnel at the top of the Pass, a rise of about a thousand feet. Ah! but what grand sights you will see across Glengarriff Harbour and Bantry Bay beyond! Stop and enjoy them to the full.

The Morgan on board the boat at Cork.

In Glengarriff Bay.

The little village of Sneam

It was hereabouts that my companion on the Scott snapped the Morgan "*at speed*," giving it, as he sarcastically remarked, a "time exposure." It is a fine run down to Kenmare with a straight stretch toward the end, where, if you have a mind to it, you can do some speed work. About a mile this side of Kenmare the Morgan punctured its other front tyre. As the driver was carrying our luggage we decided to wait and *listen* to him mending it.

After a good lunch at Kenmare, we then made a clean ascent to Windy Gap (the road is somewhat loose, but for a single track machine it serves), where a typical old Irish dame insisted on being recompensed with a shilling, because, forsooth, we had taken her photograph.

Instead of bearing off to the right after Windy Gap, we kept straight on, and had gone about five miles on the road to Sneam ere we discovered our error. We retraced our steps, or rather our revolutions, until the Morgan's damaged tyre gave way, resulting in a few idiomatic phrases and necessitating a new inner tube. It is these little breaks that give to us onlookers time

for the peaceful pipe and opportunity to realise fully the beauties of Nature.

And this puncture, with the Kerry Hills all around us, was particularly pleasant for us two soloists.

A Close Shave.

"One close shave necessitates another." Our friend's beard had made considerable progress since his accident, and he decided next morning to have a close shave of another, though equally painful, kind.

Lough Leane had seen fit to shroud somewhat her loveliness beneath a heavy haze. Moreover, we were informed that the boatmen were out on strike; this compelled us, instead of our intended row on the lake, to be content with a stroll about its lovely margin.

We then went on into the town. Killarney itself is by no means beautiful. We spent a very pleasant hour or so in the garage, where the cycle car received the full benefit of two new covers. The Scott meanwhile also underwent some minor repairs rendered necessary by its fall.

"Billiard Table" Roads.

Having nothing to do myself, I made suitable remarks on the subject of reliability. We really had a very pleasant time. Back we went to our hotel for lunch, and about two o'clock left Killarney for Waterville. The road had been described to us by the hotel porter as being "like a billiard table." Evidently his ideas of billiard tables were based on the condition of the one on which we had disported ourselves the previous evening. Anyhow, I have seldom been on a more unpleasant road. Later, however, the surface improved, and we had a splendid spin on the side of the hills with fine varied views of the cloud-capped mountains of the Dingle Peninsula on the other side of the water. Scudding through Cahirciveen, a somewhat dirty town full of carts and cattle, we halted just opposite Valentia Island. Hereabouts our companion, in an attempt to oil the Scott's chains, threw it down on the ground and jumped on it. We disentangled and smoothed it out, and resumed our journey. Possibly as a result of this gratuitous "turn," but more probably in consequence of his morning's work on his Scott having doubled its petrol consumption, he next ran out of petrol. We of our plenty gave to him in his need, and on a dusty and somewhat tame road, we so ran that we entered Waterville.

The Usual Champion Fisherman.

Having hitched up ourselves and our machines at an hotel we took a boat on Lough Currane. Our boatman had, of course, caught the largest salmon ever taken in the lake. What boatman worth his salt has not? Yes, Waterville is a charming centre and Lough Currane is grand, but I believe there were hosts of other beauty spots we should have seen.

We arose on the morrow soon after six o'clock. Again the long-suffering Scott was subjected to its matutinal molestations. The only really necessary job, a leaking back tyre on the Scott, was chanced, and, as a consequence, after we had gone about a mile on our way, off it had to come. Our programme was to work our way back to Glengarriff, *via* Parknasilla and Kenmare, and it was about nine o'clock when we left Waterville. The road had been described to us as the best in the south. Cut out of the side of the hills, sloping down to the sea, it follows the coast closely all the way, winding up and down, with grand views of the mountains across the estuary. We plied peacefully along until we espied beneath us a beautiful little bay. Heart could desire nothing better than a bathe in its blue sparkling waters. So leaving our machines by the roadside, we clambered down the rocks on to the beach below, and casting convention aside with our clothes, plunged into the water's pellucid depths.

An Interrupted Bathe.

And afterwards, how sweet our pipes tasted as we basked in the sun of that little secluded cove, with the dark rocks sheltering the cerulean waters, while around us on the silvery sand black cattle lay, drowsily brooding. What did it matter that one of the cows turned out to be a bull, which, evidently annoyed at one of our companion's red head, roused itself from its slumber and came bellowing towards us. We decided nevertheless that we must be moving, so hastily donning the habiliments of civilisation, we climbed back to our machines. Truly it had been worth while.

Speeding on, our way took us through a broad and beautiful valley, the skyline of which was broken by rugged peaks, with here and there a pretty white thatched cottage, and all the time away to our right the sunlit estuary and hills beyond. A gentle slope brought us into Sneam, a little village that seems to associate itself more closely with the ideal Irish village. Parknasilla was our next halt, and there we lunched, while afterwards we sat with eyes fixed on one of the most vivid pieces of colouring, the almost purple haze on the mountains, beyond the bright blue water of the island dotted estuary—an earthly Paradise.

The Last View of Glengarriff.

Once more on the road, we passed through Kenmare, and again over the Pass into Glengarriff. The wind was blowing lustily as we ascended to the tunnel, and it was all we could do to keep our machines to the road. On restarting, after a brief rest at the top once again to admire that noble view of Glengarriff Harbour, my hat blew into the valley below. I waved to the driver of the Morgan, who was behind, to stop his machine and climb down for it, but he affected not to understand my signs, and I had to fetch it myself. He is no gentleman, as I told him. It would not have taken him more than twenty minutes to get it.

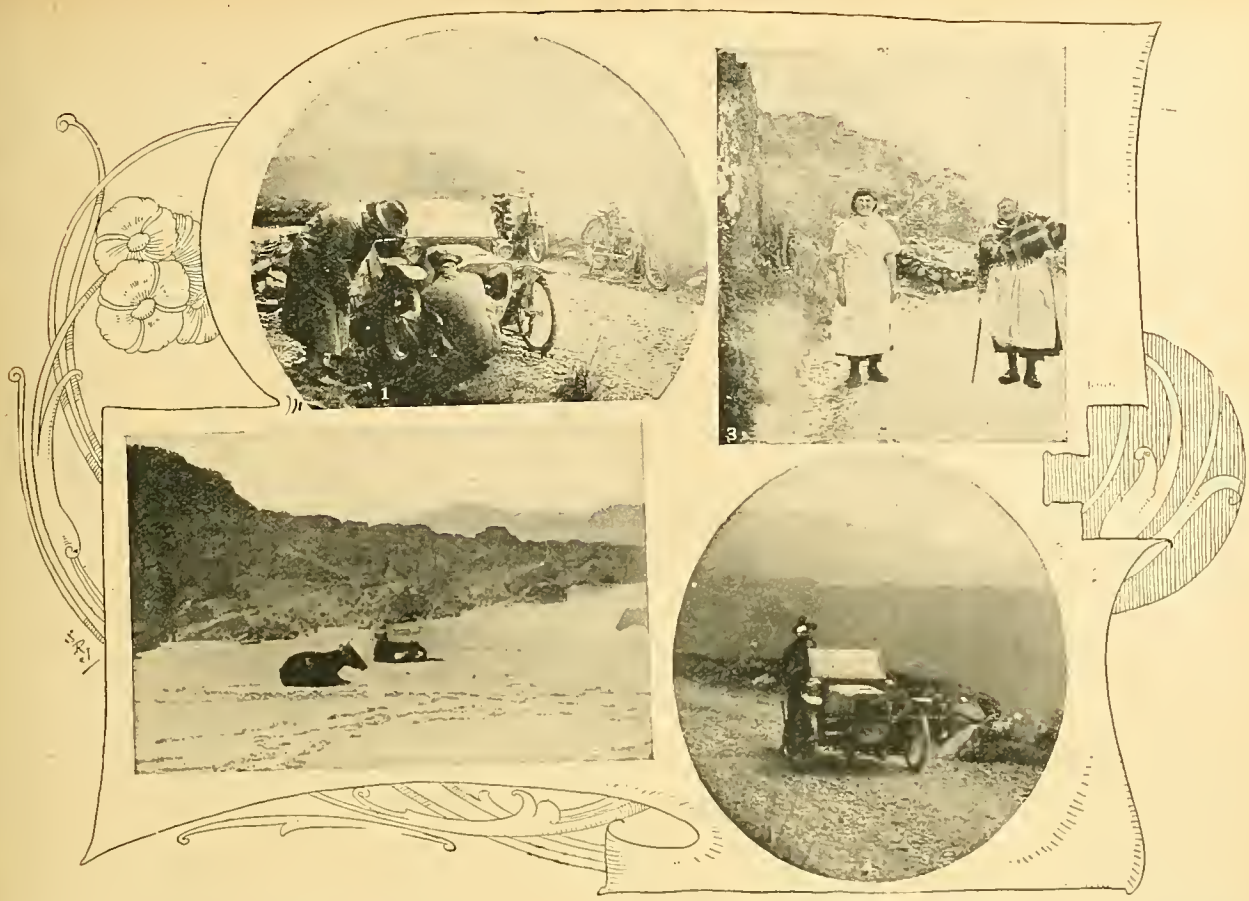
Having arrived at Glengarriff, we went down to the bay, where our old friend Pat Murphy rowed us to the best place for a bathe, and begorrah! he found a cold one.

We then had tea. I never hope to have a better day.

Friday, ever unlucky, was to be our last day, for we had decided to take the boat direct from Cork to Fishguard rather than go all the way by road to Rosslare.

After a last look at Glengarriff Harbour we set off soon after breakfast on our way. The account I shall give you of our last day may sound a little colourless I admit, but I tell you beforehand we had a good deal of fun all the same.

We took the coast road to Cork through Bantry, Skibbereen, Leap, Clonakilty, and Bandon, but I do not think we should go that way again. The road, though for the most part wide, in places had the bare



(1) Trouble with a tyre.
(2) The little bay near Waterville.
(3) "Windy Gap."
(4) The Morgan at speed on the road between Glengarriff and Killarney—according to the writer, a time exposure! Note the extremely bad road surface.

rock standing right out of the road. There are one or two pretty bits of scenery, but we had been spoiled by the splendid seascapes of the West, and as a matter of fact we only caught a glimpse of the sea here and there.

Just out of Bantry there is a somewhat steep hill with a nasty turn. We were warned against it, but all of us found no difficulty in making clean ascents.

The Scott scored a puncture, the F.N. broke a mudguard stay (the other two insist on my mentioning this) at Bandon; we lunched off fish, it being Friday, and then about ten miles this side of Cork the Morgan broke its high gear chain and trickled tamely into that city on low gear—a very ignoble finish. We had none too much time to spare, so we sent on ahead our friend on the Scott to procure our tickets for the steamer, and we then took our machines straight on board. And there from the deck, our minds replete with happy memories of wonderful scenery, we watched the coast of Ireland slowly sinking away into the dusk of evening.

Generally speaking, the roads we traversed, except where the Road Board had been at work, were either very bumpy or very loose, and almost invariably dusty. They are, moreover, for the most part particularly unsuited for a three-wheeler. A car or bicycle can usually find a track, but the progress of the Morgan where the road consisted of two deep tracks resembled that of a crab. I would state here that, on the whole, the little Morgan did marvellously.

There were no really steep gradients, but there are many sharp and dangerous corners, while the innumerable stray donkeys and cattle, and the fact that the average Irishman is none too particular as to the rules of the road, necessitate caution.

What a wealth of wonderful country is contained in this Emerald Isle of ours! It is as though Nature had made the West her boudoir, there to store all her most cherished treasures. And whether it be a wild mountain pass or peaceful vale, wooded lake or rugged seascape, there is something about it, something in the air or colouring, I know not what it is, something that is all Irish, and different from any other place.

And what of the people, the bronzed and kindly peasants and the bonny shawl-clad lasses who wave to you as you pass?

We three have taken many tours together, but never a more enjoyable than the week's sojourn of some four hundred miles—a week of uninterrupted sunshine amid the glories of Erin's Isle.

> "And not by eastern windows only
> When daylight comes, comes in the light;
> In front the sun climbs slow, how slowly!
> But westward, look, the land is bright!"

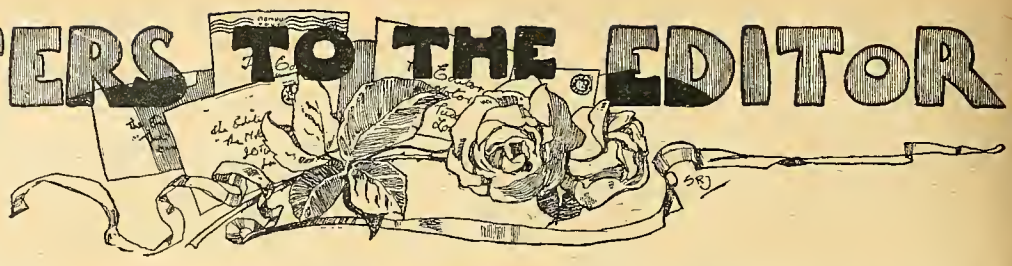
C.N.D.

LETTERS TO THE EDITOR



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Relation Between Horse Power and Capacity.

Sir,—I was always under the impression that there was a certain defined relation of h.p. to c.c. But after looking down the excellent list of lightweights in your issue of July 23rd I feel that I should like your assistance in untwisting what seems to me to be a veritable tangle. In comparing a few specifications, I began to group them as under :

NAME.	h.p.	c.c.
James	2¼	226
Coventry Eagle	2½	269
Elswick	2	269
Gerrard	2½	269
Levis	2½	293
Singer	2½	299
Omega	3	344
Peco	2¾	349
Regina	2¾	292
Alp	2	257
Calthorpe	2	170

These are just a few picked out at random, and they cannot all be correct, surely. ENQUIRER.

[Our correspondent is quite correct. There is a definite relation between c.c. and h.p Makers' nominal h.p. figures are only approximate. A modern engine should give 1 h.p. for every 100 c.c. ; thus a 500 c.c. engine gives 5 h.p., and so on.—ED.]

In most districts motorists are being stopped and asked to produce their licences. Cars are being examined. Above is a scene near Great Yarmouth.

A Useful Tip.

Sir,—Perhaps the following tip for brightening the lower part of a cylinder may interest readers of *The Motor Cycle*. First of all take about four feet of Manila rope, unlay the strands, and draw out three yarns from one of these, then plait these yarns tightly in the ordinary way. Hammer this out flat, or nearly so, with a wooden mallet. Saturate it with ordinary thin oil which contains some powdered bath brick and wrap it once round the cylinder. Now grip an end of the rope in each hand and work the hands in and out alternately. A few minutes' work will brighten the cylinder and a rub each night with oil alone on the rope will keep it bright. JOHN W. WALKER.

A Dangerous Practice.

Sir,—A few weeks ago I was driving along a main road in London when a wretched little urchin threw a stick at me, or rather at my machine. Having got used to the practice amongst boys of throwing any kind of article at passing motor cyclists, I did not pay much attention to the occurrence at the time. However, soon after, the machine started running very badly as if labouring up a steep hill. Being rather a novice at the sport I could not trace the trouble and decided to continue my journey. I managed to get home, not without difficulty, and imagine my surprise when I found a stick 2ft. long and ¾in. thick lodged between brake and tyre of the front wheel. It was completely hidden from view by the mudguard. Of course the tyre was completely spoilt, the rubber having worn away in places right on to the canvas as the result of the friction between stick and tyre.

I wish something could be done to stop this nuisance on the road and to make children realise the danger attaching to this practice. Would you, sir, have expected to get compensation from the insurance company in such a case? I had not much hope when I wrote to the Provident Clerks' Insurance Company and put the case before them. However, I had a letter saying that, although this kind of accident did not really come under their policy, they would pay the expense of a new tyre. This was, indeed, a pleasant surprise, and I mention it because I think such splendid treatment deserves commendation. H. A. MADSEN.

The Overseas Market.

Sir,—Kindly permit me a few lines in your valuable paper. I have just read your article of May 7th on the overseas market. I hope, in reading your remarks, the manufacturers will not think it necessary to pile on weight in order to gain strength. A light machine of reasonable strength can be taken over roads where it is impossible to go with a heavier mount. Speaking for myself, I have not much fault to find with the average machine, but I do think that less nickel plating would be an improvement. Where the makers can help us most is to fix a reasonable price on their machines to suit the different countries. Why cannot a machine be sold here at the English price plus duty, freight, etc.? The agent here must get the same profit as the English agent, and yet he puts on another thirteen or fourteen pounds. The excuse about having to support competitions is very poor, as all the competitions held here in a year would hardly make enough reading matter to fill one copy of your paper. As to the stock agents hold, I am afraid they are very small. I have been waiting about a month for a pair of foot rubbers. I could not even get a filler cap for petrol tank. I had one

W D

The War Office are purchasing both for actual service and for purposes of home defence, in the case of twin motor cycles, only those machines which have horizontally opposed cylinders, such as the Douglas. Ponder what this means when SPEED, RELIABILITY, ENDURANCE, SILENCE, and FLEXIBILITY ARE MATTERS OF LIFE AND DEATH, not only to the actual rider but may be to large bodies of troops, as in warfare, especially in the case of a surprise attack; success depends almost entirely upon the prompt and certain delivery of dispatches. This decision of the War Office experts confirms the countless successes achieved on

Douglas

MOTOR CYCLES

in every conceivable test, a few of the principal of which are given below. The Douglas was the pioneer of horizontally opposed twin-cylindered engines, therefore, let your mount be a Douglas, and so reap the advantages accruing to the greater experience.

made at a cost of 6s. I consider there is a good opening here for a good accessory dealer. There are hundreds of articles on the English market which never reach us. I am afraid I am repeating an old cry, but I have noticed that the efficiency of the present day machine is due to repeated efforts made by your paper to improve matters, and I hope in time that it will be the means of assisting oversea readers to obtain all they need at a reasonable price.

Wellington, New Zealand. E.G.M.

Possible Scarcity of Motor Tyres.

Sir,—In the present unsettled state of affairs, it behoves all motorists to use their tyres with the greatest care possible. Most of the great foreign tyre factories must be entirely stopped, or their output reduced to a minimum. Thus if tyres are used quickly an inevitable shortage must follow, and an effort might be made by manipulators to raise prices. We therefore beg motorists to use special care with their tyres, in order to make them last as long as possible, as it is quite conceivable that a period of shortage may arise as soon as the present stocks are consumed, but if everybody will help there is no reason why the home manufacturers should not be able to meet the demand, as under the present condition of affairs the consumption must undoubtedly decrease enormously.

DAVID MOSELEY AND SONS, LTD.

"Ixion's" Tip for Fitting Valve Springs.

Sir,—I was very pleased to read that the versatile "Ixion" has at last had the decency to try one of his own "tips."

It is a pity "Ixion" abandoned the contest at such an early stage, as he had by no means reached the most exhilarating part of the proceedings. I claim to be the first and only man who has succeeded in fitting a valve spring by the means suggested, namely, by first tying the spring together with string. It is true that the operation involved a black eye and the loss of two finger nails under very tragic circumstances. It is also true that I had forthwith to remove the spring for the purpose of disentangling the string. The fact remains, however, that I carried the adventure through to its very bitter end, and am, therefore, better qualified to write on the subject than "Ixion," who appears to have been knocked out in the first round.

It is "tips" like this that make us Britons what we are.

This "tip" breaks out once a year in company with the well-known wheeze for smashing piston rings with strips of tin and removing the belt pulley with a garden fork.

If "Ixion" is about to start a tip testing campaign he might like to try the following method of shortening the Dunlop belt. It is quite easy, and I make no charge for it. You simply lop off the end and it's done. Help!

JOHN KENNEDY, JUNIOR.

An Unusual Fault.

Sir,—I have had a peculiar trouble with a well-known two-stroke motor cycle I have been riding lately which might interest your readers.

On practically every journey the engine would misfire badly and then stop. Retiming the magneto or altering the adjustment of the contact breaker enabled me to get going for some time, when either of these operations had to be repeated. I fitted a new chain (the one supplied being very faulty), but no improvement resulted. I then had the magneto tested and found correct. The shaft was also trued in a lathe and a fresh bush fitted. Both sprockets were running exactly in line. As a last resource I tested the holes in the sprockets and found both of them had been drilled eccentric. It speaks well for the magneto that it has stood the severe bucketing for over 1,000 miles without serious damage.

Incidentally, I have had more roadside tinkering in that 1,000 miles than in my previous mileage of over 30,000 with the four-stroke 3½ h.p., but the two-stroke is a wonderful engine for climbing and power.

The two-stroke manufacturers glibly tell us how many working parts they eliminate as compared with the four-stroke, but, considering the price asked for some of their machines, the attention paid to detail and finish is very poor indeed. FRANK COMER.

British Magnetos.

Sir,—I note with interest your article on the English magneto, and should like to know if the two or three machines you mention are really English made throughout or partly only. I should also be glad to know if the ball bearings are actually made here or imported from Germany, and whether the condenser mica is selected and split in this country or imported from India, trans-shipped in bulk to Germany, and re-imported ready for sale.

Are the tinfoil, fibre, varnished paper, insulating silk, vulcanite, slip ring, carbon brushes, and carbon brush holder made in this country?

Is the copper wire drawn and enamelled in England? Are the end plates and other die-cast parts manufactured by English people? The origin of raw material is not important. Unless every part is made in England an article cannot be called "Made in England." STABILIT.

We submitted a copy of the above letter to the British Thomson-Houston Co., Ltd., whose reply is appended:

To the Editor, *The Motor Cycle*.

Sir,—We are very interested in the letter you were good enough to send us, signed "Stabilit," and are pleased to be able to assure the writer that all the parts covered by his letter are of English manufacture exclusively. Material such as mica must of necessity be obtained from India, this being split in our own factory.

We should be interested to learn if the writer of the letter is in any way connected with the German company supplying insulating material known as Stabilit

THE BRITISH THOMSON-HOUSTON CO., LTD.

Rear Lights.

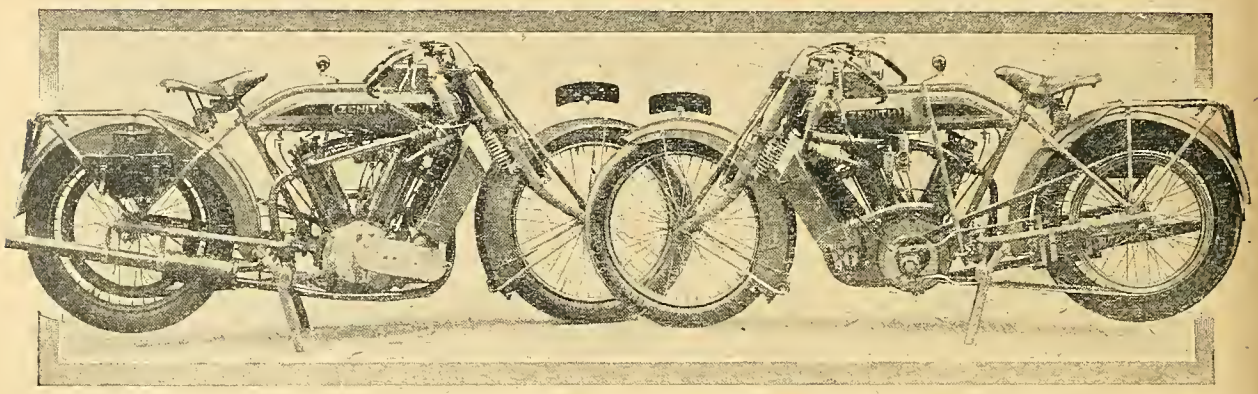
Sir,—I should like to congratulate you on publishing the letter of Lieutenant R. T. Gould, which Mr. Bennett and many other motor cyclists would do well to mark, learn, and inwardly digest

The extraordinary letter of Mr. Arthur G. Ellershaw is certainly well headed "Defective Head Lights." Mr. Ellershaw's letter is presumably in advocacy of the reflex light, but he was evidently himself driving with defective head lights if he and his passenger only faintly saw a red light "three yards away." Furthermore, if Mr. Ellershaw really was "going at fifteen miles per hour," and the cyclist was riding at, say, ten miles per hour, his rate of approach would be only five miles per hour, and any danger of collision must have been infinitesimal. Is it not rather more than likely that the "steep gradient over a railway" was the real cause of Mr. Ellershaw not sighting the cyclist sooner, and that the question of rear lights is not involved in the incident at all? W. P. COOK.

THAT ELUSIVE LICENCE!

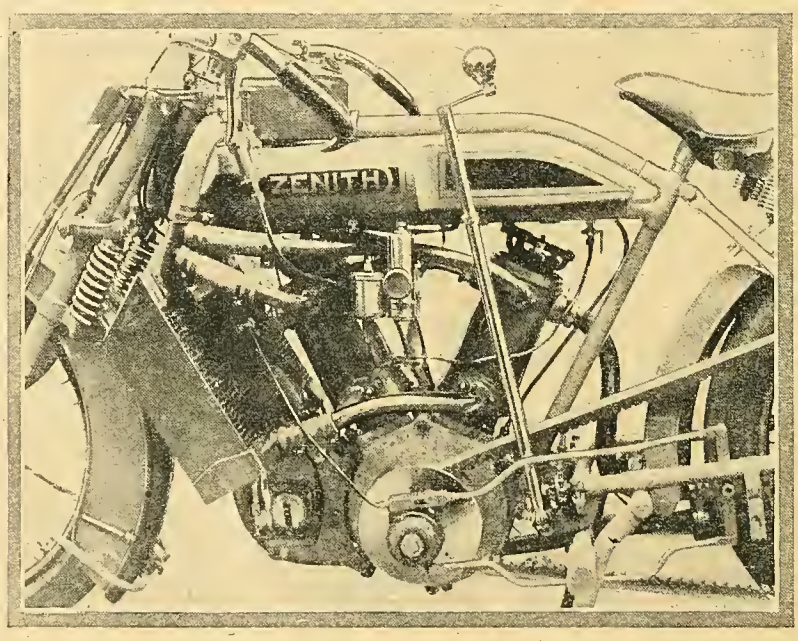
A driver of a Rover sidecar outfit searching for his authority to drive

An 8 h.p. Twin-cylinder Zenith-Green.



(1) The valve side of the machine and the silencing arrangements. (2) Showing details of the working of the Gradua gear. It will be noticed that water outlet pipes are provided on each side of the cylinders, and an additional water tank is fitted on the top tube.

THE accompanying illustrations show an interesting Zenith-Green motor bicycle supplied to the order of Mr. C. T. Freeman, Palmer's Green, Southgate, N., by Messrs. Maudes' Motor Mart. The most conspicuous feature is the 8 h.p. water-cooled Green engine, which, unlike other engines of this make, has a separate honeycomb radiator. The valve gear is of the ordinary overhead type found on the Green, so designed that if a valve breaks it cannot fall into the cylinder. The water jackets are, of course, of copper, and the water pipes and exhaust pipe of the same material. It will be noticed that the water pipes are of ample dimensions, and, consequently, the engine should keep extremely cool. The water is poured in through the small tank on the top tube, which also acts as an expansion chamber. The carburetter fitted is the well-known Binks three-jet model, while in addition to the Best and Lloyd lubricator an ordinary hand pump is supplied. The machine is fitted with a Stewart magnetic speedometer and Brooks saddle. No clutch is fitted, but the ordinary Zenith-Gradua gear, the top ratio of which is 3 to 1. Another interesting feature in the engine is the fitting of a glass window in the crank case to show the level of the oil. The bore and stroke of the engine is 85 mm. × 85 mm., giving a capacity of 964 c.c.



The new twin-cylinder V type 8 h.p. water-cooled Green engine.

A Popular Priced Levis.

WAR scares bring many horrors in their wake, but now and again a bright spot is discernible, and it is a direct outcome of the present crisis that we are enabled to announce that it is now possible to purchase a Levis lightweight for £25. In coming to the decision to place this model on the market, Messrs. Butterfields, Ltd., Stechford, state that their great desire is to keep as many of their employees occupied as possible, and that the new "Popular Levis" will only be available for a limited period. Therefore anyone who wishes to secure one should apply at once for delivery.

The engine of the 2¼ h.p. Popular Levis is 62 × 70 mm. bore and stroke, 211 c.c., and the Levis patented system of lubrication is employed. Choice of either an Amac or a Senspray carburetter is given. Ignition is effected by U.H. magneto. Druid forks, ¾in. rubber belt, number-plates, and 24in. × 2in. tyres form part of the equipment of this machine. The well known Baby model will still be marketed, and, of course, contains refinements such as it is not reasonable to expect on the low-priced Poular model.

The Waiting List.—Advice to those Volunteers who have failed to Obtain Military or Civilian Employment. A Military Model New Hudson. Activity in the Midlands and East Coast.

LAST week it was suggested that those motor cyclists who were unfortunate enough to find that their services were not required in the Army, either at home or abroad, or in the Special Constabulary force, should seek to make themselves efficient, from a military point of view, at the earliest possible opportunity so that when vacancies occur, as they surely will (probably in a very short time), the Government would be able to take on men who are not quite in the position of the raw recruit. Naturally, anyone who has had any military training will receive immediate consideration at the hands of the authorities, and will, of course, take precedence of those who have not been employing their spare time in the useful manner suggested.

How to become Efficient.

As the authorities are of opinion, and rightly so, that private enterprise is misplaced in training corps of men for defensive purposes, and that all work of such a nature should be done by Government direct, it follows that several associations started with the idea of affording training to men not yet selected for military service, have had to suspend operations. This, as a matter of fact, should give all the more stimulus to club executives, now that competitions are non-existent *pro tem.*, to get their members to exercise themselves so far as individuals can, in military arts and crafts. Rifle shooting can often be managed, and map reading—a far more important matter than may appear at first sight—can be taken up by every one. Another point which might well be studied is the question of uniform badges, so that in the event of a waiting applicant being called up, he may not have to spend valuable time finding out each officer's rank by learning his badge. All this may sound dull work, and doubtless it is not so exciting as the sensational delights of despatch riding, but every bit of work in the world has its tedious side, and war is not a pleasant occupation to anyone.

Like Father, Like Son.

That fine sportsman, Tom Silver, has had to abandon his projected tour on a Quadrant motor cycle from the Cape to Cairo, and now his only regret is that he is debarred by the age limit from joining the British forces once again. We say once again advisedly, for Silver has already been through three campaigns—Egypt, the Nile, and the Boer War. His son, H. Silver, however, is attached to the Royal Engineers (Southern) as a motor cyclist, so he is keeping up the family tradition.

Members of the Army Service Corps, whose machines include a number of P. and M.'s, are shown in camp on the North-west Coast.

A string of motor cyclists, with their ammunition car, in East Anglia. Scores of cars and motor cycles are at present being used in the Army without identification numbers.

Heroic Defence of the F.N. Works.

The F.N. Co. have their immense works in and around the besieged town of Liège. The extensive factory of this firm is situated at Herstal, a suburb of Liège, lying to the north of that town. Its position is just under one of the forts which have held out so nobly against the Germans, and north of it is Visé, the village which was lately burnt to the ground by the attacking force. Now information has come to hand of the magnificent bravery of the women employed at the factory. Nearly all the men, from the directors to the most humble workman, have been drafted to their regiments, and the factory was defended by women against the Germans, who swore that the enemy should never take it. They armed themselves with revolvers and other weapons, and repulsed several charges of Uhlans. When the ammunition was exhausted they barricaded themselves in and poured boiling water on the Germans, with the result that many were disabled.

A group of motor cyclist despatch riders assembled on a racecourse.

Competition Riders for the Front.

Needless to say, a large number of well-known competition riders are engaged in the war, and it is quite impossible to give the names of even a tithe of them, but we may mention that one of the best-known club secretaries, Harold Karslake, of the Motor Cycling Club, is at Farnborough, attached to the Royal Aircraft Factory, and expects to leave with the expeditionary force at any moment. Cecil Hann and Humphries, the Cardan driver, are also at Farnborough, while Leonard Goss (F.N.) and A. J. Sproston, the well-known T.T. rider, are also known to have volunteered for the front, and are probably there by this time.

Clubs and Rifle Ranges.

The Bradford M.C.C. has furnished the forces with a contingent of riders, and has a rifle range at Peckett Well, near Hebden Bridge, which may be reached from that town by taking the climb over the moors *viâ* Oxenhope. The secretary of the club is Mr. T. Bullus, 28, Manchester Road, Bradford. The practice of rifle shooting for club members has the warmest support of this journal.

Military Model New Hudson.

The New Hudson Co., with characteristic enterprise, has introduced a military model motor cycle. The machine is of the single-cylinder pattern and fitted with a standard New Hudson engine, but a three-speed counter-shaft gear similar to that used on the latest model twin has been neatly embodied in the bottom bracket. Chain and belt drive is retained.

The Supply of Magnetos.

Naturally, owing to the war, all supplies of magnetos to the Bosch Company from Stuttgart have ceased. The company has, however, sufficient magnetos in stock to last for three months with an ordinary sale, and, as the demand on its resources is likely to be less than normal, firms should have no difficulty in obtaining magnetos for some time to come. At present, however, the whole Bosch stock has been taken over by the War Office, but it is not anticipated that this state of affairs will last indefinitely.

Special Motor Constabulary.

Applications from motor cyclists for the Special Constabulary were considered one day last week, when great scenes of activity were noticeable outside Scotland House, S.W. The Special Constabulary have a few vacancies in their motor corps for owners of motor cars and motor cycles. The duties are purely honorary, and applications should be made in person to Mr. Basil Johnson, Directory of Transport, Scotland House, Scotland Yard, S.W. The response to the appeal has exceeded all expectations.

Vigilance on the East Coast.

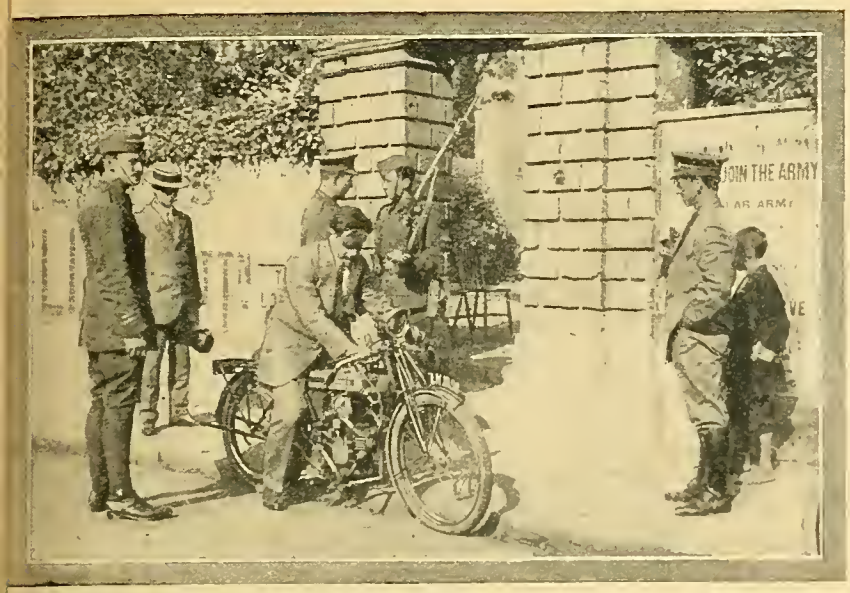
Our correspondent on the east coast reports that in many places on the east and north-east coast all motor traffic is held up by troops with fixed bayonets and loaded rifles. Licences must be produced, particulars of time, destination, etc., are taken. A search is also instituted in some instances of closed cars. Chief attention is being paid to roads leading from inland towns to the coast. The price of petrol is still high in many places and supplies are difficult to obtain.

The Clyno Company has shared in a Government order for motor cycles, a batch of machines being delivered to the War Office last week.

ARMY SCENES IN SUFFOLK

An energetic sentry

A sidecarist challenged



Captain Stafford passing a territorial motor cyclist for the waiting list, outside Fulham House, Putney, Headquarters of the County of London Regiment.

Motor Cyclists for the Army.

We recently had a few minutes interview with Captain Stafford of the County of London Regiment, who was appointed by the War Office to make the preliminary selection of motor cyclists for the Army. The work is practically now over, but he is still inspecting the machines of those riders who care to place themselves on the "Waiting List." We understand from him that those qualified have already started with the expeditionary force. After the motor cyclists have been selected by Captain Stafford they are sent on to the Royal Engineers at Chatham, where they are finally passed by the authorities.

Police Precautions with Motor Vehicles.

We learn that special police have been detailed at each entrance to Hull, who take full particulars of every car, cycle car, and sidecar which may pass, and check the drivers' licences. The only motor vehicles exempt from attention are solo motor cycles.

Wolverhampton Manufacturers.

A recent visit to Wolverhampton showed that the motor cycle manufacturers of that town are doing their best to cope with the present situation in a practical and commonsense manner. Though overtime has ceased with a very few exceptions the big firms will carry on their business steadily, and have sufficient confidence in their wares to put a certain number of machines into stock should necessity arise. The A.J.S. Co. have resolved to keep their works open, never having yet been able to fulfil every order received. The company have several interesting experiments at present under consideration. The Sunbeam also will continue manufacturing quietly, having still plenty of orders to fulfil. The Villiers well laid out works will continue to turn out quantities of their little two-stroke engines. Incidentally, we were able to examine some few alterations which are being carried out with a view to reducing four-stroking to an absolute minimum.

The Wulfruna works, in spite of the fact that a large part of their trade is done abroad, are busy producing machines, and on the whole the attitude of the manufacturers reflected the true British solidity which has made the nation what it is.

At the Clyno works we heard of a Government order which had just come to hand for sidecar outfits.

The Special Constabulary.

Motor cyclists who are desirous of enrolling themselves as special constables should apply to the Special Constabulary Office, Scotland House, New Scotland Yard, S.W., but they must understand that they give their services free and pay their own expenses. At the present time 180 have been enrolled.

More Normal Conditions.

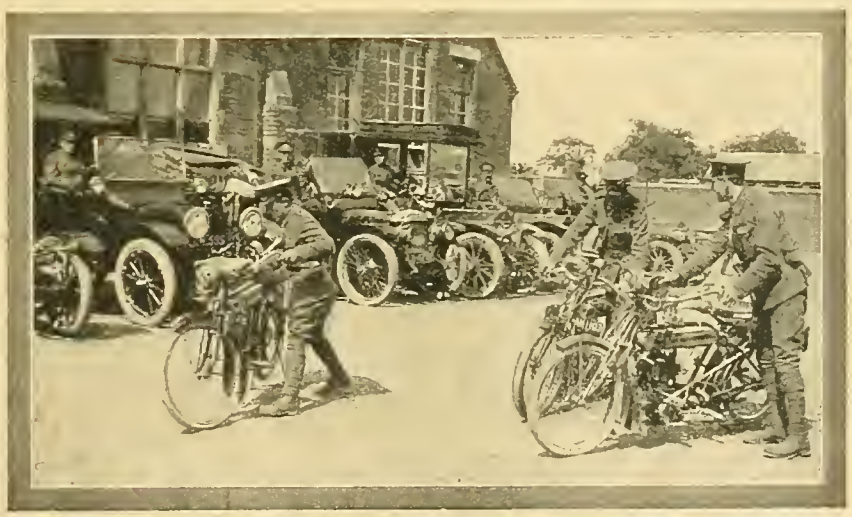
Since the early days of the war things are assuming a more normal course. There was much more activity on the road last week-end than there was the week-end before. All we want to cheer us up is the rousing news of the success of the allied armies on land or of the British fleet at sea. But we must be patient.

Birmingham Precautions.

The Birmingham authorities are taking every precaution to prevent undesirable persons entering the town, and all motor vehicles are stopped, licences are examined, and a few questions asked before the driver is allowed to proceed. On a recent occasion a member of our staff was stopped twice in one day. The police, however, were extremely civil and explained their duty pleasantly.

The Waiting List.

Everyone sympathises with the great private and even semi-public efforts that have been made to raise volunteer defence forces. One of the largest efforts in this direction was that of the body styled the London Defence Force, and therein it was proposed to enrol a large number of motor cyclists. This body, however, has had to discontinue its efforts, as Lord Kitchener does not look with approval upon any but purely Government measures in this direction. We are convinced that Lord Kitchener is right. He is the man in command, and, however disappointing it may be to the organisers and members of such forces, everyone must realise that the man in command is the best judge. Therefore, if any motor cyclists wish immediately to give their services, they should join the regular army, and when wanted as motor cyclists they will be just as efficient riders, and at the same time will have become efficient soldiers. This view of the case has just been confirmed by the Official Press Bureau, which body has issued a notice stating that it is Lord Kitchener's opinion that if private enterprises of this kind were encouraged or even allowed, recruiting for the new national army might suffer.



Despatch riders (supplied by the A.A. and M.U.) hurrying off with messages

THE M.C.C. AUGUST TOUR.

In last week's issue of *The Motor Cycle* we gave a list of the gold medal winners in the August Bank Holiday tour to the West of England organised by the Motor Cycling Club, and we now append a list of silver medal winners and are able to give some further interesting details of the behaviour of the competing machines. The timed hill-climbs up Porlock and Countisbury are the chief points to be noted, as minimum speeds were set, from 10 m.p.h. to 15 m.p.h., according to what class of machine was running. For the Cup standard higher speeds were demanded, ranging from 12 m.p.h. to 18 m.p.h. Those who know these hills will appreciate the severity of the test, especially when it is borne in mind that the road surfaces were deplorable. Fastest time up Porlock was made by F. W. Applebee (3½ Motosacoche), who travelled at 16.83 m.p.h. Countisbury presented fewer difficulties, and L. Mogridge (3½ Rudge Multi) attained a mean speed of 26.62 m.p.h. up the hill.

SILVER MEDAL WINNERS.	Average Speeds. Porlock.	Countisbury.

CLUBS AND RIFLE SHOOTING.

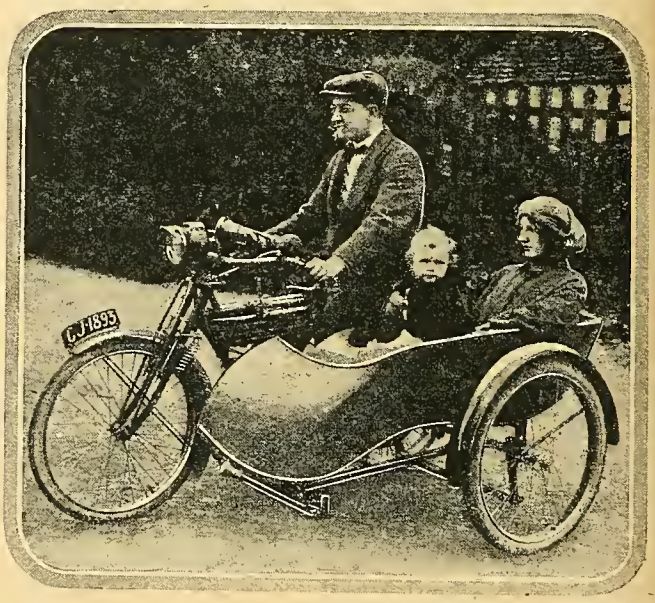
Apropos our notes last week *re* rifle shooting for motor cycle clubs, we have received an interesting letter from Mr. T. G. Bullus, hon. treas. Bradford M.C. and L.C.C., giving particulars of the rifle club section of the Bradford club. This section was formed at the beginning of the present year with about twenty members. Service rifles and Bisley targets are used, and service ammunition is provided at a low cost by the Rifle Club Association of Great Britain. Of course, members have to own their rifles, but arrangements are made to loan rifles to new members till they can obtain their own equipment. Practice takes place once a week, from 2.30 p.m. till dusk, on the rifle ranges on Hebden Moors, under the direction of two skilled instructors. This is a fine example of Yorkshire keenness, and that rifles and motor cycles have something in common to the Yorkshire mind is shown by the fact that Mr. A. A. Scott showed one of his machines at Olympia with a repeating rifle mounted on the handle-bar, and the machine equipped so as to stand up and be used as a quick-firing gun carriage. It is to be hoped that other clubs will follow the admirable example set them by the Bradford club.

SCENE ON THE BRADFORD CLUB RIFLE RANGE ON HEBDEN MOOR.

Instructor W. Lee is giving advice regarding altitude and windage. The men shoot in fours, two on each target. Three markers are in the butts, which are complete in every detail.

A LIGHTWEIGHT SIDECAR OUTFIT.

The growing popularity of lightweights has led to the introduction of lightweight sidecars. The outfit illustrated consists of a 2½ h.p. Alldays two-stroke machine with Sturmey-Archer gear and a Watsonian lightweight sidecar.



A lightweight sidecar outfit owned by a Hereford rider.

It is claimed by those responsible for the combination that it is capable of equalling the speed and hill-climbing powers of much more powerful machines. The combination is owned by Mr. Perkins, of Hereford, and was supplied to him by Waltis and Co., of that city. It is altogether a most interesting and novel turnout, but one which, in our opinion, should be used solely by light passengers.

MAP READING AND RIFLE PRACTICE.

The Coventry and Warwickshire Motor Club has arranged a lecture on map reading for to-morrow (Friday) at 7 p.m. at the King's Head Hotel, followed by a lecture on rifles. Both lectures will be brief. A rifle section is being formed.

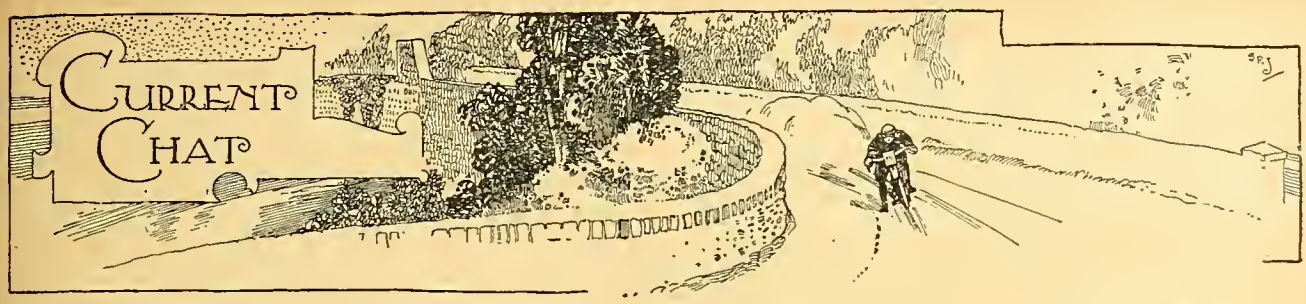
On Saturday afternoon at two o'clock, a test of map reading is to be held, when maps will be handed to members, who will be expected to follow the routes marked thereon.

The Coventry Club Committee has contributed ten guineas to the Prince of Wales's Relief Fund.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.



TIMES TO LIGHT LAMPS

Aug. 20	...	...	8.16 p.m.
,, 22	...	...	8.11 p.m.
,, 24	...	...	8.6 p.m.
,, 26	...	...	8.2 p.m.

The Motor Cycle on the Farm.

A motor cyclist, named W. Campbell, is having a special sidecar built for attachment to his 4 h.p. Triumph, in order to convey farm produce to market from a Hampshire village. This is one of many utilitarian services to which a reliable motor cycle can be put.

Meetings Abandoned.

The B.M.C.R.C. race meeting proposed to be held on Saturday, the 22nd, is abandoned, and the North-Western A.A. have decided not to hold their open hill-climb in September. The annual Coventry open hill-climb is to be held on August 29th.

The Matchless at the Front.

The three Matchless sidecar outfits taken to France by C. R. and H. A. Collier and R. E. Guest had to be left behind in Paris, and are now doubtless being utilised by our allies. These machines were magnificently fitted up, and each had a complete electric light installation, and it is doubtful if any finer outfits will be used in the war. R. E. Guest, it may be mentioned, has joined his regiment, and F. J. Ellis, the secretary of the Woolwich, Plumstead, and District M.C., is employed at the Arsenal. The inter-team trial which was to have been organised by this club has been abandoned.

An Excelsior Big Twin.

An Excelsior V type twin of 7 h.p. is at present in the pattern-making stage. Its bore and stroke will be 85 × 88 mm., and the valves are of the side-by-side pattern mechanically operated. The lubrication system is to be the same as on the single-cylinder Excelsior, *i.e.*, *viâ* the gudgeon and crank pins. This new mount is, of course, being designed primarily for sidecar use, and a point which might be considered more generally is that all adjustments as far as possible will be arranged on the side opposite to the sidecar in order to render them more readily accessible.

The Magneto Supply.

With the war has come a shortage of magnetos, Stuttgart, the source of practically nine-tenths of our supplies, having been cut off from us. Therefore, the chance of the British manufacturer of magnetos has come, and the chief motor manufacturers held a meeting in Coventry last week to further this project. The efforts to encourage home-made magnetos is rather tardy, but now it has been made we sincerely trust it will not be allowed to drop, and that out of temporary inconvenience permanent supplies may be assured. In last week's issue of *The Motor Cycle* we described the new B.T.H. magneto, for which a bright future is confidently predicted.

It is not realised generally that the Bosch Magneto Company have a large magneto factory in the United States, and it is possible that in the event of a serious shortage magnetos may be obtained from this source, or they may be even manufactured in this country.

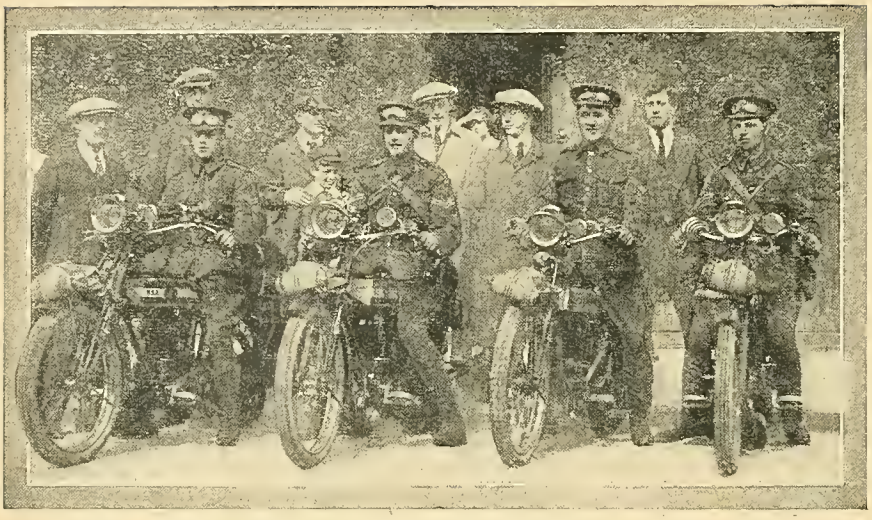
SPECIAL FEATURES.

MOTOR CYCLES IN WARFARE.
SCOTT, MORGAN AND F.N. IN IRELAND.
THE SIDECAR FOR BUSINESS PURPOSES.

Insurance Policies and the War.

Motor cyclists whose machines are being utilised in Government service are reminded that no existing insurance policies on their motor cycles hold good at the present moment. It is possible, however, that the great insurance companies may be able to formulate some scheme to remedy this state of affairs, but no pronouncement can yet be made on this point.

A despatch rider attached to the Brigade Staff of the Fifth Yorkshire Regiment. The machine is a Scott



WELL-KNOWN BIRMINGHAM MOTOR CYCLISTS ON THE POINT OF DEPARTURE FOR ACTIVE SERVICE.

Left to right: Howard Newman, the well-known Ivy rider; Roy Lovegrove, Scott T.T. rider; Ernest Sarsons, a Birmingham manufacturer and motor cyclist; S. W. Kitchen, a 1914 T.T. rider of an Abingdon. Each rider is astride a new machine (three B.S.A.'s and a Triumph) fitted up most completely. No registration numbers are required.

The Cycle Car Race in Doubt.

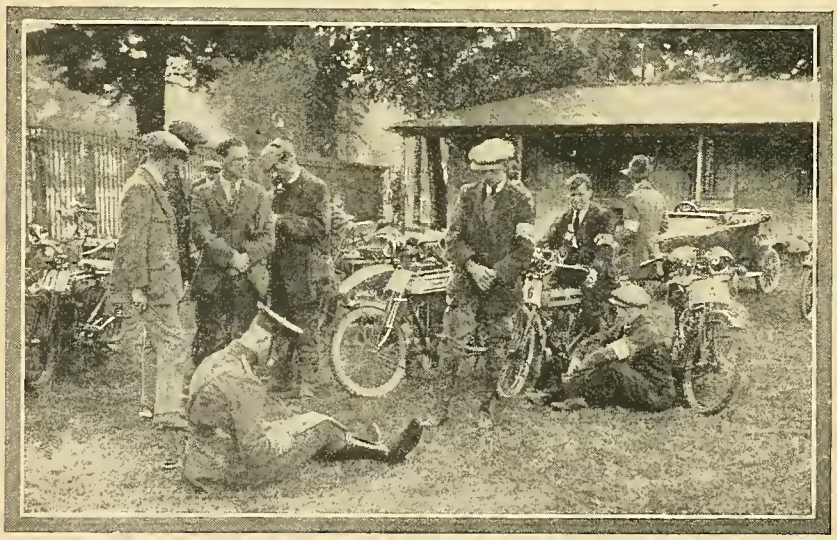
At the present time the A.C.U. is undecided as to the fate of the race for cycle cars and light cars in the Isle of Man, and it is likely that the final decision on this matter will not be arrived at until one month before the race.

Bandsman Blake as Scorcher.

Bandsman Blake was charged before the West Flegg Norfolk magistrates one day last week for riding a motor cycle on the highway near Yarmouth to the common danger of the public, but, as both the well-known pugilist and the constable who had stopped him had been called to the war the case was dismissed, the Chairman of the Bench stating that the defendant had gone to serve his country and everyone was useful at the present time.

Cycle Car Drivers in France.

W. Chater-Lea and C. Pressland arrived back in England last week after a most exciting trip on their Chater-Lea and Crouch cycle cars. When we left the pair at Grenoble on August 2nd they were thinking of returning *viâ* the Galibier Pass, one of the most difficult climbs included in the International Six Days Trials course. We learn that both succeeded in making the ascent, and, indeed, thought less of it actually than they had been led to expect. The ascent necessitated 3½ miles of low gear work. Many exciting incidents, as may be imagined, were crammed into their long trip across France, and finally the cycle cars had to be left behind at Dieppe. While sympathising with the drivers, we congratulate them on emerging successfully.



SCENE IN THE EAST MIDLANDS. The Colonel of the regiment writing despatches while motor cyclists wait around him for instructions.

The Special Constabulary Force.

For the Warlingham district no fewer than sixty motor cyclists have been enrolled, and are being equipped with revolvers by the local residents. Their duty will be the guarding of railway bridges, etc.

British-made Magnetos.

At the present time it is of great importance that British-made magnetos should be brought to the notice of manufacturers and the public. Last week we described the B.T.H. machine, and it is not generally known that Messrs. Thomson-Bennett, Ltd., Cheapside, Birmingham, have been making all-British magnetos in a quiet way for the last seven years, and can supply several patterns to suit single and twin-cylinder engines. Messrs. Thomson-Bennett point out that "now is the time, while there are still stocks for immediate requirements, when arrangements should be made for the future, as it must necessarily take time, even with others entering into the business, before a steady flow of new machines will be obtainable."

OUR ADVICE TO CLUBS.

At a time when every motor cyclist is anxious to serve his King and Country, and when all army vacancies are for the present filled, the advice of "THE MOTOR CYCLE" to Club Committees is to encourage members to cultivate assiduously an intimate knowledge of their own particular localities and to become well versed in the art of map reading, so that, if their services may be required eventually, they will be as useful as possible.

Ordinary competitions having been cancelled, Clubs might well arrange map reading contests and reconnaissance tests in districts not occupied by troops.

The Price of Petrol.

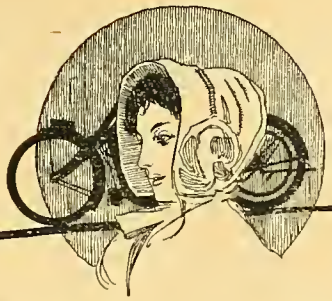
We hear that the Colmore Depot's campaign against inflated petrol prices, announced in our Correspondence columns last week, has met with immediate success. We are informed that the petrol companies gave the Colmore Depot every assistance in meeting the demand, but that, on the other hand, 2s. 6d. per gallon wholesale was asked by one firm for benzole.

BRITAIN'S BEST MOTTO: "BUSINESS AS USUAL."

After careful consideration the Coventry and Warwickshire Motor Club Committee has decided to hold its open hill-climb announced for Saturday, Aug. 29th. A number of manufacturers have promised their support, feeling that it is in the best interests of the trade that competitions be revived. There are eleven classes on the programme, embracing motor cycles, sidecars, and cycle cars of all types, and it has been decided to extend the entries until Monday next, first post.

The secretary of the event is Mr. H. Whiteman, Greyfriars Chambers, Hertford Street, Coventry.

Two Lady Riders in Germany.



Exciting and Unpleasant Adventures on the Eve of War.

By MISS W. J. SCOTT.

WE started off on our trip by motor cycle to Bayreuth so peacefully on the 15th July, never dreaming of the possibilities of war, and here we are back again on the 4th August, all that is left to us of the two bicycles being a spare belt, an inner tube, and a sparking plug.

Our outward journey seems tame now, but at the time it was quite interesting. We left the Isle of Wight by the 7.15 a.m. boat to Southampton, rode up to London, had the motor cycles put on board the *Batavier V.*, and arrived the next morning at Rotterdam. In due course we passed through the formalities of the Dutch Customs, had our passes signed, and duly arrived at our destination, Lensden, near Amersfoort, where we stayed two nights. We were much disappointed at the state of the roads in Holland. The main roads are paved all over, and are in such bad repair that it was impossible for us to go faster than about fifteen miles an hour. Alongside some of the roads there are special paths for cyclists, which are often very good and smooth, and we were thankful whenever we could get on these. During the next few days we went through the usual vicissitudes of a motor cyclist—punctures, a little carburetter trouble, belt and clutch slip, etc.—but nothing really to hinder us, and we slept the nights at Rheinberg, Niederbreisig, Wiesbaden, and Würzburg. The scenery round Wiesbaden is very lovely and the roads excellent. We stayed in Wiesbaden itself for two days. After leaving Würzburg our luck with fine weather changed, and we were caught in a terrific thunderstorm, and forced to stay the night in a most primitive wayside inn at Rupertsburg, near Eichstätt, where our supper and breakfast consisted of black bread and coffee. The next day we rode through most beautiful scenery and along a fairly good road to Regensburg. From there to Bayreuth was only an easy day's run, but the clutch on my friend's machine kept slipping on every slight gradient, and the clay roads, owing to the heavy thunder showers, were like butter, so we eventually stopped at the little village of Haag, and reached Bayreuth on the morning of July 25th. There we spent seven days of peaceful sight-seeing and opera-going, often going for little tours on our motor cycles. On these, as everywhere else on our trip out, we found everybody very kind and always civil. It was only natural that we were a great source of interest, as ladies are practically never seen on motor cycles in Germany.

(Above) Miss W. J. Scott and (below) Miss J. Dickinson on their 2¾ h.p. Douglas machines.

War and Rumours of War.

There were no English newspapers to be had, and except that we heard that Austria had declared war against Servia, there was not even a rumour of our finding any difficulties on our homeward way until the evening of the 1st of August, when the news began to be disquieting, and we were warned that passports would require to be looked at and so forth; also when we went as usual for our Poste Restante letters they were refused us, and we heard that the post was in the hands of the military. That evening we heard that 4,000 soldiers were to be quartered in the town on the following day.

All the English and Americans then began to make hasty preparations for an early start, we among the number; but even then there seemed nothing to make us think of encountering any real difficulties. On August 2nd, a Sunday, we started off at 7.30, the first real intimation of warlike preparations being that the man at the garage only allowed us to fill up with petrol behind a building where we could not be seen, as *all* petrol was requisitioned by the Government. Well, we started off, and for the first fifteen miles or so we were not interfered with, nor did we see any soldiers or any military preparations, and so we came to Kulmbach, the first town on our route. Here we turned off

Two Lady Riders in Germany.—

for Lichtenfels, on the way to Eisenach and Cassel. Just beyond Kulmbach my companion had a puncture which delayed us some little while, and as we started onwards we met all the village people just coming out of church. They stopped us, the men demanding to see our papers. These, fortunately for us, were all in order, passports, bicycle passes, German tax papers, etc., and we were allowed to proceed. Hardly were we through the village than we came to a level crossing, where three or four men were busily shutting the gates, and others were as hastily loading their rifles with ball cartridges.

Arrested!

We were hauled off our bicycles and told to consider ourselves under arrest. Three or four men with fixed bayonets walked in front, and as many behind, and about a hundred peasants accompanied us. It was an awfully hot day, and my cycling clothes were thick and heavy, so I began to find pushing my bicycle a rather fatiguing game, and began to lag behind, and told my friend to do the same, but in a moment the guards shouted at us to go on faster or else the bayonets would be used. After some ten minutes or more we got to the station, where the waiting room was made into a temporary guard room, and we could sit down. We were told that the gendarmerie from the nearest town had been sent for, and that they would decide what was to be done with us. In due course four men arrived, thoroughly examined all our papers, and then searched our suit cases for incriminating papers of any description. Needless to say they found nothing. They told us that news of us had been telephoned all along the line from Kulmbach, and that we should be stopped at every level-crossing, at every bridge, at every cross-road, and at every village, and that in case we changed our route, our description had been telephoned on to every cross-road in the neighbourhood. We asked these people, who were quite nice to us, to be kind enough to give us some kind of a permit, which would enable us to get on unmolested. This they did and we got on for a mile or two, were stopped at the first bridge, showed our paper, and were allowed to pass on.

This cheered us up considerably, and we entered the next village quite unconcernedly, and had almost got through it when we encountered another hostile crowd who stopped us, examined the paper again, and were just on the point of letting us go when they discovered that the paper had no official seal on it. This was quite enough, and we were instantly arrested for the second time. Having learnt by experience that no breathing time was allowed, I quickly divested myself of my heavy coat and knapsack, got them on to the bicycle, and we started the march back all through the village, being reinforced at every moment by soldiers and crowds of villagers. These were not quite so hostile, and we got help from some of the boys in pushing the bicycles, which was a great relief to us. At the station, where we were again examined, was a young German officer, who told us we had much better give up all idea of proceeding on our bicycles, that no pass would really help us, that the further we went the more military we should encounter, and that he strongly advised us to go on by train, and told us he would give us a permit to take us as far as Lichtenfels, where we could get a train for the frontier. This he did, and, loth to leave our machines behind, we started once more for Lichtenfels by road.

Ochsenfurt near Würzburg.

View from bridge near Mainz over the Main.

The Town Hall at Ochsenfurth near Würzburg

Rough Reception from Hostile Crowd.

On the way we were held up several times, but allowed on again after our paper had been shown. About half a mile from the town we overtook a noisy band of Reservists, and these, when they discovered we were only two ladies, shouted to us to stop, and as this was done not quite quickly enough for them, they absolutely dragged us off our bicycles. I believe that these men had no right whatsoever to stop us, but they were uproarious and I suppose thought it a bit of fun. We were very roughly handled by them, but eventually one older-looking man amongst them came forward, looked at our passports, etc., and allowed us to proceed. We were then within sight of the town, and rather heaved a sigh of relief to think that we should at last get a little peace. But this was not the case, for at the entrance of the town we were met by one of the ugliest and most hostile crowds I have ever seen. We rode quietly side by side so as not to get separated, and then came the order "Halt! or we shoot." Some of the men ran off for the police, leaving us in the middle of the

Two Lady Riders in Germany.—

road closely guarded by soldiers and civiiians. One would have thought we were the most dangerous spies caught red-handed; they could not have treated us worse. They shouted to us that if we attempted to move or speak to each other we should be instantly shot.

An old man standing in front of me then began talking to me; he was quite friendly, really, of better class apparently than the rabble around us. He said he could not understand why two respectable ladies should be riding motor cycles instead of staying quietly at home. Did we not know that war was declared, etc., etc. I answered him that, of course, I could quite understand his point of view, as he *was* at home, but that we were *not*, and, although we were trying our very utmost to get there as quickly as possible, he and his nation were doing their utmost to prevent it. This seemed to appeal to his sense of humour, and he then began to call the ruder boys and girls to order. They were just beginning to get out of hand, pulling at our hair, snapping their fingers in our faces, and so forth, and then he suggested to the calmer of the guards that they should escort us at any rate into the shade, and not keep us in the broiling sun.

Kindness from the Police.

Much to our joy we were soon met by uniformed police, who escorted us and kept off the crowd, who then contented themselves with shouting, "To prison, to prison." The chief of police was excessively kind to us, and helped us in every way. He brought us into a room, had the bicycles guarded by police, cleared the streets, and then proceeded to write a further permit for us as far as the Dutch frontier. He added to his kindness by accompanying us to the station, and, while he assisted my friend with the machines, I went to get the tickets. I was asked for my passport, which I showed, also I told the man I should require tickets for the motor bicycles, and that the chief of police was on the platform with us. Whether or not he believed me I do not know, for at that moment someone outside the station recognised me, and in a moment the whole building was swarming with men and boys, and the man at the ticket office, telling me to wait a moment, went out by a side door and fetched in a whole band of soldiers. Seeing I was going to be instantly surrounded and separated both from my friend and the chief of police, I made a dash, ducked under the bayonets, and flew through the crowd on to the platform just in time to find the chief saying good-bye to my friend, believing all was well. He was perfectly furious, white with anger at the brutal behaviour of his countrymen, and just hurled abuse at them all, told them what curs they were to bully two perfectly harmless and helpless women, insisted on the tickets being then and there handed over to us, and a telegram despatched to Würzburg to say we were not to be interfered with, but were to be helped to the frontier.

We said good-bye to the Chief of Police with real regret, for had it not been for him I scarcely think we should have left Lichtenfels that day

Over the Frontier at Last.

Two Dutch youths gave up their places to us, otherwise we could not have had a seat at all, but the bicycles had to be left behind. At Würzburg we booked to Utrecht, the only Dutch town to which tickets were issued. All through the night we were continually leaving one train for another, but reached Cologne about 6 a.m. and Utrecht at 2 p.m. Thence, with many difficulties, we proceeded through Hilversum and Amsterdam to the Hook of Holland, where, after spending the night on the wooden Customs benches, we embarked for England. Outside Harwich we were ordered to stop, and escorted in by a submarine. It seemed almost too good to be true to find ourselves back once more on English soil after the experiences of the past days. One thing which greatly surprised us was to find that even then—on Tuesday afternoon, August 4th—we were not yet at war with Germany, though we had been subjected to such gross treatment at the hands of the Germans.

What makes the retention of the two machines more vexing still is the fact that Miss Dickinson is attached to the Hants. Red Cross and is needed as a despatch rider. If any reader is willing to loan another mount to Miss Dickinson until the close of the war, or to provide her with means to obtain one, such an offer would be gratefully accepted.—Ed.

CLUB NEWS.

Regent's Park M.C.C.

A run took place from London to Lynn recently combining a flexibility test. There were no secret checks, the prizes being awarded on correct time, general condition, and reliability. The results were as follow: 1, A. C. Robbins (4 L.M.C.), silver cup presented by Mr. John Newell; 2, G. Williams (5 Zenith), gold medal; 3, A. Stafford (7 Matchless sc.), silver medal.

Finsbury Park C. and M.C.C.

A flexibility test consisting of a fast and slow hill-climb in which the same gear ratio had to be used throughout was held recently near Pangbourne. The Touche Challenge Cup and gold medal is awarded to the rider scoring the highest aggregate on the results of this event and a speed-judging test which will be held on August 22nd. *The Motor Cycle* formula was used, $\frac{1{,}000\,W}{C \times T^2}$ for the fast and $\frac{W \times T}{1{,}000\,C}$ for the slow, the highest figure winning in each case. C. W. Cooke (3½ Triumph) proved to be the winner of both climbs in 1m. 18⅕s. and 5m. 24s., giving 0.127 and 0.25 respectively. The fastest time was made by J. Evans (5-6 Bat).

Midland A.C.

The hill-climb which was arranged to take place at Shelsley Walsh has been definitely abandoned owing to the European crisis.

Oldham and District M.C.

A gymkhana was held last week in a field at Nont Sarah's, and included a tug-of-war, which was hotly contested and ended in a tie, as the rope broke. A musical evening followed.

York County M.C.C.

The complete results of the reliability trial to London and back are as follow:

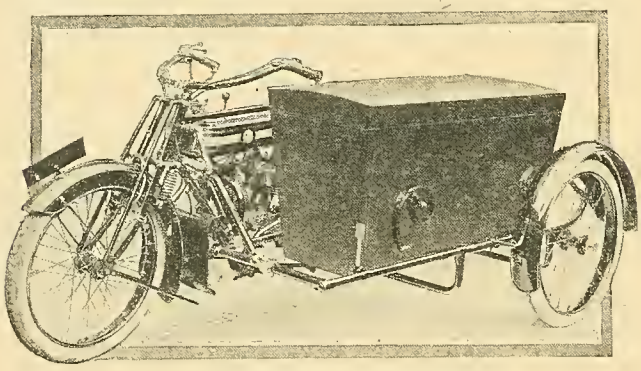
WINNER OF BYROM CUP.—H. H. Charge (3½ Rudge sc.)
WINNER OF SPECIAL GOLD MEDAL.—A. C. Thornton (3½ Rover).
WINNER OF STANDARD GOLD MEDAL.—G. Heminway (4 Triumph sc.)
WINNERS OF SILVER MEDALS.—F W. J. Bell (6 Rex sc.), T. Child (6 A.J.S. sc.), R. T Cawthorne (3½ Triumph sc.), E. Lunn (3½ Triumph sc.), and J. A. Wilkinson (6 Rex sc.)
WINNERS OF BRONZE MEDALS.—A. Waterman (6 Zenith sc.), A. Lunn (3½ Triumph sc.), W. E. Asquith (5 A.J.S. sc.), A. J. Burton (4 Singer sc.), G. R. Hanby (3½ Scott sc.), G. E. Hawkin (3½ Triumph sc.), W. S. Spencer (3½ Triumph sc.), and C. R. Foster.

It will be noticed that nearly every prize was won by a sidecar combination.

The Sidecar as a Commercial Vehicle.

A Cheap Method of delivering Light Goods over Scattered Areas.

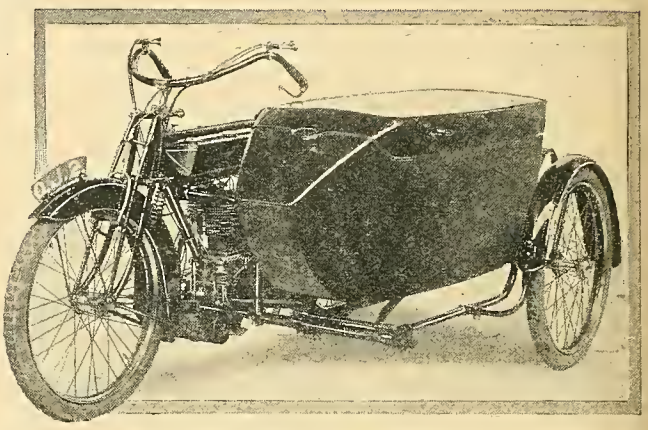
THOSE of our readers who have goods to deliver, and who have suffered by the wholesale commandeering of horses for the Army, would do well to consider the advisability of pressing into service a sidecar outfit for the conveyance and delivery of light goods. To bakers and grocers in particular a sidecar delivery van should appeal. These machines are very light in weight, cheap to run, and their first cost is moderate, and there is the further advantage that immediate delivery can be obtained in most cases. We illustrate three specimens of these outfits from manufacturers who have been quick to realise the immense usefulness of the sidecar delivery van, especially in view of the shortage of horses. Many tradesmen in comfortable circumstances who have received or will receive payment for the horses which have been commandeered for the Army would require to lay out but a little extra to purchase a sidecar vehicle of the type illustrated, and it is certain that such a machine could easily do the work of two horses, and can be tended and driven by any intelligent youth over fourteen years of age.



A Rex-Jap commercial sidecar outfit.

The Rex-Jap Commercial Sidecar Outfit.

We illustrate above an example of how the Premier Motor Co., Ltd., Aston Road, Birmingham, are meeting the demand for light commercial goods delivery work. This is not the only pattern made by the firm, for they have also just delivered several sidecars to Messrs. the Midland Vinegar Co., Ltd., for use by that firm's travellers, which have been specially fitted up to accommodate the personal effects and samples of the travellers using the machines. The chassis is identical with the one illustrated, and is remarkably strong and has four point attachment, fitted with the P.M.C. patent Quickfit couplings, which prevent misalignment of the sidecar under even the severest stresses. 650 × 65 Voiturette tyres are used, and the sidecar wheel runs on a car type spindle. Altogether, these outfits strike an important note in the use of a sidecar for definite commercial purposes, and, although eminently utilitarian, they are beautifully finished. We believe that outfits of this type will rapidly come into their own now that so many tradesmen are left horseless, and it is refreshing to see signs already of many firms preparing to supply the demand that will assuredly arise.



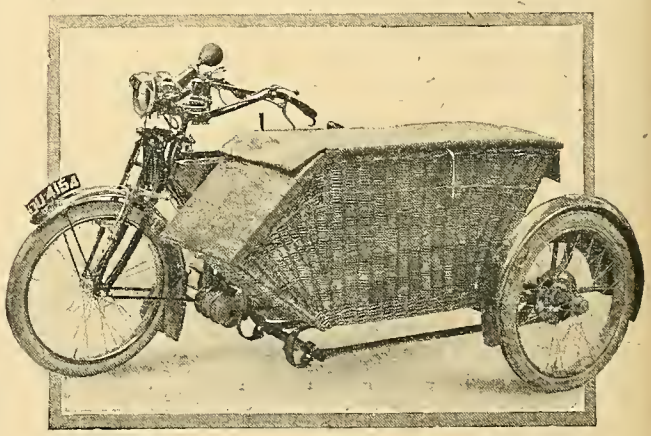
The James-Canoelet delivery sidecar.

The James Motor Cycle Carrier.

The James Cycle Co., Ltd., Greet, Birmingham, have produced a very handsome side carrier for goods delivery. The main portion of the side carriage is a James Canoelet. The upper part of the sides and back has been levelled, and a very neat and well-finished coach-built top has been fitted. This is hinged at the driver's side, and two lifting handles are provided. The body is interchangeable on the chassis with an ordinary touring Canoelet body. The James outfit is highly finished throughout, and presents a very handsome appearance.

The Excelsior Outfit.

Messrs. Bayliss, Thomas and Co., Excelsior Works, Coventry, have also seized the moment to place a soundly constructed and very moderately priced carrier on the market, which is, of course, attached to their well-known Excelsior motor cycles, which have obtained so enviable a reputation for hill-climbing powers. The model we illustrate is one which was produced rather rapidly, and we understand that modifications may be made in future models which will give greater carrying capacity. The carrier is interchangeable with an ordinary sidecar body.



The Excelsior-Millford sidecar carrier.

Six Days of Trials.

English Motor Cyclists' Adventures in France in Time of War.

AFTER the abandonment of the F.I.C.M. Six Days Trials, the British Consul at Grenoble had advised us to get out of the country as quickly as possible, and things to us began to look rather serious. There were four in the party—myself with a Connaught, W. B. Little with a Premier, and R. A. Bishop with a Royal Enfield sidecar and passenger. Our tanks were all nearly empty, but we put our trust in good luck, and started off at 11 a.m. on our journey to the North Coast. The streets in Grenoble were rather quiet, for a lot of the troops had gone away by train in the early morning. Our luck was in all right, for we came across a small garage in a village two miles out of Grenoble where we obtained enough *essence* to fill all the tanks. This eased our minds a little, and we accelerated speed up to forty and forty-five miles; one speedometer jammed at fifty-eight, so we were "travelling some." We kept on at this rate till we reached a small place named Bourgoin, where we had lunch. I rather think we might have got into trouble at this place, for a French soldier ordered us to garage our machines in a shed and not to take them out again, but as he had disappeared when we came out of the hotel, our machines disappeared also, as fast as we could make them, on the road to Lyons. It was nearly 4 p.m. when we neared Lyons, keeping well together all the way. It took us some little time to find the way through the town, but we were soon on the road to Roanne.

A Breakdown delays us.

My old two-stroke was running splendidly, and I kept well ahead, for the road was fairly good though twisty, and well fitted up with guide posts. On reaching the *octroi* at Roanne, about 6.30 p.m., I pulled up to wait for the other two, but as they had not appeared in sight after twenty minutes waiting, I jumped on the machine and rode back to see what was wrong. I found them about twelve miles back at a village called l'Arbresle; the Enfield had developed bearing trouble in the back wheel, and it was impossible to repair it. We tried our best with the tools we had till 10 p.m., and then gave it up. The villagers crowded round us and gave us moral support, which was not worth much, but better than having bricks thrown at us. We stayed the night in l'Arbresle, and in the morning, after a council of war, we left the Enfield at the hotel, and then went back to Lyons to see if we could obtain a spare ball race for the back wheel. Bishop and his luggage rode on my carrier, and Little took the passenger and *his* luggage.

We reached Lyons safely and went to the Motosacoche depot, but found out that we could not get a spare in the whole town. We were in a fix all right. So off we went to see the Consul, for things began to look a wee bit serious, and not one of us had a passport. When we got to the Consul's office, there were about sixty waiting their turn to see him. Two girls fainted in the crush while we were there. However, we got certificates of registration after waiting eight hours and went outside again.

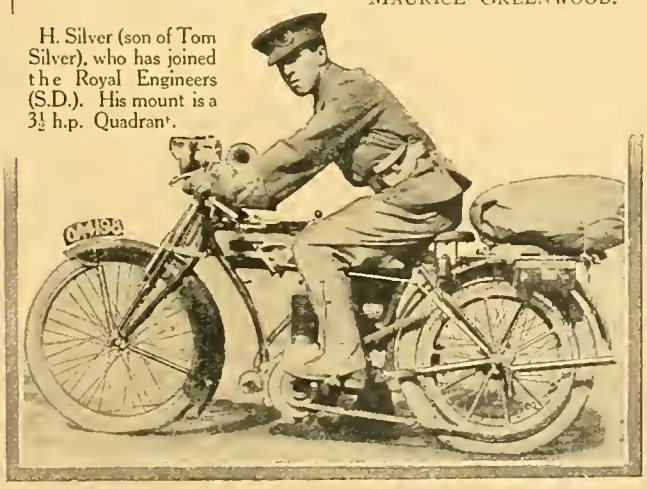
Our Machines are Commandeered.

We had barely got into the street again, when three soldiers came up and informed us that they required our machines to be left with them as they would be required for national service. This put us in a worse plight than before, but there was no help for it, according to the Consul, so we obtained receipts for the two machines and left the receipts in the care of the overworked Consul.

It was hardly a nice situation for us; stranded in a foreign country in a state of war. If they had left us our machines, we should not have felt so helpless, but there we were and we had to make the best of it. We asked the Consul's advice, and he promised to get us on a troop train which was leaving for Paris at noon the following day, Tuesday. He fulfilled his promise, and Tuesday, 12.30, saw us steaming out of Lyons in a crowded troop train at the headlong speed of ten miles per hour towards Paris. We did not worry about the speed as long as we got there. It was 2.30 p.m. on Wednesday when we arrived at Paris.

We had to find the Consul in Paris and see what he could do for us, and after a weary and anxious wait of eleven hours, we boarded the train for Havre, and arrived at that port at 9.30 a.m. on Thursday. The boat left Havre at 11 p.m. the same day, and, after a very crowded crossing with all lights out, we arrived at Southampton about 8 a.m. Friday, glad to get back to Old England. The first thing was a good English breakfast and then home.

MAURICE GREENWOOD.



H. Silver (son of Tom Silver), who has joined the Royal Engineers (S.D.). His mount is a 3½ h.p. Quadrant.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Choice of Medium-powered Engines.

I want to replace my 2 h.p. engine with one of greater power, but am undecided whether to have a 3½ h.p twin, a 2¾ h.p. single, or a two-stroke. I use my machine for taking a passenger on the carrier. I do not want a big heavy engine. I am all in favour of the 2¾ h.p. single, but should very much like your advice as to which engine you consider the most suitable. I shall fit a change-speed gear of some type.—G.A.T.

Since you go in for passenger carrying, we should advise you to obtain a 3½ h.p. twin engine. You would then have a fairly good reserve of power, and you would not have to run your engine all out as you would do with a single cylinder of small capacity. You are quite right to use a variable gear, and such a machine so equipped would take a sidecar and passenger quite comfortably when required. If you only carry a passenger very occasionally the small two-strokes are admirable.

Removing Compression Plate.

I have a 1913 3½ h.p. three-speed single-cylinder machine with coachbuilt sidecar, which I purchased second-hand. Recently I removed the cylinder to remedy an oil leakage between the cylinder and crank case and I found a $\frac{1}{16}$in. plate fitted between the cylinder and crank case. I would like to know for what reason the plate has been fitted in, and whether it would be advisable to remove it in order to obtain more power. The machine has a hub gear and I cannot get the knack of starting on the clutch. Can you advise me?—A.Y.

In all probability the previous owner wished to lower the compression slightly to get slower running or easier starting. It is quite likely it might make a difference in the power developed if you removed the plate. It certainly would not harm the engine in any way to do so. If the clutch is in proper adjustment and satisfactorily lubricated you should be able to start away easily and the drive should be picked up sweetly. You should let the clutch in gently, and, at the same time, open the throttle very slightly. But be content with a slow and gentle start and do not aim at rapid acceleration, for we do not suppose you will ever be able to get the quick acceleration that you do with a car when starting, especially as the machine is a single-cylinder.

Trouble with a Generator.

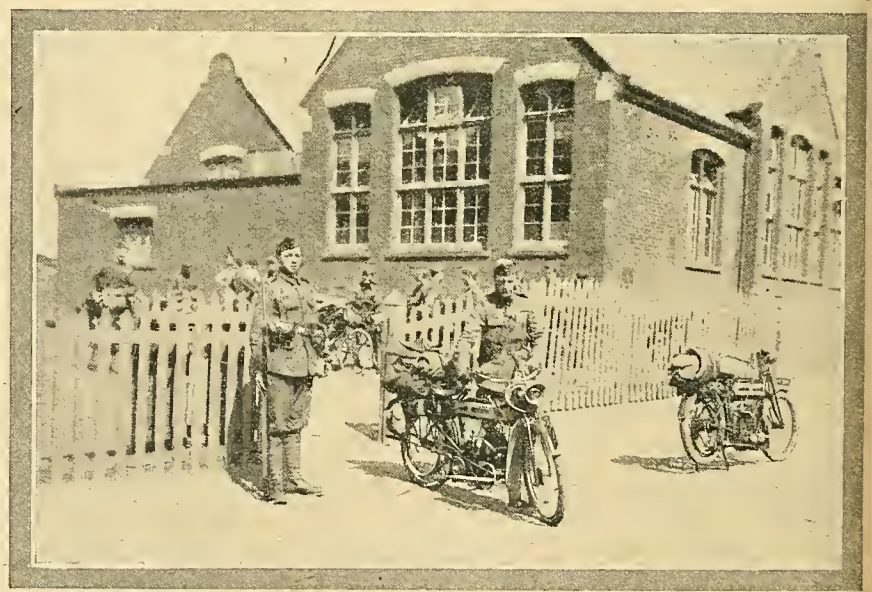
I should be glad if you would advise me on a small point that is rather worrying me. I have a large lamp, and find that after having lit it for about an hour a large quantity of water, together with some carbide dust, collects at the bottom of the container, with the result that when I go over a bump in the road this water is flung up into the carbide container, and the lamp flares up for quite a long period, and forces the water out of the small hole in the filler cap. The outcome of it all is that when I remove the generator at night I find nothing but sodden carbide in it, and the lamp, for which is claimed a six-hour capacity, has lasted two hours.—T.N.

It would seem that there is a leak somewhere in the gaspipe, and that in order to get sufficient gas to go through to the lamps as well you have to use a very large flow of water, which accounts for the carbide being used up quickly. We should advise you to test the joint carefully for any leaks that might occur. If you get a good steady pressure of gas you will find that your lamp will not flare when you pass over rough surfaces. You must also make certain that the rubber gastight ring between the two halves of the generator is fitting perfectly.

Taking a Sidecar to the I.O.M.

I shall be pleased if you will kindly advise me which is the speediest route from Basingstoke to Port Erin, Isle of Man, *viâ* Liverpool, and whether it is worth while shipping my motor cycle and sidecar to the Island for a week. If so, what are the freight charges, and is it necessary for me to detach the sidecar?—A.G.A.

Your best route from Basingstoke would be *viâ* Kingsclere, Newbury, Lambourn Faringdon, Cirencester, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Wellington, Hodnet, Whitchurch, Chester, Birkenhead, ferry to Liverpool, thence to Douglas by the I.O.M. Steam Packet Co.'s steamer, and by motor cycle to Port Erin. We certainly advise you to take your sidecar with you, as it will prove invaluable for sightseeing in the Island. The freight charges are quite moderate, about 5s. for the outfit, but with certain boats it is necessary to detach the sidecar before embarking.



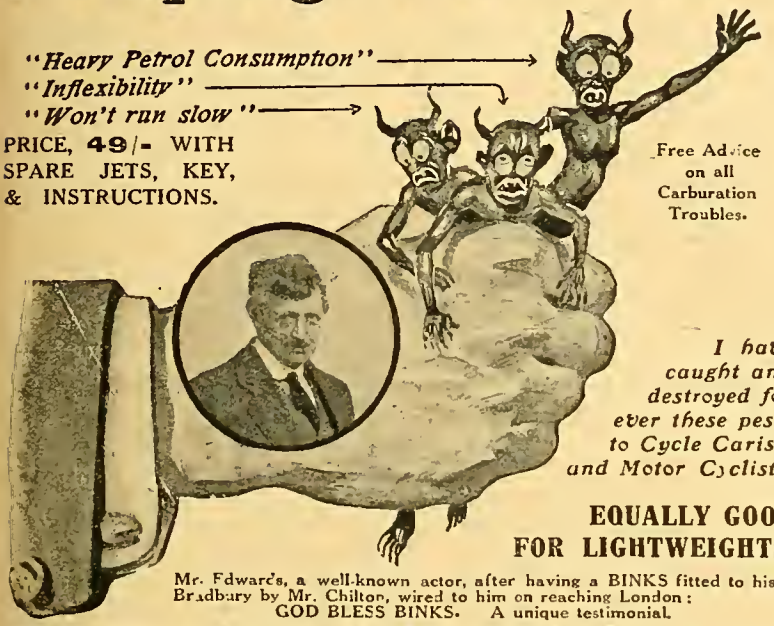
Motor cyclist despatch riders on the East Coast, whose company is using a school and playground as their temporary headquarters.

STARTLING IMPROVEMENT IN CARBURETTERS.

The BINKS 1914 Automatic Jet Damping Pilot Jet Carburetter.

"Heavy Petrol Consumption"
"Inflexibility"
"Won't run slow"

PRICE, **49/-** WITH SPARE JETS, KEY, & INSTRUCTIONS.



Free Advice on all Carburation Troubles.

I have caught and destroyed for ever these pests to Cycle Carists and Motor Cyclists.

EQUALLY GOOD FOR LIGHTWEIGHTS.

Mr. Edwards, a well-known actor, after having a BINKS fitted to his Bradbury by Mr. Chilton, wired to him on reaching London: GOD BLESS BINKS. A unique testimonial.

One lever control

For all ordinary riding especially in Traffic.

Extra air lever

is there if you fancy it.

You can shut throttle and jets off down hill and open air lever and scavenge your engine with

COOL, CLEAN AIR,

and obtain good air brake.

You cannot do this with any other.

The results given by this new and wonderful instrument have to be seen by most to be believed. No other carburetter can approach it for slow running and flexibility and utmost speed, and it is by far the most economical carburetter in the world. Makes any engine tick over dead slow like a steam engine, and pull dead slow in traffic, and won't race when clutch is taken out, when running slow.

The JET DAMPING SYSTEM—The Secret of the extreme economy.
The VARIABLE CHOKE TUBES—The Secret of the marvellous flexibility.

ON 3½ TRIUMPHS

AND ALL SIMILAR MACHINES

150 MILES PER GALLON.

DISPATCH RIDERS

are now fitting these Carburetters to their machines as they enable them to run much quieter. No "bangs" or racing engines, and much greater mileage.

If you wish to distinguish yourself you have a much better chance if your machine has one of these carburetters.

THEY ARE RECOMMENDED BY THE MILITARY AUTHORITIES AS THEY MAKE THE ENGINE START INSTANTLY and RUN FASTER. Both points of VITAL IMPORTANCE IN WAR.

Mr. O'Donovan gets over 81 miles per hour out of his 3½ h.p. single Norton.

On the SCOTT

This instrument practically makes this truly magnificent machine run with steam engine like flexibility, absolutely dead slow when free or in traffic, gives it the *easiest* start, and the extreme speed possible, yet with less petrol consumption than any other, and does not race when clutch is taken out. I have hundreds of wonderful testimonials about my this year's carburetter on Scotts' but the new instrument is a *startling improvement* on this year's, giving far slower running and 25% more mileage. Can be fitted to the Scott, when the old carburetter is removed, by a novice in half an hour, with a spanner only. Absolutely no alteration or work required. To enable you to *TEST* my claims, and compare this instrument with others, I will send you one on a week's approval and *TRIAL*, and if you do not like it I will return your money. The Scott set consists of Carburetter, 49/-, new petrol pipe, connecting stirrup, clamp, bracket, and engine shields, to make all look neat and workmanlike, 15--

READ LETTER IN "THE MOTOR CYCLE" ON AUGUST 21st, 1913, PAGE 1091, FROM R. F. G. KELLY, ESQ.

Testimonial (quite unsolicited) from Rev. O. D. Bruce-Payne.

St. Christopher's, Sandwich, Kent,
23rd September, 1913.

C. Binks, Ltd.

Dear Sirs,—I have just finished 500 miles with your latest pattern carburetter fitted to my Scott. First, with regard to the fitting—if accessibility counts for anything it is admirable. Your carburetter went on without any tool being needed beyond a small spanner. It is the most **delightful** instrument in use. In conjunction with a Scott, traffic, originally a nightmare with a one jet carburetter (automatic), which needed the united control of both hands and both feet, has no terrors, I can safely say, with a Binks two-jet. The extra air lever as a brake is especially useful.

Yours sincerely,
O. D. BRUCE-PAYNE.

Don't be put off by those makers who have contracted to fit cheap carburetters to all their 1914 machines.

Send for Lists and Treatise on Carburation.

C. BINKS, LTD., PHOENIX WORKS, ECCLES, Nr. MANCHESTER.

In answering this advertisement it is desirable to mention "The Motor Cycle." B27

Cams for Speed Work.

With standard timing I can do about 48 m.p.h., geared 4¼ to 1, on my 3½ h.p. single-cylinder. Is there any different valve timing and magneto timing for speed? What timing do you recommend for hill-climbing? If there is a different timing, and do manufacturers supply special cams?—H.A.

For ultra-high speed work it is certainly necessary to have a different valve and ignition timing. As a rule, for high speed work overlap of the valves is necessary. It is impossible for you to alter the timing, of course, unless you have new cams, but in all probability the makers would supply you with them if you wanted them. At the same time, when you have adopted such a timing you will not be able to throttle down, and the machine would be extremely uncomfortable for touring. You had better consult the makers as to the best timing for hill-climbing, as it varies so much with different engines.

Taking Driving Lessons.

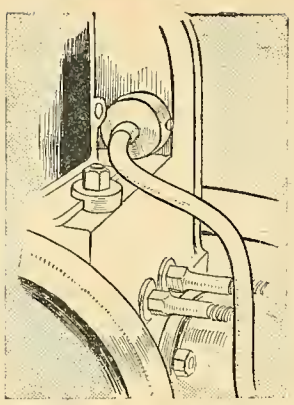
A local motor agent has a Morgan runabout which he uses for his business, trials, etc., and he has offered to give me some driving lessons on this machine, not necessarily with a view to my purchasing a machine, but because I said I should like a few. What would be a reasonable amount to pay for tuition? Four or five miles would have to be covered simply to get to a suitable road, both out and home. Is there much risk of a novice damaging a Morgan, and should I require a driving licence?—P.S.T.

We are afraid we cannot give you any set price for the lessons, and would advise you to try and come to some satisfactory arrangement with the agent. A usual fee for a course of lessons in driving a car is four guineas, but we do not think it would be so much in your case. The agent would certainly have to take the risk of your damaging the machine, but we do not think you could harm it in any way other than by running into anything. You would require a driving licence.

Chancery Lane to the Peak.

Will you kindly advise me which is the best route from Chancery Lane, London, to Bradwell—a village in the Peak District—and also give me an idea of the distance? My mount is a 3½ h.p. three-speed Humber, ridden solo, so that there is not any necessity to go out of my way to avoid hills.—B.J.M.

If you are going from Chancery Lane we should advise you to go through Holborn, Oxford Street, Baker Street, Park Road, to Finchley Road, which follow right through to Barnet, then continue through St. Albans, Dunstable, Fenny Stratford, Stony Stratford, Towcester, Weedon, Daventry, along Watling Street until you reach the turning to Hinckley, then go through Hinckley, Ashby-de-la-Zouch, Derby, Matlock, Baslow, Eyam, Hucklow, Bradwell. The distance would be approximately 150 miles.

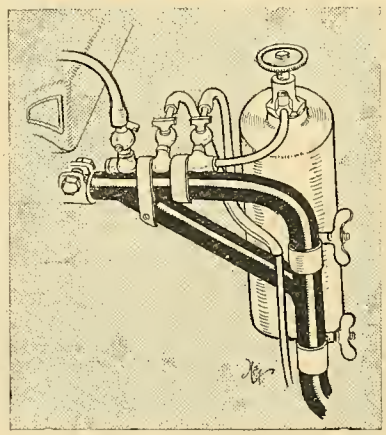


Release valve and pipe from crank case, conducting waste oil away to the ground, as adopted on the 3½ h.p. horizontal twin Brough.

Persistent Overheating.

I have a 3½ h.p. 1912 F.E. single-geared machine which has lately taken to knocking terribly. I have removed the cylinder and cleaned the carbon off, and fitted new rings. The carburetter is perfectly clean, and the bearings seem to be right. I am using a good thick oil, but all the same the engine, crank case, and carburetter get very hot after running about five or six miles. I use a medium gear, and the engine knocks in whatever place I put the magneto lever.—W.S.

We would suggest that you should try a new plug, as the points of the one you have at the present moment are probably burnt away and become so thin that the heat of the exploded charge renders them incandescent and so causes violent pre-ignition. We think you were quite right in fitting new piston rings, as it appears that blowing back is taking place into the crank case; consequently the heating you complain of is the result. You might also verify the timing, which possibly may have slipped.



Method of carrying a D.A. cylinder, noticed on a 6 h.p. Bradbury sidecar, showing arrangement of taps for front, sidecar, and rear lights.

Incorrect Belt Line.

I am building a motor cycle with a 2½in. belt line and 1in. belt. I ordered a new rear wheel with pulley to this belt line, but on receiving it I find the belt line is 2 1/32in.—that is, 5/16in. too much. Should I use this wheel as it is, or have it rebuilt to correct belt line?—H.M.

It will be impossible to run the belt so much out of line with satisfactory results. As you suggest, it would certainly be better if you had the wheel rebuilt in order to suit the position of the pulley of the engine.

Loss of Power and Weak Springs.

Until recently my engine a 2¾ single-cylinder, was running very well, when it quite suddenly lost all power on hills, and now I can seldom get it to do more than about 17 m.p.h. Occasionally it will accelerate up to about 35 m.p.h., but of its own accord it slows down after about two miles. I have tested the petrol level, compression when hot, and all joints for air leaks, but find all in perfect order. I presume the magneto is in order, as I never get a misfire?—J.P.

It will probably be necessary for you to renew the valve springs, as these have probably been in use some time and lost their temper and springiness. We cannot think of any other cause, as you seem to have gone through most of the things and found them to be correct. There is just a chance, however, that you are not getting sufficient lift on the valve, through wear on either the tappets or cams. If adjustment is provided this point can easily be seen to, but if not you will require a collar or thimble on the tappet to provide against the wear, but great care to get the right thickness for adjustment must be observed.

READER'S REPLY

A Trip to France.

My experience will be of interest to "J.L.," who wrote in your July 30th issue *re* a trip to France. In 1911 I went to Paris by Southampton-Havre with a sidecar and passenger. At Paris we were joined by a third person and went to Tours by train with the motor cycle. Two of us came back direct from Tours to Havre by road *viâ* Chartres and Rouen. Now the transport of the motor cycle and sidecar from Paris to Tours in the passenger train only cost us five francs. There were no formalities or previous notice necessary, and we did not even detach the sidecar. I should suggest to "J.L." that he should travel with his cycle on the train from, say, Vernon or Mantes into Paris, as he will find the cycle useful inside Paris itself, where the roads are not very bad. He could similarly travel by train for the first thirty to fifty miles out of Paris again. I have been twice to Paris this year with a car, and can say that the Havre route gives far the pleasantest road journey, and that the road between Vernon and Mantes has been largely repaired. The sea transport of the motor cycle and sidecar detached cost 10s., and the Customs only sixty centimes. These prices, however, may have been altered.—P. AND M. RIDER.

SERVICE SERVICE is ACTIVE SERVICE

In the full sense of the word. It is complete and up-to-date, and everything possible is done to thoroughly satisfy a customer. For instance, when purchasing a **SECOND-HAND MOTOR CYCLE**, we give you a **GUARANTEE** that the machine is overhauled and in **GOOD ORDER.** We can also **ARRANGE** the purchase by our **SYSTEM OF EASY EXTENDED PAYMENTS.** Please look down the following list. We are almost sure you will find a machine to suit, but in case you do not, we hope you will let us know exactly what you require, so that we can send particulars of any further machines we may have come in.

Save Expense.

If you feel you cannot afford new tyres just now, get out your old tyre covers and send them to us to be retreaded in the Beldam way.

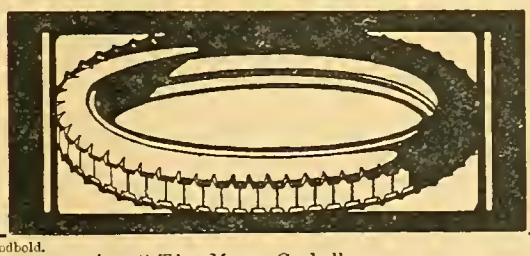
Beldam —Retreads

save you much money, last longer than some new covers. They are famous for the long life and satisfaction they give. On receipt of covers we will quote you. A very satisfied user writes:

"I was very pleased with the last cover you did for me. It outlasted the bike."

C.L.H.

The Beldam Tyre Co., Ltd., Brentford, Middx.



Godbold.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Son: Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

MOTOR CYCLISTS

AND THE

WAR.

THE NEED OF TO-DAY:
COOL HEADS &
COOL ENGINES.

The motor cyclist desirous of getting the very last bit of service out of his engine without running it to ruin must use the

NEW CHEMICO MOTOR CYCLE OIL

It keeps the engine as cool as a cucumber.

Obviates every tendency to gum up.

Admits of starting-up from cold without the use of injections.

Gives vastly greater mileage.

No power wastage.

Lessens wear and tear, etc.

Let us send you copies of testimonials received, expressing astonishment at improved running.

Ask your dealer to supply. If he can't or won't, we will, and pay carriage.

Quarts 1/9 ½-Galls. 2/9

Gallons 5/-

5-Gall. Drums 3/9 Per Gallon.

KEEP COOL,
KEEP THE ENGINE COOL,
AND WIN.

ELITE Rubber Co., 260, Coldharbour Lane, Brixton, S.W. 'Phone: Brixton 2042.—We have the follow'ng special clearance lines in motor cycle covers, belts, tubes, etc., and are offering same at prices equal to 33⅓ to 50% off the manufacturers' retail list price. All goods willingly sent on 7 days' approval against cash. These goods are all perfectly new, and in the event of any article proving unsatisfactory we are quite prepared to reasonably meet our customers by way of replacement. All goods sent carriage forward unless postage sent with order.

ELITE Offer 3/- Patchquick Outfit free of charge to all purchasers of goods to the value of £1 and over.

ELITE.—Send for price list, together with free sample of Elite Sticktight patches.

ELITE.—Kempshall clearance heavy grooved covers, 750×75 or 28×3, to suit 1914 Indians, perfectly new and fully guaranteed; 37/6.

ELITE.—Kempshall clearance covers, heavy non-skid, 26×2¼ 37/6 (list price 45/-), 26×2½ 40/- (list price 50/-), 650×65 45/- (list price 67/6).

ELITE.—Kempshall clearance covers, heavy anti-skid, 26×2¼, 24/6 (list price 32/6); 28×3 at 35/- (list price 57/6).

ELITE.—Henley oversize covers, 700×80, to fit 650×65 rims, heavy plain tread; 28/6.

ELITE.—Avon 3-ribbed covers, special heavy, 650×65, 24/- (list price 34/-); Clincher fluted pattern, 22/6; Heoley steel-studded, 40/-.

ELITE.—Heavy Three Spires covers, 26×2¼, B.E., 15/- (list price 27/6).

ELITE.—Midland heavy ribbed and studded covers, special clearance line guaranteed for 3,000 miles, 26×2¼ 25/- (list price 37/6), 26×2½ 27/6 (list price 40/-).

ELITE.—Hutchinson Brooklands, 1913 stock, 26×2 12/-, T.T. 26×2½ 16/6 (list price 33/6).

ELITE.—Hutchinson Passenger covers, 1913 stock, 26×2½ 22/6 (list price 41/3), 26×3 to fit 2½ rims 26/- (list price 44/-).

ELITE.—Hutchinson covers, wired on, Passenger 26×2¼ 20/-, 26×2 18/6, T.T. 26×2¼ 18/6.

ELITE.—Hutchinson small car covers, 650×75, to suit 650×65 rims, 25/- (list price 39/5).

ELITE.—Continental T.T. covers, 26×2¼ 19/6 (list price 28/-).

ELITE.—Michelin clearance covers, beaded edge 26×2 light 8/9, 26×2½ 13/9; Trideet, 26×2¼ 22/-, 26×2½ 24/-; Standard, 26×2¼ 22/6, 26×2½ 24/6.

ELITE.—Clearance Michelin covers, wired on, Semelle 26×2½ 32/-, Standard 26×2½ 26/-, 26×2¼ 24/6

ELITE.—Clincher heavy rubber studded covers, 26×2¼ 17/6 (list price 34/-).

ELITE.—Dunlop heavy rubber studded covers, 26×2¼ 17/6 (list price 30/-), old 1913 stock.

ELITE.—Special heavy rubber studded covers, suitable for back wheel of 3½h.p. machines; 15/-.

ELITE.—Clincher 700×80 covers, plain tread 21/6, heavy grooved 25/-; Clincher tubes, 700×80, 6/6, suit 650×65 rims.

ELITE.—Clincher extra heavy tubes, best quality, 26×2¼ 6/6.

ELITE.—Best quality tubes, fully guaranteed, 26×2 5/-, 26×2¼ 5/6, 26×2½ 6/-, 26× 3 7/6, butted 1/3 extra.

ELITE offer 15% allowance off retail list price for old covers (above clearance lines excepted); all makes in stock.

ELITE.—Motor cycle covers re-treaded by special process; treads guaranteed not to come loose; special heavy 15/-, heavy 12/6, medium 10/-; sections on application.

ELITE.—It is impossible for us to advertise all the special lines which we have in stock; therefore, if there is anything you require which is not mentioned in our advertisement, we shall be pleased to quote you upon receipt of a postcard.

Hub and Counter-shaft Gears.

NOW that the most strenuous and important annual trials in Great Britain are over, it is interesting to reopen the rather old controversy of "Hub *v.* Counter-shaft Gears" and endeavour to point to lessons in the light of the most recent knowledge of this much discussed subject. Without a doubt, the counter-shaft gear is steadily growing in public favour, and, as far as one can see at the moment, is the gear of the future. Its advantages are that it is much more simple in construction and has infinitely fewer parts to become deranged and require attention. These parts can also be made larger and more accessible than in the case of the hub gear. It allows of better weight distribution, and brings the kick-starter into a more convenient position. It dispenses with the long gear and clutch control rods, allows of larger diameter clutches, and involves a two step drive either by chain and belt, or by chain throughout. The rear wheel, being free of complication, is lighter and can be readily dropped out of the frame for tyre repairs. All these points are of some importance, and are well worthy of consideration, but we must not forget what the hub gear has done for the motor cycle movement.

Firstly, in conjunction with the influence of *The Motor Cycle*, it was, years ago, the means of bringing the variably geared machine into public favour, and, up till recent times, has been almost the only satisfactory three-speed gear capable of being fitted to existing pattern motor cycles.

Secondly, it is extremely neat and compact, and has given extraordinarily good results considering its size and weight; and, thirdly, it is probably the quietest form of motor cycle gear in existence, excluding, of course, the variable pulley type; and, fourthly, changing gear, up or down, at any speed is a matter of the greatest ease. The hub gear is considerably lighter than most three-speed counter-shaft boxes, and for this reason it is bound to remain with us for a certain type of motor cycle; but, unfortunately, this weight is in the wrong place, and even an expert will take considerably longer to change a tyre if a hub gear be fitted. It has one other disadvantage which, though slight, carries considerable weight with most motor cyclists, who are almost invariably their own mechanics, and that is, that it renders the back wheel very difficult to clean.

What the Hub Gear has Done.

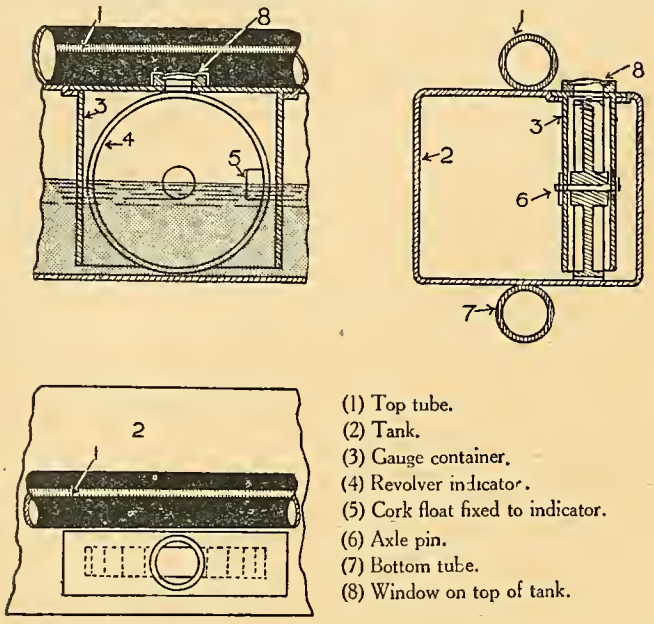
UNDOUBTEDLY, motor cyclists have to thank the three-speed hub gear for the impetus it gave to the motor cycle movement. Three or four years ago, two-speed counter-shaft gears existed in plenty, but the striking successes of three-speed hub gears in the T.T. races and trials of 1911 set every designer plotting out a multiplication of speeds, and now three or four-speed gears, no matter whether of the hub or counter-shaft type, promise to come into popular favour in 1915. Everything points to a multiplication of gear ratios, for the big trials have demonstrated in no unmistakable manner that at least three speeds are necessary for a 20 m.p.h. average over difficult courses, and we have the striking success of three-speed mounts in the A.C.U. Six Days Trial (the most severe trial ever run) still fresh in our memories.

The great and still growing popularity of the sidecar is undoubtedly primarily due to the hub gear. Thousands of owners, unable to afford a new turn-out, have, at moderate cost, been able to convert their old single-speed mounts into satisfactory passenger-carrying machines, and to this fact alone the hub gear will always lay many motor cyclists under an eternal debt of obligation.

No one can say what the future will bring, but probably the combined engine and gear unit will be the next development, for, in spite of certain manufacturing difficulties, it has many advantages from the rider's point of view

A Novel Petrol Gauge.

COMPLAINTS are not infrequently made about "petrol gauges that don't gauge," but the latest I have tested is apparently proof against all the weaknesses which have worried me in the past. It cannot suffer accidental damage or leak. It is always instantaneously legible from the saddle, and its readings are extraordinarily accurate. My enthusiasm about it is tempered only by a single anxiety, for its design rather complicates the question of fitting, and may render tank makers somewhat loth to adopt it. The sketches make its principles perfectly clear. A very light ring of metal is hung on a spindle suitably supported by vertical carrier arms inside the tank. The ring is of such a diameter that it just clears the top and the bottom of the tank, in which it is set longitudinally. At a point of the circumference of the ring a cork float is suspended; this cork float falls with the level of the petrol, as the spirit is drawn off, and so causes the ring to revolve. As the ring revolves, its face shows through a small transparent window mounted in the top of the tank, and the face of the ring is painted with indications of the petrol level, either in fractions of a gallon, or "three-quarters," "half," "empty," and the like. The gauge functions with extraordinarily fine accuracy, and its sole defect consists in the difficulty of fitting; for either the gauge must be inserted before the main seams of the tank are closed, or, alternatively, a longitudinal slot must be cut in the tank for its insertion. The length of such a slot must be about equal to the depth of the tank, and would, therefore, range from 4in. to 6in., according to the size of the tank. Enquiries should be addressed to Mr. Forrest Baird 15, East Park Avenue, Hull. ROAD RIDER.



(1) Top tube.
(2) Tank.
(3) Gauge container.
(4) Revolver indicator.
(5) Cork float fixed to indicator.
(6) Axle pin.
(7) Bottom tube.
(8) Window on top of tank.

The float rises or falls as the level of the liquid varies, thus causing indicator to revolve. Graduations are marked on the periphery of the indicator, and are seen through the window of the tank.

350 c.c. Sidecar Records Broken.

ATTACKS were made recently on the 350 c.c. sidecar records by H. Alan Rhodes and T. B. Haddock, both driving a 2¾ h.p. A.J.S. and N.S.C. sidecar with 10 stone passengers. The former opened proceedings by attacking the 350 c.c. sidecar flying kilometre, flying mile, and flying five miles records, all of which fell fairly easily. The results of his efforts will be seen by comparing the old and new records which are as follows:

	New Record.	Previous Record.
	H. A. Rhodes (2¾ single-cyl. A.J.S. sc.)	A. C. Starace (2¾ twin-cyl. N.S.U. sc.)
Flying km. ..	42⅘s. = 52.27 m.p.h.	43⅘s. = 51.07 m.p.h.
Flying mile ...	1m. 11s. = 50.70 m.p.h.	1m. 12⅖s. = 49.72 m.p.h.
Flying 5 miles	6m. 26⅘s. = 46.60 m.p.h.	7m. 2⅖s. = 42.57 m.p.h.

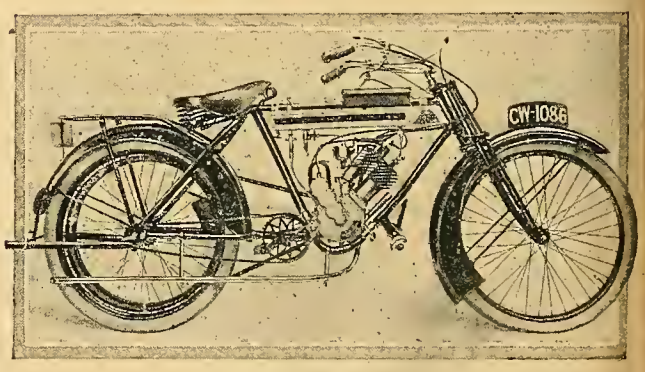
The next attempt was that of T. B. Haddock on the one hour 350 c.c. sidecar record, riding the identical machine used by Rhodes. *En route* he beat the standing ten miles record in this class, and almost up to the end of the hour was lapping regularly at an average of 42½ m.p.h., when he unluckily suffered from trouble through the petrol pipe bursting, which reduced the average to 41.43 m.p.h. for the sixty minutes. This beat the previous record by nearly a mile, as will be seen from the following table:

	New Record. T. B. Haddock (2¾ single-cyl. A.J.S. sc.) m.p.h.	Previous Record. 10 miles.—A. C. Starace (2¾ twin-cyl. N.S.U. sc.) 1 hour.—H. V. Colver (2¾ twin-cyl. Enfield sc.) m.p.h.
Standing 10 miles	14m. 6s. = 42.55	14m. 20s. = 41.82
1 hour	41 miles 757 yds. = 41.43	40 miles 988 yds. = 40.56

The A.J.S. machine was fitted, as stated above, with N.S.C. sidecar, and H. A. Rhodes used Avon tyres, Pratt's spirit, Castrol oil, U.H. magneto, and an Amac carburetter, while T. B. Haddock exchanged the Amac for a Senspray and used Chemico oil.

A WELL-DESIGNED LIGHTWEIGHT.

A remarkably cheap but well-finished lightweight is being marketed by the Moto-Rêve Co., Ltd., Alperton, Middlesex, known as the Alp. A 2 h.p. four-stroke engine of 62 × 85 mm. bore and stroke, 257 c.c., with overhead inlet valve, supplies the driving power through a Wata-Wata belt. 26in. × 2in. Hutchinsons, Druid forks, and magneto ignition are used, and the general outfit of the little machine, which scales 106 lb., is quite excellent.



The Alp lightweight motor bicycle.

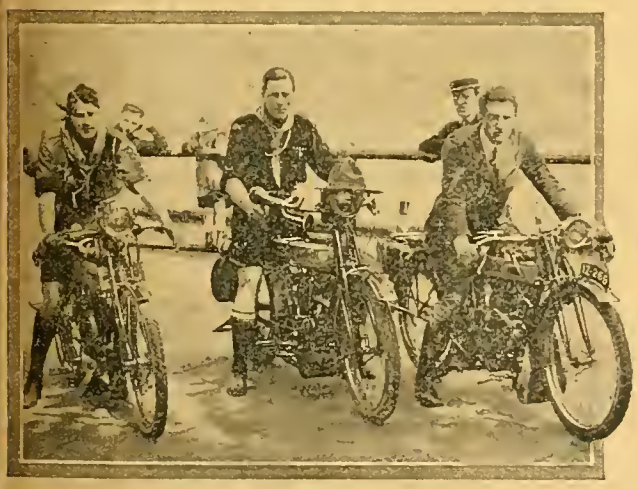
OCCASIONAL COMMENTS
by "IXION"

Stop when Challenged!

I am not very keen on night riding, though dissolved acetylene has rendered me far more disposed towards ourneys in darkness than I used to be. Anyhow, he last fortnight has made me particularly wary in wo respects; I always carry my licence with me, and, when challenged, I perform lightning stops, which would gain my brakes a 100% award from friend Loughborough in any A.C.U. test. My first experience came soon after the outbreak of war. I was peacefully scrapping at my normal night pace of—[Illegal matter deleted.—ED.]—up a little hill leading out of a neighbouring village when I fancied I beheld the village idiot dancing the cancan just under my front tyre. Fortunately my lamp was burning well, and I recognised the village policeman, further perceiving that he had something hard and shiny in his hand! I do not know how much fact underlies this spy mania, but without question it is well to stop promptly at night when anybody from a Boy Scout to an apparently inebriated tramp challenges us.

The Sporting Craze.

I read some very scathing remarks on the craze for all that smacks of Brooklands, beginning with the leather racing helmet and terminating with the streamline two-seater and cigar tail type of cycle car body. The scribe in question resurrected contemptuous memories of the early cycling days when G. P. Mills was the most famous man in England, and all the dashing youth of the day might be seen pedalling furiously abaft two handles curled downwards like a ram's horns. The prophet in question regarded all our speed poses and practices as a species of mild insanity, indicative of extreme youth, morally identifiable with swank and hypocrisy of the worst type, etc., etc., I wonder! The most enthusiastic devotee of the racing cap in my acquaintance swears by its *comfort;* and the most devoted adherent of the cycle car *type sportive* treasures it for the fast climbing which its bantam-weight body renders possible. I am not sure that we are either as bad or as silly as some of our critics imagine. Anyhow, I am all agog for a new type of cycle car body, which is reported to be made of starched canvas, and to weigh no more than an 880 × 135 mm. inner tube; but I am interested because I know my tiny engines feel every ounce of weight uphill—not because I want Miss Gladys Smithers lounging on the front at Eastbourne, to mistake me for Kenelm Lee Guinness or "Big Benz" Hornsted.



THE SPECIAL CONSTABULARY FORCE.

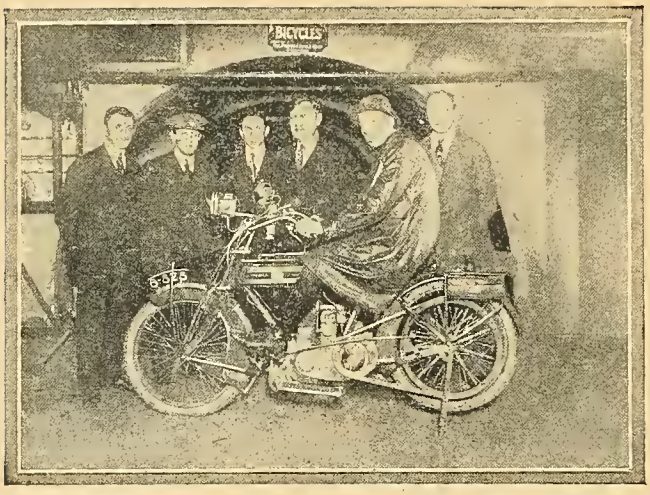
The two Scoutmasters on the left of the picture have been doing excellent work ever since the new force has been started. During the first few days they answered all queries and carried out their duties with tact, civility, and promptitude. The machines are (left to right) a Triumph, a Rudge, and a Douglas.

The Price of Petrol.

As I write the Shell and Pratt people have announced their intention of maintaining the usual prices, but the unfortunate provincial distributers are in some cases unable to replenish their supplies, as the goods trains are disorganised, and the heavy motor lorries have mostly been commandeered for military purposes. Once more the motor cyclist scores. In a cross-country provincial run I made a point of asking the price of petrol at every centre, and was quoted prices ranging from 4s. to 10s. a gallon, the exact figure being determined simply and solely by each agent's stock. In many cases the vendor insisted on verifying the amount in my tank, and expressed himself unable to supply more than the minimum quantity essential to carry me to the next town. I must make a 600 mile journey next week, and I had intended to tackle it on a cycle car, which runs 35 m.p.g., but now I shall take a motor bicycle instead, and do 110 m.p.g. There is plenty of petrol in the country, and one cannot refrain from congratulating the big suppliers for their foresight.

Dissolved Acetylene—its One Defect.

My last note on these handy cylinders provoked a few letters, with which I hasten to deal. The sole defect of the system is that one may occasionally have to sacrifice a few pennyworth of gas, as a cylinder may be just short of being exhausted when the user is starting on a long night ride, for which he may desire to have a stock of several cubic feet; for no allowance is made on any residuum in the cylinder when it is exchanged. The motor cycle size holds six cubic feet of gas, which is accurately measured, and will supply one standard head lamp burner of the normal ¼ft. size (*i.e.*, passing a quarter of a cubic foot per hour) for twenty-four hours, or two such burners for twelve hours. The cylinders never fail till their time is up, and the gauge provided with them is a



MOTOR CYCLE COMPETITION ONE DAY, WAR THE NEXT.

This illustration shows Mr. Veringa, a Dutch motor cyclist, who rode from Amsterdam to Brussels and back in competition for the Premier Cup in 15 hrs. 11 min. on his 3½ h.p. Premier. The day after he had achieved this run, he was called up as a military motor cyclist to the Dutch Army. He passed through Tirlemont, Louvain, and Liége, scenes a few days later of fierce fighting. The second figure from the left is Mr. A. Citroen, hon. sec. of the Dutch M.C.C.

reliable index of the contents. The price works out at 1¼d. per burner per hour, which is just fractionally more expensive than lump carbide used in a generator. But the infinitesimal extravagance is really an economy, for no time is spent in cleaning, no mishaps ever happen by the roadside, no burners are ever fouled or choked, and no lenses are ever damaged by tangent spirts of flame. Beware of fitting the cylinder and connecting tube in such positions that the rider may accidentally pinch the tube and suddenly plunge himself into Cimmerian darkness at high speed. I fastened my first cylinder (two years ago) to the saddle-pillar tube, and ran a light rubber pipe along the tank top to the head lamp. It slipped off the tank top one dark night, and at the next corner my famous "leaning out knee grip" pinched the pipe flat and put the light out—Gee whizz!

The Luxurious Twin—Some Protests.

I am seldom accused of fulsome pandering to the trade, but my panegyric of the modern high-powered twin bicycle de luxe, as compared with costly and comfortable touring cars, evoked quite a little volley of protests. My judgment felt so impeached that I repeated my tests, and respected my correspondents sufficiently to take a high-powered twin and a very select and comfortable car twice over the same stretch of rather indifferent road. As the result of the renewed tests I am perfectly game to stick to my guns. The big twin bicycle was unquestionably more immune from road vibration and more silent at a speed of from twenty to twenty-five miles an hour. When the pace was increased to thirty or thirty-five miles an hour, the cycle engine made more noise than the car engine, but did not communicate more vibration to my person, while the bicycle remained the more comfortable mount of the two. I can only suppose that my indignant correspondents either lack experience of a first-rate bicycle, or that their ideas of a good car on poorish roads are garnered from the pages of a catalogue rather than from actual contact with its cushions. My remarks were perfectly *bonâ-fide*, and I am ready to stick to them in the teeth of all and sundry. Here is another remark which may excite some pugnacious readers. I would rather drive a 500 c.c. single motor bicycle 200 or 300 miles in the day than the best car ever made. On the other hand, I admit it is less fatiguing to be an idle passenger in a first-rate car for that distance than to drive a motor cycle over it.

An Alternative Storm Kit.

One of our readers—a well-known long distance rider—sends us an account of his own bad weather kit, as a counterblast to "Road Rider's" recommendations (page 178, issue of August 6th). It consists of the following:

1. Hutchinson waders.
2. Fox's spiral puttees.
3. Moffat's oilskin poncho.
4. Continental riding gloves.
5. Leather racing helmet.

A practised eye will perceive at once that this outfit will cost more than twice as much as "Road Rider's," and will be infinitely more difficult to put on and take off. In other words, it is probably a better outfit than "Road Rider's" for the athletic nut who makes longish non-stop runs, puts up at hotels, glories in his freakish appearance, and does not mind what he pays for his outfit. But the athletic nut is really rather a rare bird, and the rank and file of motor cyclists desire a cheap outfit, which will keep them reasonably dry, and which can readily be removed and replaced after a short business or other call. I attended a discussion on motor cycling garments at the quarters of a provincial club not so very long ago, and this quite typical club did not appear to contain a single member who used the full costly "nut-kit" as described above; on the other hand, if the B.M.C.R.C. held a winter symposium on kit, I expect a good 75% of its membership would vote for the nut-kit. Even in a six days trial, a stormy day brings out very few of the above garments, simply because they are bulky and awkward to get into and out of. They form an admirable equipment for the home base, to use a topical term; but they are comparatively uncommon because of their cost, the labour required to put them on, and the fact that they are so heavy and hot when the storm is over. Any winter rider who can afford two separate kits should certainly have a nut-kit in reserve for his worst rides. I append my personal protest that I dislike the leather racing helmet; I had one specially made for me, which fits splendidly; but it is weighty, and does not protect the eyes.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

MOTORS AND MOBILISATION.

Some Sidelights on their Many-sided Utility in Time of War.

BY OUR EAST COAST CORRESPONDENT.

THIS is the first European war in which the motor has figured largely in the operations. In our own country thousands of cars and cycles have been pressed into the service of the military authorities, and their usefulness in a hundred different ways makes some of us wonder how the Army managed in the days when the horse was the quickest means of road travel. For conveying messages, for the rapid transport of men and material, for enabling officers to flit from point to point at almost express speed, the car and the motor cycle have been invaluable, and have proved that, in addition to recreation and trade, there is a third and perhaps greater avenue in which their usefulness may be invoked for the national good.

Military Motoring on the East Coast.

I have just returned from a business trip along the East Coast. In the circumstances of the present war this is one of the most acute danger points in England. It is not for me to say how it is guarded, to say where this battalion is encamped or the other, or even to give any general picture of the enormous activity which prevails along the entire seaboard of the eastern coast, but I may be permitted to say that in this vast scheme of mobilisation, when almost an entire nation has sprung to arms, not the least important feature of it is the part played by the motor. Thousands of motors, from the taxi of uncertain age to the latest Rolls-Royce, have been pressed into service, and high roads and by-lanes, big cities and sleepy coast towns, have throbbed and hummed with the constant passage of cars and cycles—first a messenger scorching along in soulful glee at the suspension of the speed limit, then a car load of stern-faced general officers, then another carrying an armed picket to some point, then a heavy rumbling waggon heaped high with army stores. The drivers seemed thoroughly to have enjoyed their experiences, and when the war is over they will have some rare tales to unfold

The Rough with the Smooth

The work is harassing, but it has its compensations—the halt in a peaceful country town, the hold-up in some village school where the youngsters have been released and now stand on the pavement in wide-eyed wonder at the things they but dimly understand, the refreshing sleep in the open air waiting for a general staff officer to indite his despatch reply to the letter he has just received. Sometimes there are interludes at the seaside, and time for a bathe, and then again there have been chats in the village inn where the yokels gather round and look upon the riders as though they had come straight from the fighting at the front. Everywhere we have been received with kindness, for now the nation is at war all who are even remotely connected with it are heroes in the public eye. Kindly women in the villages give us food, press parcels of vegetables upon us as we leave, and, in some cases, they have been known to take car drivers into village inns and pay for the best meal the house could provide.

Rigid Censorship of the Roads.

On the road the surveillance is rigid. Every pass is closely scrutinised, and, if there is the least doubt, the police hold the rider up whilst they telephone the town of origin and satisfy themselves. Then the pass is stamped and the messenger drives forward. The utility of the motor cycle was exemplified once when an adjutant received a telegram demanding a reply immediately from the colonel The colonel could not be found. He was some miles away. But the driver of a sidecar was sent after him and had him on the spot in half an hour. The services of motor cyclists have been requisitioned in another way, too—they have been told off to keep an eye open for any aircraft, and, as far as possible, not to let them out of observation. The military keep a close watch on all cars. Sentries guard the main approaches into important towns, and every car and cycle is stopped. In one case, where the call to "halt" was not obeyed with the needed alacrity, the front wheel of a Douglas came into contact with a bayonet, and when the rider protested the sentry laconically replied, "I suppose you have a foot brake!"

Of course, we all trust and believe that there will never be any sterner work for these riders and drivers to carry out, but whether that may come or not, there is little doubt that the value of the internal combustion engine in time of war has been fully proved, and motor cycles in particular have shown themselves singularly adapted for speed work on our narrow roads.

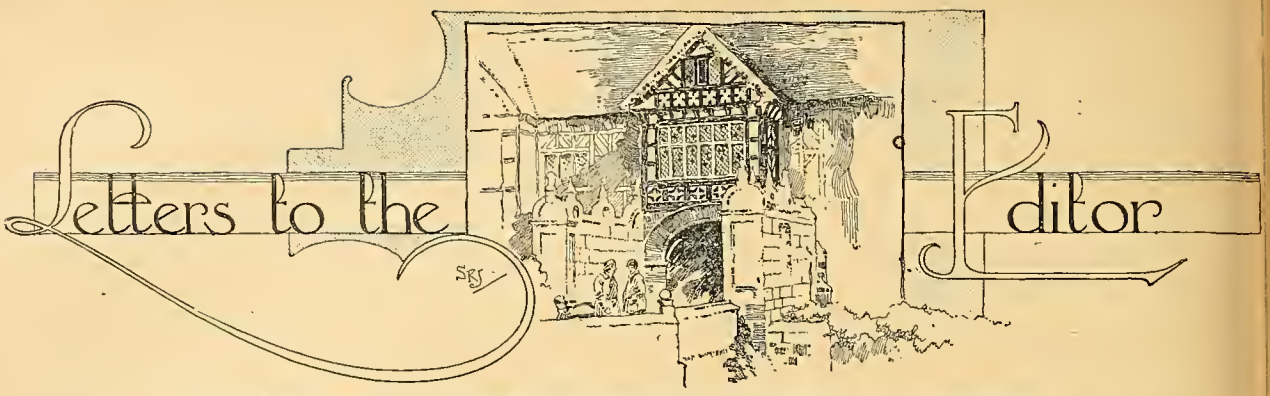
NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected matter will only be returned provided a stamped addressed envelope is enclosed for the purpose



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A Suggestion.

Sir,—Now that so many patriotic motorists are, I believe, running their motor cycles all the week in the service of their country, may I make a suggestion? Many who at present have to serve by standing and waiting can get away for the week-ends, and such men might give those who are at it all the week valuable relief and rest, if not now, possibly when the stress becomes greater. To the week-enders, too, open-air on work like this would be invigorating, and the training would be invaluable for further emergency.

REST AND BE THANKFUL.

A Freak Climb.

Sir,—I beg to inform you that I have climbed the freak hill near Todmorden, known as Naze Road, on a 6 h.p. Bradbury with sidecar and an eleven stone passenger, and I am informed that I am the first to accomplish this feat. I passed the white farm house and climbed for another quarter of a mile or thereabouts. I must say that, had I known the hill, I should not have attempted the climb, and have no intention of repeating it. After reaching the top I crossed the moor for a distance of about four miles and dropped down into Wardle. I had to lift the machine over boulders and cross two marshes. In passing a disused pit we overturned, fortunately without suffering any damage, and the machine stood the knocking about excellently. W.G.

The Price of Petrol.

Sir,—I think the following may be of interest to you and your readers.

I happened to be in Bournemouth on the occasion of my holiday on Tuesday, 4th inst., and was almost stranded for want of petrol. I called at at least a dozen garages to try and get some. In many places I was told that none had arrived, and in those places where they apparently had some the price asked was nothing short of extortionate, in spite of the fact that in the papers it was stated by one large petrol company that the price of petrol to the retailers had not risen.

Under the circumstances I think I was particularly fortunate in obtaining petrol of Messrs. A. G. H. Alsford, Palmerston Road, at usual prices. M. DEFATCH.

Retreading Tyres.

Sir,—I have read letters in your columns on the above subject, and I would like very much to say that I have had the same gratifying experience with the retreads carried out by Beldams, Ltd., but I think I can go one better, my machine being a 6 h.p. A.J.S. with tandem Montgomery sidecar, and the mileage the retread has done is nearly 4,000 and it is still good. I have yet to record a puncture. The tyre is on the front wheel and is a 650×65 Hutchinson. The cost was, if I remember correctly, 13s.

When one takes into consideration that few new tyres go much farther, and the great difference in cost between the two, I think one can safely say, "Vote for a Beldam retread and a light tyre bill." And this is not my first experience with retreads by this firm, having had two other covers done by the same process.

May I add the usual disclaimer? A.C.R.

Military Machines and Riders.

Sir,—I am an admirer and rider of a well-known opposed twin lightweight cycle. While in Bristol recently I saw a number of these new machines apparently taken over by the War Office, and ridden by members of the cyclist corps.

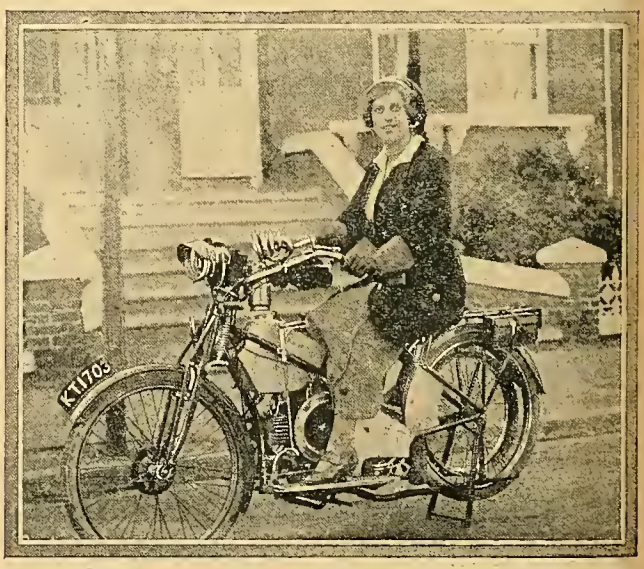
We are all looking forward to seeing our sporting little mounts being made practicable use of in this war, and, given proper care and decent riders, we feel sure this will be the case. My object in writing is to say that it seemed to me this body of cyclists knew very little about the machine in their control—their technical knowledge was very small indeed. The way in which they started off made one's heart ache for the little machine; they had no idea of the use of the clutch or how to change their gears, and would very soon ruin any machine. I hope these riders will realise this is not a joy ride, and that it is up to them speedily to acquire a knowledge of their machines, so that the whole corps shall be a credit to themselves and the country, and be of that use which we think they can be.

A WELLWISHER.

Petrol Consumption of Small Twins.

Sir,—I notice in *The Motor Cycle* that "Ixion" says that small twins are very heavy spirit consumers. I should like to tell you that I have a lady's 2¾ h.p. Douglas, and a short time ago I did 130 miles on a tankful (which holds just under a gallon) of benzole, and with petrol I obtain 120 miles to a tankful. I enclose photograph of myself and machine.

(MRS.) DORIS ROOTS.



Mrs. D. Roots on her 2¾ h.p. Lady's Douglas.

A Motor Cycle Ambulance.

Sir,—I am sending herewith two photographs showing how I have converted my James sidecar machine into an ambulance. The body is for carrying surgical appliances, first-aid requisites, etc., or can be used as a sidecar for a passenger. The runners are made to take the Army regulation size stretcher, which is much shorter than that used in the illustration.

An ambulance waggon takes four horses and two men, and carries four men lying down, and if they do forty miles in one day it would be good work. Four motor cycle ambulances could cover two hundred miles each in one day, thereby doing about five times the work. The idea originated when I used my sidecar as an ambulance eighteen months ago to take my little girl, who had broken her leg, to the hospital.

B. OLDHAM SMITH.

Teaching Rifle Shooting.

Sir,—I see on page 225 of *The Motor Cycle* of August 13th an article on "The Value of Short Range Rifle Practice."

I was glad to see it, and while I agree with much that the writer says, I would like to point out one or two little matters on which he, no doubt, will make no mistake, but those inexperienced in the use of high-class firearms may be deceived.

It has been my lot to act as instructor in musketry for the past few months to some 200 men. Many of these men are first-class shots with the airgun, yet I invariably find that an airgun man makes the very poorest attempt with a rifle.

They all have their own ideas of aiming and pulling the trigger, and no amount of talking will persuade them that a rifle is quite different from an airgun.

For instance, it is not nice to be asked by a man when he first goes to the butts, "Do you take a fine sight with this gun?" especially after one has spent weeks repeating the old tale with regard to aiming, "The tip of the fore sight to be level with and in the centre of the V of the back sight and in line with six o'clock on the bull's eye." I quite admit that all airgun men know what the sights are for, but that is about all. I have only met one who can understand that it is possible to take exactly the same sight with two different rifles and make good shooting with both.

To any person starting with airguns, I would suggest that the guns be rifled, fitted with military sights—not apertures or bead or other fancy sights—just the plain V back sight and a blade or barleycorn fore sight. Undo the trigger tension screw so as to give a heavy pull off of, say, 3 lb. or 4 lb.

My chief difficulty has always been to prevent airgun men used to the hair trigger employed in the "match" airgun from pulling off to the right when using a rifle with a heavier pull, such as the service rifle or the War Office Miniature.

A most useful instrument is an aim corrector. By means of it the instructor is able to tell exactly how the recruit is aiming.

To me twenty-five yards seems a very long range for an ordinary airgun if good and consistent shooting is to be done. I would suggest ten to fifteen yards as the longest, and even that is a long range.

For those who care to spend the money I would recommend the B.S.A. air rifle, which shoots very well up to about fifty yards, and has the advantage of being cheap to use.

If a gun more nearly approaching the service rifle is required, then I would recommend the B.S.A. War Office Miniature, .22 bore. This rifle has military action and sights, but is hardly heavy enough for my taste. It is not expensive to use, the ammunition costing only about twelve shillings per 1,000.

I may say that I am not in any way interested in the Birmingham Small Arms Co., but I know a good thing when I see it, and I do not think any better rifles are to be had for the price than those I mention.

I should apologise for writing such a letter to a motor cycling paper, but I think it wise to hand on my bitter experiences to one who is doing his best and who possibly has not had quite the same opportunities of learning.

HENRY HILL BROWNRIGG.

Sir,—I can, from my own experience, corroborate "Road Rider's" statement with reference to the value of practice with small rifles. When I was a youngster I spent most of my pocket money upon rook rifle cartridges, instead of wasting it on cigarettes, and spent a fair amount of time shooting at any kind of mark that presented itself, *e.g.*, rabbits, gulls and cormorants on the cliff, stones on the hillsides, and card targets with a little .350 Holland and Holland rifle. Then on going up to Oxford I joined the 'Varsity corps, and well remember my first attempt on the range. The first shot was below the target, and the sight was accordingly raised. The next was an outer low. Again the sight was raised, and the last five found the bull; this was at 500 yards. I do not for a moment suggest that this was remarkable, but I do think that it would have been beyond the power of anyone to whom any kind of rifle was entirely strange.

Later, I spent a good deal of time during one Easter

vacation practising at card targets with the same little rifle, and my first two shoots on returning to Oxford totalled 101 at 200, 500, and 600 yards out of 105, and 88 at 800 and 900 yards out of 100 This was immediately after the reduction in size of the targets, I think in 1890, and the shooting was done with a Martini.

I do not wish to advertise myself, and will, therefore, simply sign myself LIEUTENANT.

A Suggestion for Manufacturers.

Sir,—I think it would be a good idea for advertisers to give the addresses of their foreign and colonial agents. There are many accessories and machines which seem common enough in England, yet one never knows where one can procure them out here. We have no paper dealing with motor cycle matters, and I am sure if firms advertising in your paper would give the addresses of their foreign and colonial agents it would be greatly appreciated.

Inglewood, Victoria. AUSTRALIAN.

Colonial Roads.

Sir,—I note a few remarks contained in a letter from a correspondent "Eldon," in your issue of 7th May, inferring that Colonial writers do not know what bad roads are unless they have sampled the Bath Road through Brentford.

Now, as a Colonial motor cyclist of several years' experience, I would like to ask "Eldon" how he would like to have to traverse a main "road" for 150 miles without a yard of metal, chiefly through volcanic country composed of light pumice sand from three to twelve inches deep, and where the road is not sand it is composed of clay hillocks with potholes up to six feet deep. These latter are caused by the road breaking through into subterranean dry water courses, which mostly are unmarked, unless some earlier motorist in endeavouring to dodge disaster has ended up in the manuka scrub and has been thoughtful enough to insert a stake or a small manuka tree as a warning to others.

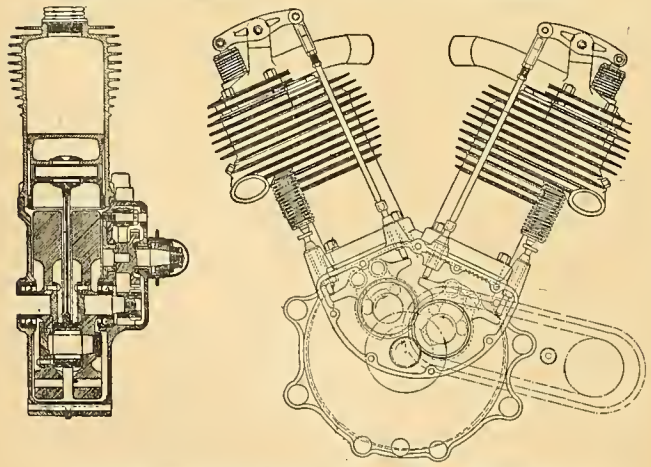
I would like to take "Eldon" on a "joy ride" from, say, Te Aroha to Napier *via* Lake Taupo on a nice dark night over the greater part of the road I mention, and if he brings the motor cycle that has broken nineteen spokes in four months I can guarantee he will break nineteen spokes every four minutes. For this reason he would require to take about ten spare wheels.

"Eldon's" mention of the broken spokes proves that he is either a very bad rider or has a very poor mount, and if the latter it proves what an amount of good a trial under Colonial conditions will do, in pointing out the weak parts of some of the machines that are expected to stand Colonial conditions.

I may mention that until lately I was continually on roads such as I have mentioned, riding a 3½ three-speed Singer, which, for the eight months I have used it, has not broken a single spoke, the only cost being two new fork springs, broken through getting into potholes in the dark.

In conclusion, I will add the usual disclaimer.

Hawera, New Zealand L. S. BARRELL.

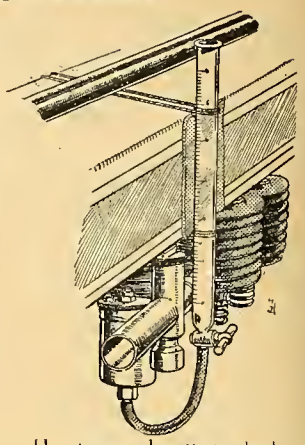


Sectional drawing of the new 7 h.p twin-cylinder Rudge, showing features of design This machine was described in our issue of July 2nd page 23

Petrol Measuring at Hill-climbs.

Sir,—In a recent issue of your paper I notice some interesting remarks on petrol measuring. In cases where it is required to measure the consumption for a small distance, such as a hill-climb, it is convenient to use a small glass burette. This can be tied on to each machine and a rubber pipe put through to the carburetter, which is flooded, the burette reading taken and then taken again at the end of the measured distance. With a little care quite sufficient accuracy is obtainable to render the results both interesting and valuable.

A. M. LOW, A.C.G.I.,
D.Sc., etc., etc.



How to use a burette to check petrol consumption.

T.T. Bars and Knee Grips.

Sir,—What's your opinion of T.T. bars, knee grips, etc., for ordinary riding—saying a man takes up motor cycling as he would horse riding or driving—as a means of getting about (only more so), and to see the country and do business visits. A young man of my acquaintance had a T.T. machine. It wasn't fast enough; he could only do fifty-five on the flat. His riding was ostensibly week-ends and holidays, but incidentally round the houses every evening and up and down suburban roads. The doctor has ordered him not to ride. He is now a wandering imbecile. Every motor he can get up against and driver he can speak to it's, "Ha! nice motor cycle, but you want low T.T. bars and some good knee grips, etc." "Youth will be served," but how is it you never see racehorses on the road galloping for all they are worth with their owners up? There is a place, etc. OLIVER JONES.

Magneto Eccentricity.

Sir,—The phenomenon of the magneto being switched off at full retard referred to recently is perhaps due to the magneto being equipped similarly to magnetos on 1912 Douglases, where this object is deliberately aimed at A slip of spring steel is fastened to the switch terminal on the contact breaker casing, so that when the casing is rotated to the "full retard" position the spring makes contact with the magneto body and shorts the current. This gives the additional method of stopping the engine by magneto switch, with the advantage that the switch cannot be closed with the magneto at full advance—a state of matters to be avoided, because if you slow down by switching off the engine continues pumping gas through it till the burnt inert gases are thoroughly scavenged out of the compression space and the cylinder is as full as possible of explosive mixture, which, exploded at full advance and a low speed, unduly strains the engine, and may produce a violent backfire or even blow off the cylinder. This danger is more pronounced when the engine is hot, because the heated charge burns so instantaneously as to produce an excessive initial pressure against a rising piston. After the piston has begun to descend the pressure falls rapidly with the expanding gas, and as with a reduction of pressure the rate of combustion also falls, the percussive effects of the explosion are much less on an ignition at full retard than on an ignition at full advance. Again, at low speeds the magneto gives a feebler spark at full retard than at full advance, and a feeble spark has a very distinct effect in setting up a slower combustion than that set up by a powerful spark. For these reasons it is obviously desirable that the magneto switch should only be used at full retard N.S.M.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street London, E.C.

Home from the War Zone.

Experiences of One of the Last Englishmen to Leave Stuttgart.

LAST week we received a call from Mr. C. W. Graham, an English motor cyclist not unknown to some of our readers, as he competed in occasional open competitions last year in the Midlands. Last January he went over to Stuttgart to a famous motor accessory works in which, up to the time of making a hurried departure recently, he was practising engineering. Mr. Graham was one of the last Englishmen out of Germany, and had reluctantly to leave his practically new Triumph motor bicycle, which was confiscated by the German authorities; but it was only by a stroke of bad luck that he was deprived of possession of his mount at the very last moment. Having regular employment in Stuttgart, he did not quit Germany on the proclamation of war, as tourists had done, though he was gradually deprived of his friends, who were called to the colours.

Ten of twelve personal friends left him to join the ranks. He told us that the news circulated in Germany was all favourable to the Kaiser's army, and the general public believed it faithfully. Indeed, Mr. Graham was not aware of the true state of affairs until he reached Switzerland on the way home, there to learn that the capture of Liège was a fable and other tales of successes woefully misleading. Mr. Graham told us of the change of attitude of the Germans on learning that England had declared war. Originally confident of the issue, German feelings changed to seriousness and anxiety when they learned of the British proclamation.

A Motor Bicycle as "Hand Luggage."

Mr. Graham's Triumph, which he had been using regularly right up to the time of his departure, carried the letters "G.B.," yet rider and machine had been unmolested in the neighbourhood of Stuttgart. Gradually, however, the authorities became more stringent, and Mr. Graham was advised by his personal friends to hide his machine to prevent the Germans commandeering it.

It was not until after the German Army had been completely mobilised that he was ordered to leave, accommodation being provided for an English party of about fifteen to travel *viâ* Friedrichshafen. No luggage was allowed, but Mr. Graham managed to get on the best side of two railway officials to book his motor bicycle to Switzerland as "hand luggage," and it was only by ill-luck that this ruse failed. The machine was actually being wheeled on to the boat on Lake Constance when the sharp eye of a German Army Officer caught it, and he came running to the boat side yelling out instructions to the porters to bring the machine back again.

Slow but Sure Travelling.

Incidentally, it may be mentioned that the journey from Stuttgart to Friedrichshafen (a distance of ninety-five miles) took fourteen and a half hours, which hurtling speed, it may be imagined, was enough to bore a motor cyclist to tears.

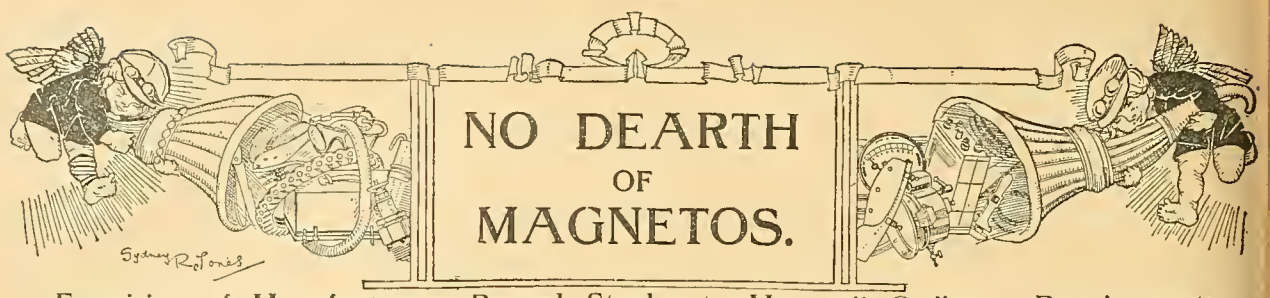
Mr. Graham saw a good deal of the German military motor cyclists (or rather what there was of them), and describes their numbers as very much inferior to the English riders, and also mentions that the equipment and condition of the machines are in no way equal to the British mounts. N.S.U.'s and Wanderers are mostly used.

Unlike many other English tourists, and particularly the two lady motor cyclists whose adventures in Germany were described in our last issue, Mr. Graham has nothing to complain of the treatment meted out to him, as every official he encountered acted civilly. He attributed this to the different temperament and manner of the inhabitants of Southern Germany from those of the North.

German Factories at a Standstill.

The factories in Germany are, of course, mostly at a standstill. In the leading factories of Stuttgart, where the greater part of the European magnetos are produced, within four days of the declaration of war only twenty-five per cent. of the workmen remained. Some factories, indeed, had only one-eighth of the usual number of men left. Motor works are practically at a standstill, no exports being possible. Every car in the leading motor works was commandeered by the Government, the Mercédès stock being taken over, though sufficient workmen were excused from the mobilisation to complete a batch of chassis which were in the course of construction. The complete vehicles will, of course, later be taken over by the German Army.

The machines used by despatch riders vary in age very considerably. Sergeant Jenner (late Royal Engineers) has a mount which was originally a Triumph with Fafnir engine—produced about 1904. Many alterations have been made to it, such as the fitting of Druid forks, a magneto, and a 2¾ gallon petrol tank.



NO DEARTH OF MAGNETOS.

Enquiries of Manufacturers Reveal Stocks to Meet all Ordinary Requirements.

IT has been rumoured in different quarters that a shortage of magnetos, due to the fact that we are dependent on Stuttgart for the majority of such machines used on English mounts, may seriously interfere with the motor cycle trade. In order to settle definitely whether such a rumour was founded on fact we made it our duty last week to enquire of the leading motor cycle manufacturers in the country as to the stocks they hold and their prospects of obtaining further supplies. In practically all cases we were assured that the different firms had sufficient magneto machines for their immediate requirements, some firms, indeed, having a stock large enough to last for some months even under normal demands.

Not satisfied with enquiries of manufacturers we addressed a letter, of which we reproduce a copy, to the different sources of supply, and we also append the replies received from the different magneto manufacturers and agencies. From these it will be seen that, so far from there being any real dearth of magnetos, each firm is still in a position to execute orders received, one firm indeed having such a large stock that its fear is that it will not be able to dispose of it for lack of demand.

It must be added, too, that there are two English firms now producing magnetos (the B.T.H. and the Thomson-Bennett), and from movements which are taking place in the City of Coventry, the centre of the motor industry, it is probable that in the near future other manufacturers will take up the manufacture of this important accessory, many thousand pounds worth of which have been regularly imported from Germany every month during the last decade.

Letter from "The Motor Cycle."

Sirs,—I am informed that the motor cycle business (especially that portion devoted to the satisfying of immediate demands from the Colonies and Overseas Dominions) is being interfered with by the alleged shortage of magnetos.

For the benefit of manufacturers and readers in general, would you kindly give me your view of the matter for publication, and outline any source of immediate and future supply of magneto machines you may have?

Yours faithfully,
THE EDITOR.

The Bosch Magneto Co., Ltd.

The Editor *The Motor Cycle.*

Sir,—We suggest that you send a representative here to see our stock of magnetos. In our opinion, we have enough stock here to last the motor cycle trade twelve months under the present conditions. Our fear at the present moment is not so much of running short of stock as inability to dispose of it for lack of demand.

THE BOSCH MAGNETO CO., LTD.

[At the request of the Bosch Co. we recently inspected the stock of magnetos held at 224, Tottenham Court Road, W.C., over which we were shown by Mr. J. A. Stevens, the secretary. After our visit we felt confidently assured that the company is by no means short of these indispensable motor cycle adjuncts. Considerably over 7,000 of all types were to be seen in the building, and in case of a shortage the company is making arrangements for manufacturing Bosch magnetos in England.—ED.]

S. Wolf and Co., Ltd. (Makers of the U.H. Magneto).

The Editor *The Motor Cycle.*

Sir,—We are keeping our regular customers well supplied with magnetos for immediate requirements. There will undoubtedly be a shortage, due to the fact that the most popular magnetos are manufactured in Germany, but we have every reason to believe that this difficulty will soon be overcome.

S. WOLF AND CO., LTD.,
Gordon Richards.

The Eisemann Magneto Co.

The Editor *The Motor Cycle.*

Sir,—As you are no doubt aware, it is impossible for us to import German made magnetos to this country at the moment for reasons which it is not necessary to narrate.

It may, however, be of interest to you to know that we have already made arrangements with our American House in Brooklyn to supply us with magnetos during the present crisis. Up to the moment of writing we have only been able to make arrangements for those of crying necessity, namely, of the four-cylinder type. We hope, however, shortly to be able to inform you that we have made arrangements for magnetos suitable for other types of road vehicles, including motor cycles.

Further, for your guidance, we may say that up to the moment of writing we have been able to supply all requirements coming to us from the trade in the United Kingdom, and we are still able to supply for various types of vehicles and motor cycles from our stock in London. For how long, of course, we cannot say. It depends on the demand. We can only say that up to the present moment there has been no refusal of supplies from this address to enquiries.

STANLEY J. WATSON.

Splitdorf Electrical Company.

The Editor *The Motor Cycle.*

Sir,—We quite agree that the immediate demand for magnetos has been greatly interfered with by the European War.

With regard to our view on the matter, we have been in constant communication with our home factory in America regarding deliveries of standard magnetos for this country. Of course, our home factory could not anticipate this immediate demand for such huge quantities of our magnetos, but they have buckled to and have cabled us that they can promise to supply us at the rate of 100 daily two weeks after receiving orders for all standard magnetos. Our EU and EV types of magnetos are absolutely standard and are interchangeable with all the other well-known makes.

We have been inundated with enquiries from most of the manufacturers of motor cycles and cars in this country. Should any of the firms with whom we are not yet in communication desire to see or examine any of our motor cycle magneto models, we shall be very pleased to forward them for their inspection, but owing to the phenomenal demand, our stock on hand in England at the present is getting rather short, but our home factory have informed us they are despatching a large consignment to us as soon as they can be shipped, and we feel sure that our people will do everything they can to make a shortage in our English friends' supplies impossible.

No Dearth of Magnetos.—

We were in rather a difficult position when this war broke out, as we did not wish it to be thought that we were trying to take advantage of the war to further our own interests, and we think it is for this reason that there is still in the minds of manufacturers some anxiety as to their magneto supplies for the coming season.

A few manufacturers require a specially made magneto to suit their motor cycles, and it will, of course, be up to them if they delay ordering very long, as even with our large factories in the States, we cannot guarantee to make magnetos with special specifications at a moment's notice.

SPLITDORF ELECTRICAL COMPANY.
H. O. Reed, p.p. Manager.

Thomson-Bennett, Ltd.

The Editor *The Motor Cycle*.

Sir,—With regard to magneto supplies: as we believe you know, we have been manufacturing magnetos for the past seven years, and therefore have a unique experience as far as this country goes.

At the time war was declared we were the only house with a British-made magneto on the market. We have repeatedly urged the British trade to face the question, and we have sent you a copy of a letter written by us last year, which will show you that the present position has been foreseen by us.

Owing to the lack of support we have received from the motor industry proper, we have turned our attention in other directions, and at the present time have a large business in magnetos with other users of internal combustion engines for marine, stationary, and agricultural work.

On the day following the declaration of war, we made arrangements for the increase of certain tools and moulds to enable us to increase our output very largely.

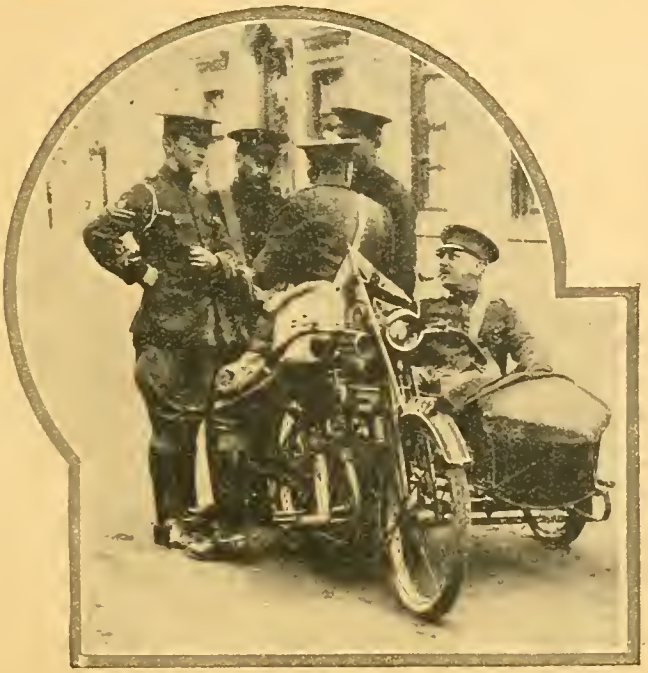
At the request of the motor car and cycle manufacturers we are specialising in a few models which they have specified as the ones they will require, and this will enable us, in a few weeks, very much to increase our output. If we have support from the motor manufacturers at once, we can expand very rapidly.

So far we have been able to keep all our friends going, and the arrangements we have made will enable us to do so in the future, provided we know at once.

What the trade should guard against is sitting down and waiting for something to turn up. Now is the time to move, while there are stocks on hand.

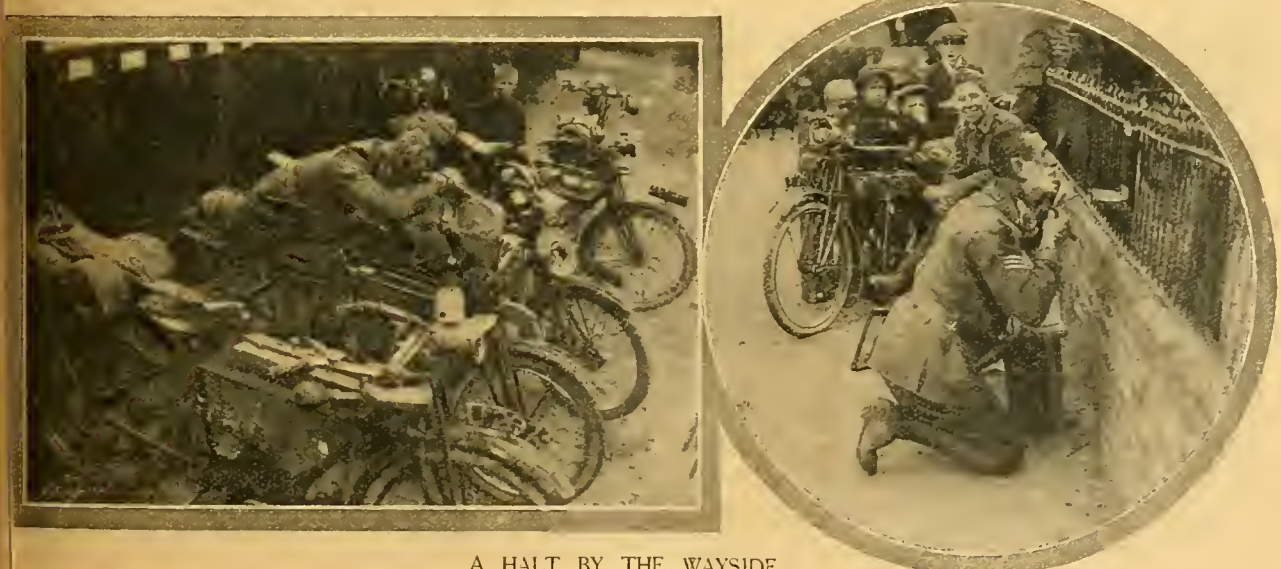
We make a full range of machines for one, two, and four-cylinder engines. These are not experimental models, but have been on the market for years.

THOMSON-BENNETT, LTD.
Peter F. Bennett, Managing Director.



A council of war.

Naturally the views of the various motor cycle manufacturers on whom we called varied somewhat, but in no single instance did we find an immediate shortage in the way of magnetos. All have sufficient supplies for a month or two, and several stated that their present stock is large enough to last for a long time to come without replenishments, and others have their contracts being carried out as usual. At the same time, arrangements are being made to replace German magnetos with machines of both British and American manufacture. One firm was rejoicing in the fact that a clerical error in dating an order had brought in a large supply of magnetos just before the war broke out.



A HALT BY THE WAYSIDE.

Late to "bed" and early to rise is the new order of things for motor cyclist despatch riders who are assisting in the defence of our coast. On the right, one of the motor cyclist section is seen attending to his toilet.

A Sturmey-Archer Countershaft Gear.

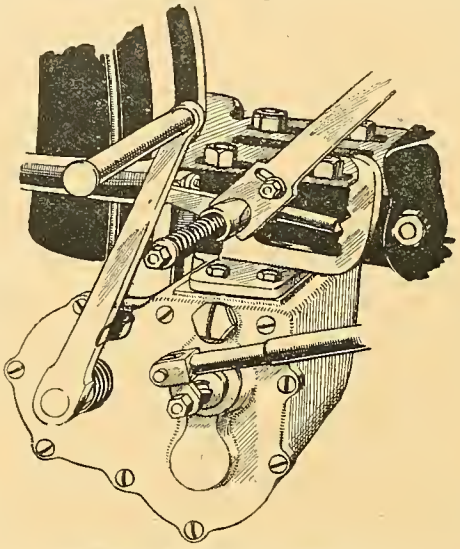
Sliding Dog Gear, giving Three Ratios; Enclosed Kick-starter; Cork Clutch. First Trials give Great Promise.

FOR some time past Messrs. Sturmey-Archer Gears, Ltd., Nottingham, have had their new countershaft gear box on test both in their own factory and in the hands of various well-known motor cycle manufacturers. From all sides we hear excellent reports of its behaviour, and particularly of the wonderful way in which it is possible to change speed quietly without the use of either exhaust lifter or clutch. The gears are in constant mesh, and the change is effected by sliding dogs which lock the required pinion to the shaft.

In outside appearance the box is very neat, and it is light and well made. The enclosed type kick starter is mounted on the off side, and on the near side lies the 8in. driving pulley with the chain wheel and clutch on the outside. The clutch has five plates, two of which are fitted with cork inserts, and the pressure is obtained from a series of comparatively small springs.

A Remarkably Sweet Clutch.

The illustrations herewith show the gear fitted to a 3½ h.p. Rover, on which the gear has given great satisfaction. In this case the clutch is controlled from the handle-bar, and the change speed lever is mounted on a quadrant attached to the gear box itself. Users of the gear inform us that the clutch is particularly sweet in action, and a restart can be effected on any hill which the power permits to be climbed on the run. The Sturmey-Archer Company have had such long experience with gears that it was reasonable to expect a neat and excellent production from their works, and, marching with the times, they have adopted the bottom bracket type for their latest model. It must not be imagined that the new counter-shaft gear is merely the hub gear modified to suit a different position, for its action is quite distinct, and, with certain important modifications, follows the lines of the usual three-speed sliding gear box.

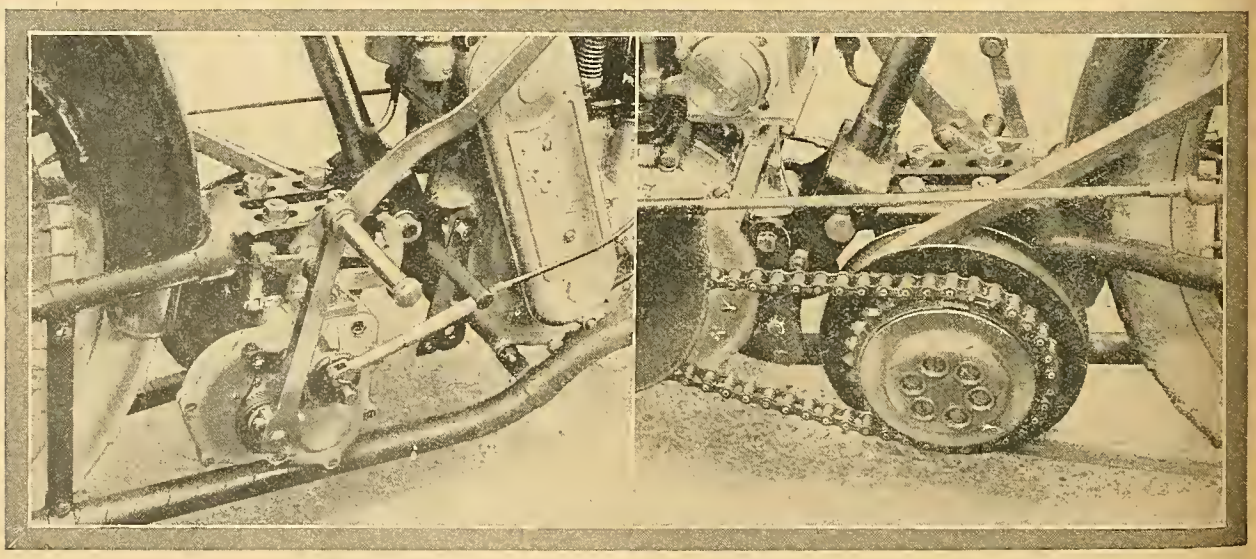


Showing details of the new Sturmey-Archer sliding gear and its method of attachment to the bottom bracket.

The kick starter is entirely enclosed, and is arranged so as to be conveniently placed for starting purposes. The lightness, fool-proofness, and simplicity of the box combine to make it a most taking proposition, which is sure to create a large demand in the near future.

The Hub or the Countershaft Type.

It must not be imagined that Messrs. Sturmey-Archer Gears, Ltd., intend to forsake the hub gear. On the contrary, they will place both types of gear on the market with equal confidence, realising that each has its own sphere in which it is pre-eminently useful. The hub gear is always likely to have its adherents, if only because of its adaptability to belt drive, and, despite the immense advance of chain transmission, we do not believe that belts are moribund, for we doubt if chains can ever provide quite such a sweet and elastic drive as does a belt. But the advent of this gear is particularly interesting, coming, as it does, from a firm which up to the present has exerted all its power in favour of epicyclic hub gears.

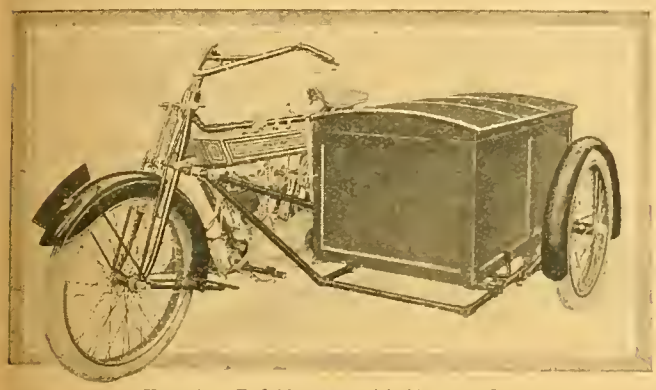


Both sides of the new Sturmey-Archer three-speed countershaft gear, with which is incorporated kick-starter mechanism

THE SIDECAR FOR BUSINESS PURPOSES.

LAST week we referred to the possibility of tradesmen replacing their horse-drawn conveyances with sidecar outfits for delivering light goods, and illustrated several of these handy little vehicles, which are so eminently suitable for the purpose.

We show herewith a tradesman's box of large dimensions attached to the well-known 6 h.p. Royal Enfield sidecar machine. Many of these commercial models



The 6 h.p. Enfield commercial sidecar outfit

have been supplied to tradesmen at home and abroad including a supply for the New Zealand postal authorities. Such a machine is perhaps not quite so roomy as a horse-drawn van, but it can cover at least three times as much ground. Transmission troubles are almost unknown on the Enfield machine with its chain drive and reliable two-speed gear

THE A.C.U. AND COMPETITIONS.

Clubs advised to "carry on" as usual wherever possible.

IN the weekly notes issued by the Auto Cycle Union, the governing body reiterates the editorial advice given in the leaderette in last week's issue of *The Motor Cycle* to follow the Chancellor's motto "Carry on." In speaking on the question of the holding of competitions at the present time, the A.C.U. circular says:

"Upon the outbreak of hostilities several clubs which had arranged to hold open competitions in the near future notified the Auto Cycle Union of their intention to postpone or abandon them. The Union is of opinion that, whilst, of course, local circumstances and conditions must necessarily be taken into consideration, yet where at all possible the Government's appeal to "carry on" will best be supported by the club's carrying out their fixtures as originally intended. Steady continuance of motor cycle competitions throughout the country cannot fail, to some extent, to have a stimulating effect on both sport and pastime, and consequently—which is of far greater importance—the motor cycle industry generally. It is, of course, to be expected that the huge entry lists to which clubs have became accustomed of late will considerably be reduced, but even assuming that the lists suffer to the extent of some 50%, even then such competitions would be well worth promoting under the circumstances.

"It is, of course, important that clubs should bear in mind as far as possible the question of expense, and so arrange their competitions as to enable prospective entrants to take part at the minimum of cost.

"Communications on this matter have been sent to all club secretaries throughout the country, and also to manufacturers, asking that, as far as within their resources, they will give their support to club and open competitions as hitherto."

The Motor Cycle will do all in its power to support the carrying out of the above advice.

THE EXPORT OF MOTOR CYCLES.

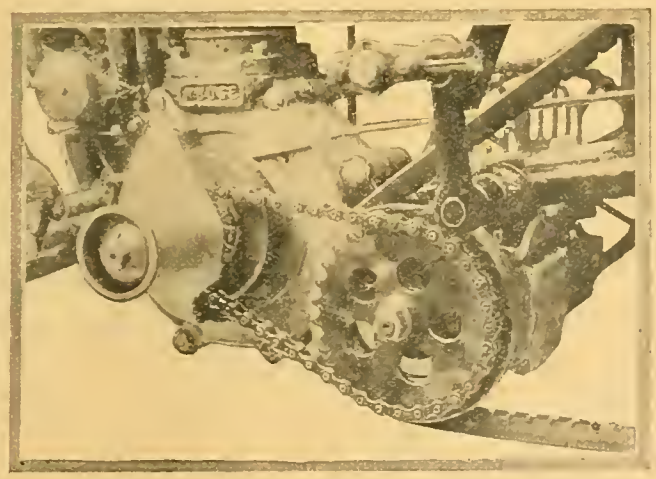
A CERTAIN amount of misconception exists in some quarters as to whether it is lawful to export motor cycles at the present time. A short time ago it was illegal to export any car over 8 h.p., but now all restrictions on both motor cycles and pleasure cars have been removed, and these may be freely sold to any friendly country.

It is also interesting to note that the rate of insurance has now been considerably reduced, and although, of course, much higher than during times of peace this renders the outlook much brighter, in so far as the export of motor cycles, parts, and accessories to the British Dominions, Colonies, and other places overseas is concerned.

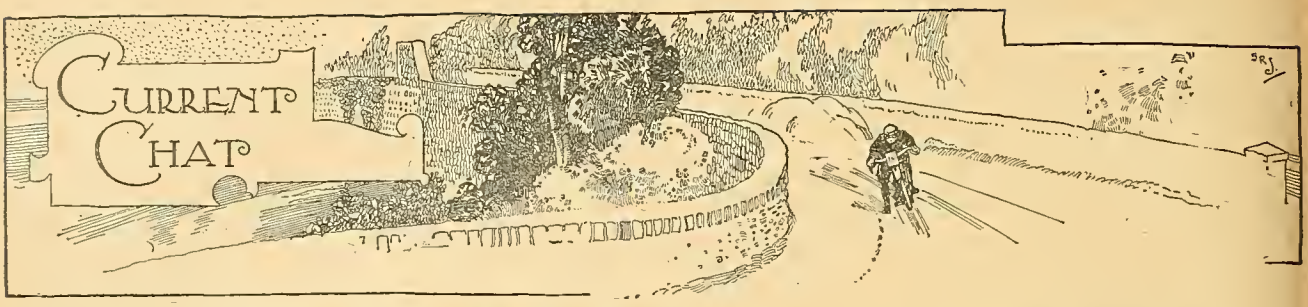
ALBION COUNTER-SHAFT GEAR BOX.

A Two-speed Gear made to fit Rudge Motor Cycles.

RIDERS of Rudge clutch models may be glad to hear of a two-speed gear made especially to suit their machines, and which can be fitted without alteration. The gear is a larger model of the Albion light gear box which has been much used this year on lightweights. The clutch and pedal-starting device can both be retained and the pulley also left in place, so that direct belt drive can be returned to at any time. The pulley on the gear box is 6½in. in diameter, and the sprockets which can be fitted give a high gear of 5 or 5½ to 1. The low gear reduction is 45%, *i.e.*, 9 or 10 to 1. Counter-shaft gears certainly seem to be making great headway.



The new Albion two-speed gear fitted to a Rudge



TIMES TO LIGHT LAMPS

Aug.	28	... ...	7.55 p.m.
,,	30	... ...	7.51 p.m.
Sept.	1	... ...	7.46 p.m.
,,	2	... ...	7.44 p.m.

Big Supplies of Fuel.

A full cargo of 70,000 barrels (2,800,000 gallons) of Pratt's motor spirit arrived in the Thames last week from America.

The Registration of Auto-wheels.

We have received from Mr. J. H. Weller the correspondence which took place between himself and the London County Council with reference to the transfer of registration of an Auto-wheel. The conclusion arrived at by the L.C.C. was that the Auto-wheel only should be registered quite irrespective of the cycle to which it was attached. Thus, in the event of an Auto-wheel being bought second-hand with or without a bicycle the registration can be transferred to the new owner on payment of 1s.

Brooklands Becoming Normal.

Though the Brooklands flying ground has been taken over by the Military Authorities the track is still open, and there is a great deal of interesting flying going on at the present time. We recently saw Major F. Lindsay Lloyd, R.E., who requested us to publish this information. Readers will be interested to hear that Major Lloyd has taken up his old work and is now with the Mechanical Transport Department of the War Office. Before his retirement, Major Lloyd was the first secretary of the Mechanical Transport Committee. It is hoped by the track authorities that the next B.M.C.R.C. meeting will be duly brought off to a successful issue.

A Harsh Ruling.

The importance of motor cyclists giving their full names when purchasing a new machine was exemplified in a case heard on Tuesday at Exeter, where Henry Hargrave Sullivan Hippesley, of Sparsholt, Wantage, Berks, was fined 10s. and costs for using an unregistered motor cycle. Mr. Hippesley purchased the machine of the Exeter Motor Cycle Co., who arranged that all the necessary formalities should be complied with, but they neglected to take their client's full name, and registration could not be effected. Letters sent to Wantage had no effect, because the owner was travelling He was stopped on Monday at Plymouth, and, to his surprise, was told his motor cycle had not been registered. An application by Mr. Hippesley's solicitor that the conviction should not be recorded on the licence was refused by the magistrates.

A Freak Finger Post.

One of the most curious wayfarers' guides in England is the one at Bromley, Kent, on the London-Hastings Road. It is a signpost surmounted by a striking biplane in miniature whilst on the three principal arms are models of a racing car, a monoplane, and a motor bicycle, under which appears the words, "To Brooklands." A common grievance against the ordinary guide post is that it only directs the traveller to the next village. This complaint cannot be urged against the Bromley post, which indicates the way to Jofin-o'-Groat's, Land's End, and Paris!

A Petrol Fire.

We have received information that 650 tins of petrol drawn in a steam lorry caught alight near Guildford the other day. Surely the transport of motor spirit in a steam vehicle is not the height of wisdom! Secondly, after the conflagration a number of fire engines played thousands of gallons of water on the fire. It is not surprising, therefore, that the road was full of water and flames, and that a river of fire was washed down the hill. Surely at this epoch of the motor industry the fire brigade authorities should have learnt that water is of no avail with a petrol fire, and that the only remedy is either sand or a chemical extinguisher.

SPECIAL FEATURES.

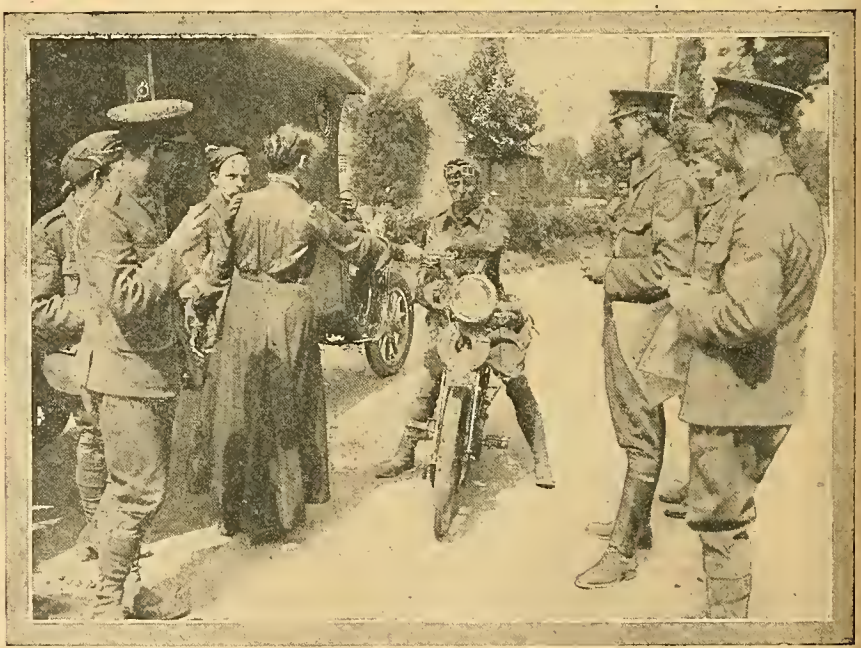
TWO NEW COUNTER-SHAFT GEARS.
HOME FROM THE WAR ZONE.
THE SUPPLY OF MAGNETOS.

The Popular Union Jack.

During a journey by motor cycle last week-end in the Midlands we encountered many motor vehicles of all types, and noticed that 90% proudly floated the Union Jack, the sizes varying from miniature flags on motor cycles to large sized flags flapping in the breeze on cars.

A Sidecar Trial in New Zealand.

A severe sidecar reliability trial was held in the south island of New Zealand on the occasion of the King's birthday. Three hills of five miles long were included, and in some places the gradients reached 1 in 4, while rough surfaces and hairpin bends were common. On the homeward journey three inches of snow were found on the hill tops. Unfortunately, some discussion as to the winner occurred, and the original winner was disqualified. A. B. L. Smith, on a Clyno sidecar outfit, proved the winner, with a score of 999 out of a possible 1,000. He was the only competitor out of twenty-seven to accomplish a non-stop run throughout, which conclusively proves the arduous nature of the course.



AN EAST COAST SCENE. "Tommy" is in favour in all the towns and villages.

Meetings Cancelled.

The Public Schools M.C.C. has deemed it advisable to cancel all fixtures for the present, but it is hoped to hold a trial later when the European crisis becomes less acute.

The Anglo-Dutch Trial.

As was anticipated, the Dutch Motor Cycle Club has now notified the Auto Cycle Union that, owing to the war, the Anglo-Dutch Trial fixed to take place in Holland in September must necessarily be abandoned.

N.W.A.A. Social Meet.

On Saturday last about 250 members met at Delamere and spent the afternoon in the famous Cheshire forest. A prize was offered for the best attendance before 3 p.m., but most clubs did not compete. The best figures were Oldham 28, Liverpool Amateur 18, Mersey 15, Hyde 12, and Chester 9.

The International Cycle Car Race.

The Auto Cycle Union has, up to the present, intentionally refrained from making any announcement with regard to the holding of the International Cycle Car Race fixed to take place in the Isle of Man on Thursday, the 2nd September next. An official announcement will, however, be made to-morrow (Friday) after the meeting of the Competitions Committee of the Union.

The Country at its Best.

Those fortunate persons who possess sidecar outfits have been particularly lucky the last few week-ends. Glorious weather has made travel along our country lanes a perfect feast of colour to the eye. Seldom has such a splendid harvest been seen, and the fruit is on the trees in abundance. Added to this there has lately been a marked decrease of motor car traffic on the roads, due, no doubt, partly to mobilisation and partly to the fear of petrol prices soaring. Luckily, the latter scare has subsided, but after all it only serves to accentuate the cheapness of the sidecar as a family conveyance. We say "family" advisedly, because we met sidecar after sidecar last week-end in the Midlands with three and sometimes four up. We must say we are all against this overloading, and it is a great testimony to the general excellence of sidecar construction that accidents through breakage occur so seldom. The chief danger is the possible fracture of the front support of the sidecar, which, in cases where more than normal loads are carried, should be duplicated.

A.A. and M.U. Notes.

Until further notice, the head office of the A.A., Fanum House, Whitcomb Street, London, W., will be open day and night, including Sunday, for any urgent messages, telegrams (Fanum, London), or telephone calls (300 Regent).

This will also apply to the principal provincial branch offices at Manchester (5489 City), Leeds (2027 Central), Birmingham (973 Central), Exeter (1000 Exeter), and Glasgow (7199 Central).

WARNING TO DEVON TOURISTS.—Members touring in the Tavistock-Launceston district should note that a new quarry has been opened a short distance from the Tavistock side of Greystone Bridge. It is approached round a bend, and the district surveyor has promptly erected warning notices. Greystone is roughly about nine and a half miles from Tavistock and about four miles from Launceston.

A.A. PATROLS AND ROAD OBSTRUCTIONS.—The road patrols of the Automobile Association have instructions always to dismount from their cycles and remove large stones or other obstructions which they may find on their beats. In mining districts, where trucks loaded with stones are constantly passing over the roads, the A.A. patrols frequently find and remove large stones which would easily capsize motor cars and motor cycles. The road patrol stationed on the Exeter-Penzance Road recently reported that this evil was getting worse in his district, and the secretary at once communicated with the owners of the trucks from which the stones complained of had been dropped. The company have since informed the Association that they are glad to have their attention drawn to any inconvenience caused to the public, and that an instruction has been issued to their employees that this trouble must not be caused.

A ROAD IMPROVEMENT.—The Automobile Association learns that the very dangerous corner hitherto existing at Markyate (at the junction of the London-Coventry and Luton Roads) is to be removed. The Luton Road is very narrow, and is concealed from the view of motorists using the Coventry Road by a 10ft. brick wall, situated at right angles at one corner. This wall is now being taken down, and will be re-erected with an easy bend, which will round off the corner and enable motorists coming from the London direction to see cars approaching the main road.

A Military Model.

We are informed by Messrs. Quadrant Motors, that they are specialising on a military model 4½ h.p. single-cylinder motor cycle, several of which have already been supplied to the War Office. The Quadrant factory is very fully employed at the present time and actually working overtime.

Important Hill-climb on Saturday.

Other clubs will no doubt follow the lead of the Coventry and Warwickshire M.C. in continuing arrangements for its annual open hill-climb next Saturday, the 29th inst. Upwards of a hundred entries have been received so that the event will be an important one. The venue is Style Cop, Rugeley, Staffs., a popular spot for hill-climbing events.

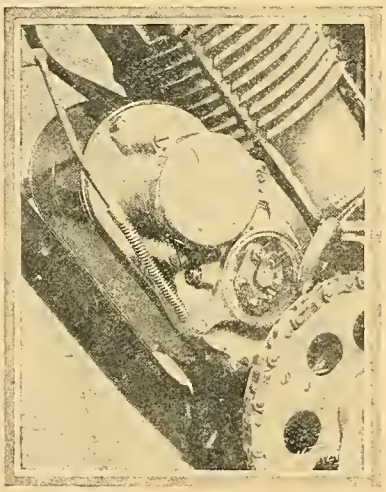
J. F. Sirett (on left), who has competed in several Tourist Trophy Races, along with a comrade, leaving Manchester for their new camp at Littleborough. Their machines are an Indian and a Douglas.

The Splitdorf Dynamo and Magneto.

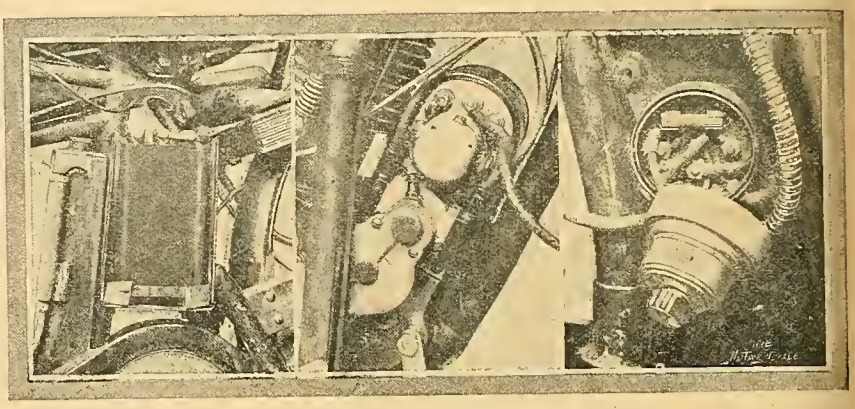
A COMBINED MACHINE FOR LIGHTING AND IGNITION PURPOSES.

OF late we have become accustomed to the dynamo lighting set, and as has already been forecasted in *The Motor Cycle*, electric lighting by means of a dynamo carried on the machine is to be one of the features of 1915 sidecar design. The possibility of combining the dynamo and magneto, so forming one compact instrument for ignition and lighting, was discussed in a recent article in these columns, and subsequently we learned of the new Splitdorf dynamo-magneto, which we are now enabled to describe and illustrate for the first time. This compact and well-designed instrument will most likely be adopted by several important firms.

To combine a lighting dynamo with the magneto is, of course, ideal, especially when carried out with the simplicity with which the Splitdorf unit is designed.



The Splitdorf dynamo-magneto, showing the cover removed from contact breaker of the magneto.



(1) The Elba accumulator which is fitted behind the seat tube. (2) Showing position of Splitdorf dynamo-magneto and drive. (3) The Splitdorf switch and fuse box. The switch itself is contained in the cover, and is operated by the middle handle shown on the outside.

There are two armatures placed one above the other, the upper one being that of the generator. The magnets used are not permanent, but are excited in the first case from current stored in the accumulators. To start the engine a few revolutions are obtained from the kick starter, and in doing so a small contact is put into action by means of a centrifugal governor. This allows current from the battery to pass to the shunt coils of the dynamo from which more current is generated, and the magneto magnets then become excited. The magneto works in the usual way, as the armature and contact breaker are quite orthodox. The whole unit is extremely compact, and when viewed externally differs but little from the ordinary magneto, but it is somewhat taller. Accessibility has been looked after throughout, and removal of a small cover at the top lays open the connection terminals for inspection. The brushes of both armatures are also easy to get at, and a small regulating coil is utilised for dissipating excess current, so that it is impossible for the batteries to become overcharged.

The switch is one of the bayonet-jointed type, and for every notch engaged one lamp is put into action. It should be mentioned here that a small pilot lamp is used in the head light for town work. An ammeter is attached to the top tube, which can be viewed comfortably from the saddle. The dial is divided into two portions which denote the rate of charging or discharging respectively. The battery, which is known as the Elba, and is manufactured by the Willard Storage Battery Company, is stowed away neatly behind the seat tube.

The present lighting set, which is the only one in England, has been tested some 2,500 miles, and during that time has given no trouble whatsoever. The engine starts easily even when the battery is so run down that there is not sufficient current to operate the small pilot bulb in the head light.

Coventry Open Hill-climb on Saturday.

Magnificent Entry. How to Get to the Hill.

THE Coventry and Warwickshire Motor Club has received upwards of a hundred entries for its hill-climbing competition on Saturday next—splendid support to the committee's adoption of the "Carry on" motto. The entries include many of the leading hill-climbing experts. As regards the venue, originally it was arranged to hold the climb at Portway Hill, near Stroud, but at a committee meeting on Monday evening the venue decided upon was Style Cop, Rugeley, and a member of the committee spent the whole of Tuesday making the necessary arrangements in the locality. The competition will start at 1.30 p.m. prompt, and competitors will be weighed at the top of the hill immediately after each climb. Two Messrs. F. T. Bidlake and A. G. Reynolds.

An Easily Reached Hill.

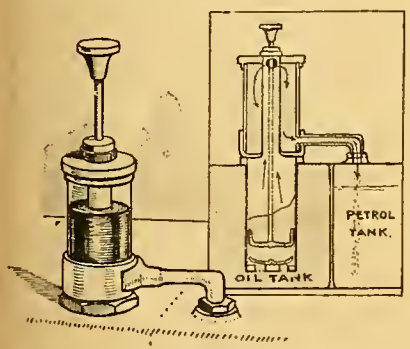
Style Cop is a very convenient rendezvous for Midland riders. It lies about two miles from Rugeley on the Wolverhampton side, and is easily reached from all sides. From Birmingham, riders should go through Sutton Coldfield, Lichfield, straight past the cathedral to Rugeley, about twenty-four miles, while Coventry riders should proceed to Stonebridge (where turn right), Lichfield, and Rugeley, thirty-four miles. From Stoke, Style Cop is about twenty-six miles through Stone, Stafford, and Rugeley, and it is equally easily reached from Derby through Burton-on-Trent, and from Shrewsbury through Newport, Stafford, and Rugeley. There should, in consequence, be a big muster of spectators at the Coventry and Warwickshire open climb next Saturday at Style Cop.

A HURRIED MOVE.

Many of our readers are aware that Brooklands has been turned into a military flying ground, and has lately been given over entirely to the forces of the Crown. The result of this has been that the works of Messrs. A.B.C. Road Motors (1914), Limited, have been taken over by the military authorities, and this company, therefore, has had to move rather earlier than expected into its new works at Hersham, near Walton-on-Thames. This will entail a considerable dislocation of business, but once installed the company will be able to make more rapid deliveries than previously. It is interesting to note that Mr. R. L. Charteris, managing director of the company, who is on the Special Reserve, has been mobilised with the Royal Flying Corps.

THE LUBRICATION OF TWO-STROKE ENGINES.

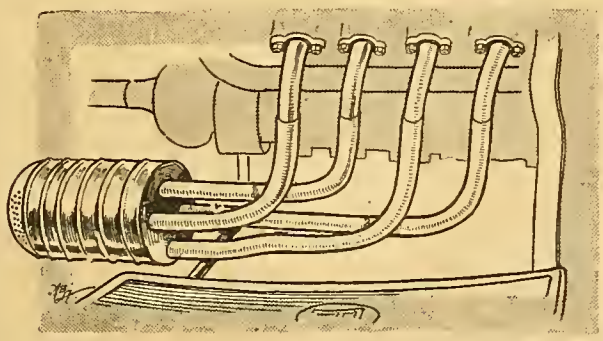
One of the greatest impediments to the success of the ultra lightweight movement is the unmistakable crudeness that is affected by some designers. Simplicity we know is necessary, but when obtained at the expense of reliability it becomes unpardonable. On two-stroke machines it is quite safe to say that a large percentage of such failures can be traced to inefficient lubrication systems. Of ceurse, by far the most popular form of introducing lubricant in this particular type of power unit is that of mixing oil with the fuel which, so far as the cylinder is concerned, has proved itself more or less satisfactory. To prepare the mixture in the first place is often tiresome, as only small quantities can be added at a time, or there is a risk of the oil going straight to the carburetter and choking up everything. There is a device, however, produced by A. C. Davison, 163, Arlington Road, Camden Town, N.W., in which this trouble is reduced considerably. It consists of a pump barrel surrounded by a cup, out of which is a small duct leading into the petrol tank. Oil is drawn into the barrel, and on the return stroke, instead of being pushed back, it finds its way to the upper side of the pump plunger washer, as there is a non-return valve to the oil tank. Thence it flows into the upper chamber through a hole in the central barrel and so runs slowly into the tank through a small tube.



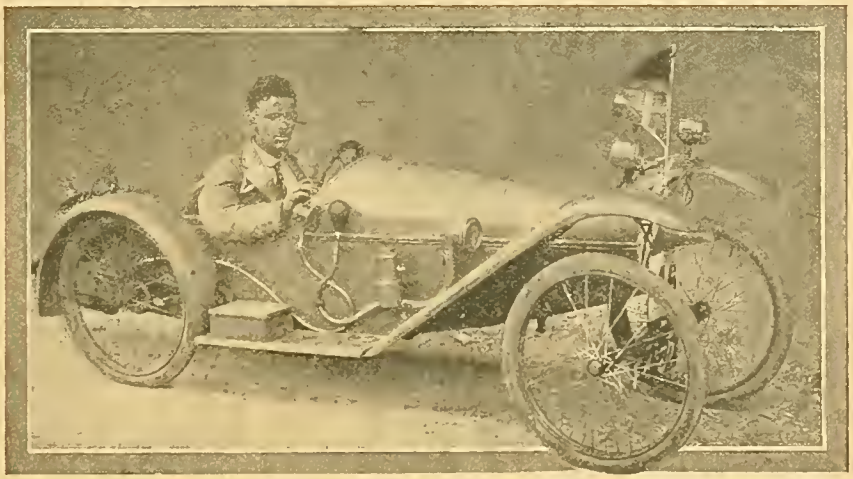
Davison's lubricator for two-stroke machines.

THE SILENCE QUESTION.

We illustrate herewith a method of attaching a silencer to a four-cylinder F.N. machine. The silencer in question is made by J. C. Lyell, 113, Great Portland Street, W., and is known as the Clair. It is arranged in such a way that cups can be added or taken away if necessary by simply unscrewing the central bolt. The job was designed and completed by Purcells, Ltd., of Charlotte Street, W.



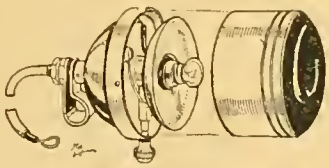
A neat arrangement of attaching a Clair silencer to a four-cylinder F.N. Note the separate exhaust pipes for each cylinder



A 5 h.p. Carden cycle car, a vehicle of racy construction which has been termed the "motor cigar." The engine and gear are arranged at the rear. W E. Humphries, the driver seen in the illustration, is acting as a despatch rider with the Army.

A MAGNETO LIT TAIL LAMP.

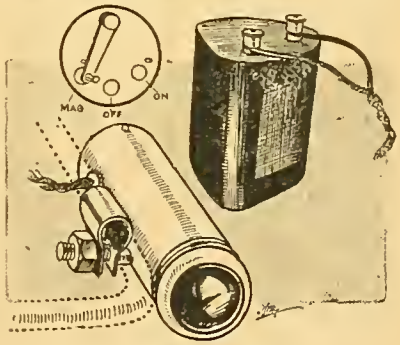
The accompanying illustration shows the "Magnetob" rear lamp, sold by Messrs. H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W.C. The lamp consists of a switch, separate coil winding, reflector and bulb, and is connected to the earth terminal of the magneto by the armoured cable shown. Many of our readers do not appear to be aware that all magnetos may be had with an earth terminal on the contact breaker cover if so specified, and a contact breaker cover fitted with this terminal may be obtained from the magneto manufacturers. To switch on the current the small knob is pulled out. To fit the device it is only necessary to attach the lamp in the required position, carefully uncoil the armoured wire, and run it direct to the magneto. It is important that the lamp should only be fitted to magnetos running at half the speed of the engine.



The novel "Magnetob" lamp.

ANOTHER REAR LAMP.

An electric rear lamp which derives its current from the magneto has just been put on the market by the Krisco Patents Syndicate, Church St., Walton-on-Thames. A small clip is used for attaching this device, which is shaped like an ordinary torch, to the carrier. When standing still a small battery can be used, and is put into action by means of a switch attached to the rear of the lamp.



The Krisco electric lamp.

REAR LIGHTS FOR SIDECARS.

Two examples of rear lights for sidecar combinations are supplied by Messrs. Bransom, Kent, and Company, Limited, 40, Great Eastern Street, E.C. Both the models are of solid construction, and can be attached with very little trouble. We illustrate one herewith, which is designed to be attached to the sidecar mudguard.

The B.K. rear light

The London Volunteer Defence Force.

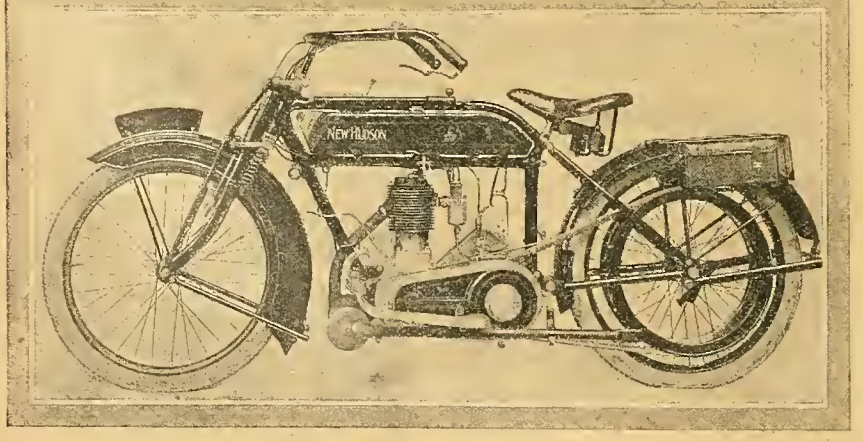
On page 251 of last week's issue we made a reference to the London Volunteer Defence Force. The hon. sec. of the above has received the following official communication from the War Office: "Keep your committee together for future possible action. Deprecate further forward movement for the present." The committee feel that when Lord Kitchener's new army is complete official consent will be granted for them to go on with their work of training those whom necessity keeps at home.

Stepney Wheel Directors and the War.

The Stepney Spare Motor Wheel, Ltd., Stepney Works, Llanelly, S. Wales, have, we hear, decided to pay 30s. a week to all employees going on active service. Two of the directors, Messrs. T. M. and Walter Davies, have also offered their country residence, Sharcombe Park, Somerset, with forty acres of ground, for use as a hospital.

The Military Model New Hudson.

This new military model from the New Hudson factory, Birmingham, to which we made allusion in last week's issue, and which we now illustrate, is notable for a new design of frame. The point of this is that it allows the complete power plant, consisting of engine, gear box, and magneto, to be removed and replaced as a single unit when so desired for purposes of repair. The further advantage of this plan is that perfect alignment of the engine and gear box can be achieved on the bench before assembling the unit into the frame. The engine is, of course, the well-known 85×88 mm. bore and stroke single-cylinder New Hudson, and the whole machine presents an uncommonly workmanlike appearance.



The New Hudson military service model.

A Motor Cycle Agency Capture.

Messrs. Robertsons' Motor Agency had an exciting experience the other day. A German called at their depot in Great Portland Street, W., and first asked for a Harley-Davidson catalogue. On one being shown to him he said that what he really wanted was an instruction book. When he got this he said he would like a key for a Harley-Davidson tool-box, a question which aroused a certain amount of suspicion. On being asked why he wanted it he replied that it was to open the tool-box on a friend's machine who had lost his. Somebody then said, "Please give us the name of your friend," which he did, giving the name of a foreign customer whom the staff knew well, and whom they thoroughly trusted. He was then asked to come inside, but said he could not as he had an appointment elsewhere. A little muscular persuasion resulted in his entering the shop, and as soon as he got inside he started struggling and eventually succeeded in escaping into the street, but was rapidly hauled back and kept in custody until the police arrived. He then confessed that he had stolen the machine from the customer whose name he gave as reference, and was recognised by the police as a man who had been wanted for some time in connection with motor cycle thefts. Irrespective of the offence he had committed he was liable to prosecution for riding a motor bicycle, as motor bicycles are, of course, forbidden to persons of German nationality. The police were exceedingly grateful to Messrs. Robertsons for the prompt action they had taken, and regarded the capture of the ex-German waiter as an important one.

The motor cycle section of the East Lancashire Divisional Signal Service. The machines include an Indian, Rudge, two Bradburys and an Ariel.

A Busy Week-end.

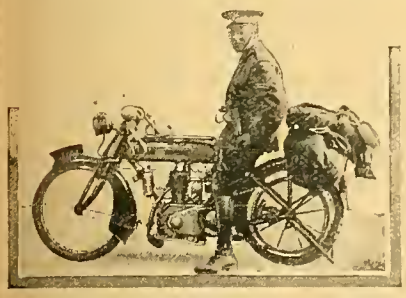
The Triumph and Rudge works were busily occupied over the week-end on urgent Government orders. The goods in execution of these orders were ready on Sunday evening, though the orders were only received on the morning of the previous day.

British Machines at the Front.

Despite the vigorous censorship scraps of news from those on military service at the front continue to leak through, and news has been received from the well-known French rider Gabriel that he is serving as a motor cycle despatch rider with the French Army on his Triumph, with which he expresses the greatest satisfaction. It is significant of the excellence of the British motor cycles that many of our best-known makes are employed by the French War Office.

Premiers in the Army.

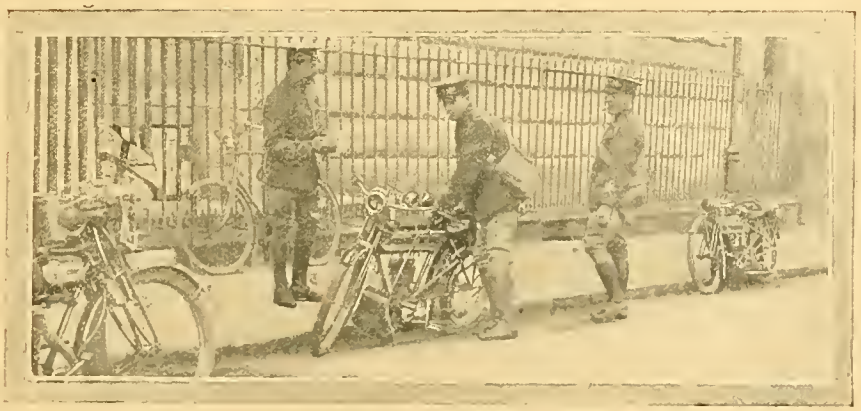
A number of 3½ h.p. Premier counter-shaft three-speed machines has been supplied to the War Office for use with the Expeditionary Force, and two machines for Lord Lonsdale's Colonial Corps. Our photograph is of Corporal G. Drew, attached to 1st Signal Squadron Royal Engineers, 1st Cavalry Division, Expeditionary Force.



Corporal Guy Drew (Royal Engineers), who is attached to the Seventh Lancers. His mount is a 3½ h.p. counter-shaft geared Premier.

A Rumour Contradicted.

A rumour has gained some currency through a statement having appeared in certain journals that the Birmingham Small Arms Co., Ltd., had received an order for 3,000 motor cycles from the War Office. This report was not published by *The Motor Cycle*, and we are asked by the B.S.A. Co., Ltd., to state that the report is not true. The order was for a supply of special B.S.A. military pattern pedal cycles.



Members of the motor cyclist section of the Warwickshire Yeomanry preparing to leave headquarters.

The London Motor Cycle Reserve Committee.

Captain Stafford's duties have been completed and he has delegated the selection of motor cyclists on the "waiting list" to Lieutenant H. B. C. Pollard, secretary of the London Motor Cycle Reserve, Fulham House, Putney Bridge, S.W. At the present time applicants are being graded according to their suitability, and a register of these has been made, divided into suitable and unsuitable, with a medium class for men who have unsuitable machines. Shortly the Committee will be in possession of full particulars of each volunteer, who will be called upon as needed. Enthusiasts anxious to get on the formal "waiting list" for the next batch of Special Reserve R.E. are advised to parade with their machines for inspection between 12.30 and 3.30 p.m. or at 6 p.m. Civilian motor cyclists are urgently warned to avoid the wearing of semi-military kit, to the labelling of their machines O.H.M.S. without written authority from an officer or police inspector, and to halt instantly when summoned to do so by pickets. Infraction of these rules will be most severely dealt with.

On the enlistment form the applicant is required to state his name and address, qualifications, whether he has had previous military experience, or if he has knowledge of foreign languages, particulars of the machine, date of manufacture, gear, and engine number. The form concludes with the following note:

"Recruits are desired to enlist in the R.E. Special Motor Cyclist Reserve, which may involve service abroad. Those limiting themselves to the possibilities of Home Service should mention their districts."

The Type of Machine Required.

The only machines suitable are 3½ h.p. single-cylinder machines, of well-tried and approved make. They must have variable gears and 26in. wheels. Horizontally opposed twins of 2¾ h.p. and 3½ h.p. are the twin-cylinder type favoured. Applicants with machines outside this category should still fill in this form, as it is useful in compiling a register of motor cyclists ready to serve. Having completed this form, motor cyclists will be asked to attend, at their own expense (paragraph 7, War Office Order, June 19th, 1913), at Fulham House, Putney Bridge, where they and their machines can be inspected and official waiting list forms filled up.

It should be borne in mind that desirable applicants should have satisfactory physique to endure the rigours of a campaign, machines in perfect condition, and, wherever possible, previous service or military training. Only a limited number of motor cyclist vacancies are open, and applicants not eligible are reminded that they can render satisfactory discharge of the duty that they owe their country by joining the ordinary Forces of the Crown and shouldering a rifle. Non-acceptance as a military motor cyclist does not relieve the individual of his responsibility towards his country. He should enlist in some other branch of the Service.

WITH THE SCOTTISH HORSE.

Lieut. Black (in sidecar), of the Scottish Horse Regiment, receiving a telegram. This officer says it would be impossible for him to do half the amount of work he has to do without the use of the motor cycle and sidecar. These are the only motor cyclists attached to the Forces who wear the Athol bonnet

PETROL AND OIL TINS AS TABLES.

Motor cyclists of the Royal Engineers, signal section. The rider with the chunk of bread is G. E. Cuffe, a well-known competition rider.

Northern Despatch Riders.

The Northern Cyclist Battalion are stationed on the Durham and Northumberland coast, and the motor cyclists attached to that body are busy despatch riding and on patrol work.

Sidecars and Government.

So far very few sidecars have been pressed into service by the Government, which is surprising in view of the small amount of room they take up on the road, their speed on the level and uphill compared with low-powered cars, and their economy in petrol consumption compared with an ordinary two-seater.

Bristol War Committee.

The Bristol Motor Cyclists' War Committee has been formed with Rev. P. W. Bischoff as secretary.

A Corps for Bridgwater.

A very enthusiastic meeting of motor cyclists was held in Bridgwater last week with a view to forming the Bridgwater Motor Cycle Corps for local defence and other service. Influential support has been given and an appeal has been issued locally for funds. The headquarters of the Corps are the huge garage of the Bridgwater Motor Co., Ltd. There is no doubt that such local corps can be of good service, although at the present time any but official action is not encouraged by the authorities, but still the riders are fitting themselves for duty if wanted.

TWO CYCLE CARISTS' ADVENTURES.

An Exciting Trip from Grenoble to Havre under War Conditions.

THE last we saw of Mr. Chater-Lea was at nine o'clock in the morning at Grenoble on the memorable Sunday on which France declared war with Germany. He, in company with other English drivers who had entered for the International Six Days Trial, had been told by the British Consul that there was little likelihood of his having any trouble in getting through to England, and he therefore decided to see the Lautaret and Galibier Passes. At the Consulate Mr. Lea met C. Pressland, the driver of a Crouch Carette, and they both decided to take the Galibier together, and after doing so they descended and made for the Lautaret summit, where they met a Danish professor and his wife who were in a terrible state owing to all vehicular traffic other than military being stopped on the pass, so Pressland took one and Chater-Lea the other and brought them back safely to Grenoble the next day. The tunnels on the passes were in very bad condition owing to damp and wet, and passing was exceedingly difficult owing to the number of troops on the road, and so bad was the condition of the latter that Mr. Lea assures us that anyone on a motor bicycle would have had to dismount.

A Petrol Difficulty.

Next morning a start was made for Aix-les-Bains, where on the road round the Lac de Bourget Mr. Chater-Lea began to realise the seriousness of the situation. Every crossing was, of course, guarded. A genuine difficulty was experienced in getting petrol, and thinking that probably it would be easier to obtain in the country, they refused to pay the exorbitant prices

The Crouch and Chater-Lea cycle cars on the Galibier.

demanded, but at the next village, when he stopped at a grocer's shop and asked the woman behind the counter to sell him some, she absolutely refused, but finally the daughter persuaded her mother to sell one can only, and that to be shared between the two cars. The man, who overheard the conversation, flew into a passion and said he had undertaken to sell no petrol, and nothing would persuade him to do so, but fortunately the *Maire*, who had come along, recognised that it was a case of two Englishmen in dire distress, and the one can was allowed to be sold. France was under martial law, and no one was allowed to be on the roads after 6 p.m.; consequently they had to stop at Culoz, a little station on the main P.L.M. line. Here Mr. Lea, who was the only member of the party who could speak French, went to the *Maire* and asked him to give him a *laisser-passer*. This was made out for W. Chater-Lea and his family in two cars to be free to pass from Culoz on their way to England.

An Unpleasant Experience.

The next village they came to was quite a small one, and all the population appeared to be in the street, and they were forced into the *Mairie*, where their papers had to be shown. This was an unpleasant experience, but nothing in comparison with what was to follow. Pressland and Sanders, his companion, thought they knew the road to Virieu-le-Grand, but at one turning they mistook the way, and here a car containing an officer and some soldiers passed by them. Pressland went back to look for the road and Chater-Lea waited As the car passed it

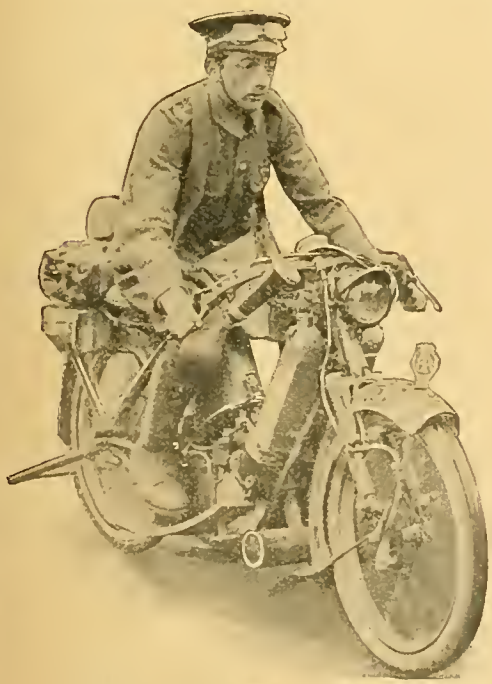
The 'Tourist Trophy'

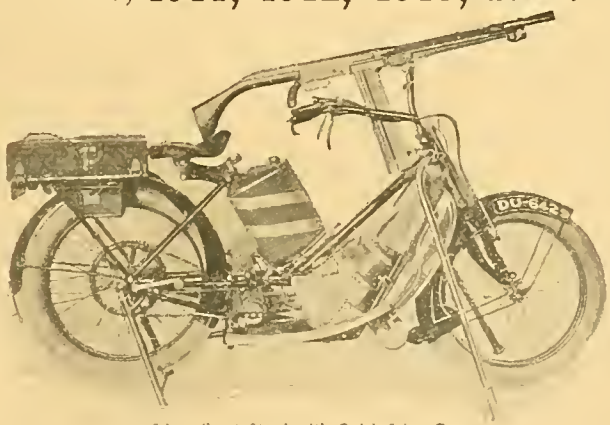
SCOTT

and The War.

WHY is it that so many motor cyclists volunteering for despatch carrying and other military work are purchasing Scotts? Because they have assured themselves of the reliability, speed, and all-round excellence of the Scott. As their safety and the success of their efforts, which mean so much in modern warfare, depend almost entirely upon the general efficiency of the machine, their choice speaks volumes for the Scott two-stroke.

N.B.—The Scott motor cycle, in addition to winning the Tourist Trophy, **has on four successive occasions made fastest lap times** *i.e.*, **1911, 1912, 1913, 1914.**





3½ h.p. Scott fitted with Quick-firing Gun.

The mount supplied to the War Office—

the Quadrant 4½ h.p. solo — is identical in all essential details with the machine we offer you.
"There's no query about Quadrants," and the confidence of the War Office is further proof of that.
Distinguished by absolute reliability, the

QUADRANT

is an ideal mount for "active service," and under war conditions will emerge from the severest tests triumphantly.
Note these details —
4½ h.p. Armstrong 3-speed Gear and Free Engine — Dunlop Tyres and Belt — Bosch Magneto — Senspray Carburettor — Quadrant Spring Forks —
And these prices —

SOLO 45 Gns. – COMBINATION 55 Gns.

And then — let us send you full descriptive Folder.

QUADRANT WORKS, Lawley St., Birmingham. London Depot: 78, Great Queen St., Kingsway.

QUADRANT

HALT!

was remarked that its occupants scrutinised the Chater-Lea very carefully. A few minutes after it passed again, going in the reverse direction. Chater-Lea came back and found Pressland had been arrested. His passenger had been turned out and put in the car, and a soldier was sitting beside him holding a revolver in a threatening position. Matters looked truly serious, and, of course, Chater-Lea stopped. While he was not looking, and conversing with the officer, a soldier roughly pulled Mrs. Chater-Lea out of the small car and put her into the big one carrying the soldiers. Chater-Lea was told to take the wheel again, and had an armed soldier sitting at his side. Both small cars, in front of the big one, then drove to Virieu. Evidently both had been mistaken for Germans, and an hour and a half was taken up in searching the cars, the luggage, and the occupants, but, of course, nothing incriminating was found, but Pressland was made to open his camera, and the films were torn up and scattered to the winds. Fresh passes were then issued, and they were told to make their way to Bourg and report themselves to the *Prefecture*. If they missed the way they were to go on as best they could, but whatever happened they were strictly enjoined not to turn back. On the road from Mâcon to Charolles, which leads to Nevers, the Crouch suffered tyre troubles. An officer in a car stopped and said that there must be no loitering on the road. If they had tyre troubles they had better cut off the offending covers and drive as best they could on the rims. Eventually they reached Charolles, where patches were purchased, and thereafter things went more smoothly.

A good run was made to Orleans, where in one of the large squares Pressland and Sanders were recognised as Englishmen. They were lifted out of their cars and carried shoulder high round the town. A man who was selling plums came up to Mrs. Chater-Lea, took hold of her affectionately by the shoulder, and thrust a handful in her hands and would not hear of payment. So enthusiastic was their greeting that it became quite embarrassing. The next morning a move was made to the *Commissaire de Police*, with the object of getting the papers *viséd*. This, however, could not be accomplished before nine o'clock which was indeed hard luck, as one might only travel between the hours of six in the morning and six at night. At last the offices opened and an attempt was made to get the papers signed. Matters looked pretty hopeless at first, standing amid carters, peasants, foreigners—in fact, anyone who wished to travel from place to place. It was not, therefore, till nearly eleven o'clock that they were on the road again. All along sentries were found posted on bridges, at level crossings and at the beginning and end of every village and town, and as on one day Mrs. Chater-Lea counted more than one hundred stops it will be understood that no great mileage could be accomplished.

Here Mr. Chater-Lea related to us that down in the south yokels in their working garb and wearing only the *képi* of the French soldier kept guard, all armed with rifles with fixed bayonets. Barricades were put in the villages, which varied in efficacy according to the ingenuity of the *Mairie* of the place.

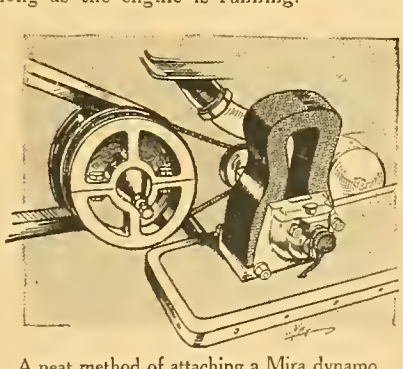
Difficulties at Rouen.

At Rouen, where they expected to get through quite easily, they found the greatest trouble. After waiting three-quarters of an hour at the *Mairie*, the *Maire* refused to sign the papers, and they had to go before the *Commissaire de Police*, who refused the papers as no photographs were attached to them. In previous places the photographs on the international pass had been accepted, but at Rouen the *Commissaire de Police* refused to recognise this procedure, but on being appealed to to help them out of the country, he agreed to allow the photographs to be taken by the prison photographic department, at a nominal charge of one franc per photograph. Here again a difficulty cropped up, as by this time all the French money had been absorbed, but the *Commissaire*, who by this time had assumed a more kindly tone, sent out and got the money changed. The photographs were taken in double quick time, and in surroundings such as an ordinary law-abiding citizen does not ever see. All round were measuring instruments for taking the stature of a criminal, a special chair which, when a prisoner sat upon it, made him assume a position in which he could be instantly photographed, apparatus for taking finger prints, and charts for recording the colour of the prisoner's eyes.

From Rouen to Dieppe is not a long journey, but three days they had to wait for a steamer, which was the last boat before the suspension of the service. The cars, of course, had to be left behind.

THE MIRA DYNAMO.

A simple form of electric lighting outfit is the Mira set, which includes the dynamo and head lamp. No accumulators are used, but an excellent light is given, which remains quite steady at all reasonable speeds. The falling off of the beam at very slow speeds is, of course, unimportant, as under the circumstances a brilliant light would not be needed. The dynamo may be driven from the engine or counter-shaft or rear wheel. On a clutch machine it should be driven, if possible, from some part of the transmission before the clutch, as the advantage of a good light is then obtained as long as the engine is running.

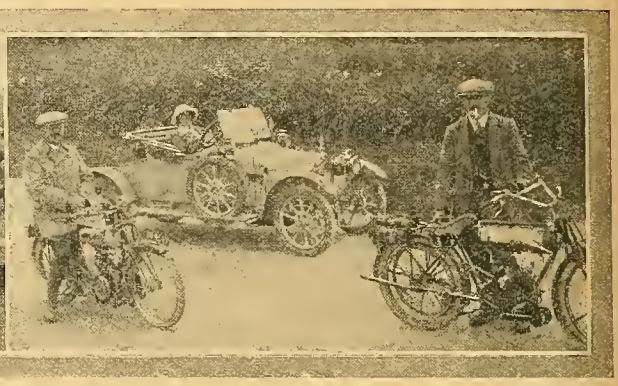


A neat method of attaching a Mira dynamo to a Douglas machine.

A TEST OF MAP READING.

A Thirty-three Mile Circuit of Coventry by Teams of Motor Cycles and Cars.

Group of members at the start.



The "A" team held up at a level crossing.

THE Coventry and Warwickshire Motor Club has had a busy time lately mainly as a result of the crisis. After placing about two dozen members' cars at the disposal of the War Office through the R.A.C., the committee met with the object of forming a rifle section, and, on Wednesday last week, practising commenced on the Humber range (thanks to the kindness of Mr. Niblett, the works manager), and will be continued each Wednesday evening until further notice. On Friday Mr. H. Whiteman, the secretary, gave a brief lecture on map reading, his remarks mainly being confined to the Ordnance map, and Mr. Tarrant (on behalf of the B.S.A. Co.) lectured on miniature rifles.

On Saturday afternoon, continuing the patriotic move, a test of map reading was held, which proved instructive and entertaining. At the starting point members were grouped into teams, motor bicycles being mixed with the four-wheelers, so that no advantage should be gained by a team of motor bicyclists on the narrow lanes.

A Bartholomew map, marked with a "tricky" course encircling the City of Coventry, was handed to each of the participants at the start, it being arranged that "A" and "B" teams should proceed westward to the outer edge of the route and then journey in opposite directions, and "C" and "D" teams travel eastward until picking up the circuit and then pursue opposite paths.

Thus the teams in journeying round the circuit acted as an automatic check upon one another, though mileage recorders in each team proved the distance traversed.
